I will just present the new advertising agreement in part Practically all of it has been rewritten, but in the main this contract is an agreement for advertising sauerkraut, made between the packer and the National Kraut Packers Association, by which the packer agrees to pay into this fund for advertising the sum of 50 cents per ton of cabbage cut into sauerkraut during the coming season, and the Association agrees on its part, providing that a minimum of $25,000 is subscribed, to proceed with its advertising campaign as it has done heretofore.

I take it as your intention that we proceed in making the motion that the Association go on record with this and decide to advertise during this year, adopt this contract the same as we have done heretofore. I make that motion.

The motion was duly seconded and carried.

The next matter taken up was the presentation of applications for membership. The name of the Perkins-Epeneter Pickle Co. was presented and by motion seconded and carried. Application of associate membership of the Cleveland Co-operate Co., motion was made an carried and they were duly elected.

The matter of working out a new plan to handle the production of the disease-resistant cabbage seed was presented. It was shown that as the old plan now stands, it only permitted the Department of Agriculture to serve a special interest, which is contrary to the rules governing the Department of Agriculture. For instance, as explained by the professors who have had the research in charge, matters of this kind must be done for all the people and not for just a few. That in their capacity they were only servants of and for the public. That pressure by outside parties had been brought to bear on their Department; therefore, they are asking for a solution of the matter.

After much discussion it was moved by A. E. Slessman that a committee of three to meet with the old seed committee to work out a plan that would be satisfactory to the Department of Agriculture. Seconded by Weller and carried unanimously.

At a later date the President appointed W. H. Knox, of the Wilson Packing Co., Jackson, Mich., Chairman; William Erdrich, of the Bellevue Kraut and Pickling Co., Bellevue, Ohio, and A. A. Huppert, of the Frank Pure Food Co., Milwaukee.

Thereupon the meeting adjourned.

FRIDAY'S GENERAL SESSION

National Canners Association, Ball Room, Hotel Statler, January 25 1924

JAMES A. ANDERSON, President, Presiding.

CHAIRMAN ANDERSON—The meeting will please come to order.

We will first have the report of the Committee on Membership, of which Dr. T. O. Goeres, of Wisconsin, is Chairman.

MEMBERSHIP

DR. GOERES—This Committee was formed about two months ago, and I am very sorry to say we have not a report to offer.

CHAIRMAN ANDERSON—We will next hear from our good old friend, Billy Roach, who will give the report on Refinancing, Advertising and Inspection.

RE-FINANCING

MR. ROACH—You have the financial report which was made by the chartered accountant, the American Audit Co., under date of January 15, 1924.

I might state that it was necessary to employ counsel to collect some of these accounts to show our friends who were not quite certain in their own minds whether they owed any or not, that it was a bona fide contract which they had made.

MR. BURDEN—I move the adoption of the report.

(Which motion was duly seconded.)

MR. ROACH—I would just say that this has been a hard, trying ordeal, and all I have to say is that I want to thank Mr. William Fromm and Mr. Dashiell and Mr. Frank Gorrell for the wonderful assistance I have had from them in trying to make these adjustments in making the collections that we have made. It seems that many canners who signed these bona fide contracts regarded the contract as rather a joke, instead of a bona fide obligation, and it was necessary, as I have said before, in order to get anything in the way of collections, to employ Judge Covington's staff, that wonderfully fine counsel, and his co-operation has been very helpful in collecting some of these accounts. I don't think we have sued anybody—perhaps we have brought suit against one or two, who, however, have paid up most of their accounts.

MR. CLARK—Before acting upon the report I move that a vote of thanks be extended to Mr. W. R. Roach by this Association for his work in cleaning up this matter.

(Which motion was duly seconded.)

MR. ROACH—Include Harry Stresbaugh and Richard Dickinson in that motion.

(Which motion was duly seconded and carried.)

CHAIRMAN ANDERSON—The next is the report of the Conference Committee, of which Mr. Roy F. Clark, of Wisconsin, is chairman.

CONFERENCE COMMITTEE

MR. CLARK—I came to this Convention with a rather lengthy report to make, covering the warehouse plan and setting forth just what steps had been taken to perfect its organization. Prior to coming to Buffalo we had a meeting at Chicago with the food officials, and the plan was discussed, or, rather, the warehouse plan was discussed, and the meeting finally adjourned again to meet in Buffalo. There were present representatives of the National Wholesale Grocers' Association, the American Wholesale Grocers' Association and our Conference Committee. The report is in a few words, and I will read you the resolution that was unanimously adopted:

> "The Conference Committees representing the National Wholesale Grocers' Association, the American Wholesale Grocers' Association and the Conference Committee of the National Canners' Association approve, as a principle, the canners' warehouse plan as applied to wholesale warehouse stocks only, as far as permissible under Federal, State and municipal food laws, and
>
> "Approve as a principle for the purpose of the wholesale grocer crediting the retailer for spoils which must be destroyed when and where found, that the wholesale grocer is to receive from the canner an allowance mutually agreed upon between wholesale grocer and canner at the time of purchase, or in the alternative the adjustment of such losses to be left to the contracting parties, and
>
> "Approve August 1st following year of purchase as the expiration of the guarantee period of sales for delivery from future packs and the period of six months on spot sales for both the wholesale and retail stock."

Relative to the last paragraph relating to the guarantee period, I want to say that was agreed upon prior to our meeting here in Buffalo, and, therefore, was incorporated in the final resolution. There may be some objection to that; there may be some objection to the entire resolution, but some particular objection to the last clause, and I call your attention to the fact that it was agreed upon at a prior conference.

I would like to say, Mr. President, also, that there has been a great deal of objection made by food officials of this country to applying the warehouse plan to stocks in the hands of the retailer. They make the claim that to return spoiled canned foods in small lots, one can, two cans or more, would be impossible; that they would not be able to have a check upon the same, and I think I can say that the concensus of opinion among all of the food officials is, it would not be practical so far as it affects retail stock. I think I may say that we will have the co-operation throughout the country of the food officials, so far as the plan relates to stocks in the hands of the wholesaler.

Now, I appreciate fully that so far as the wording of this resolution is concerned, the only practical progress we have made is so far as it affects stock in wholesale grocers' warehouses; but I do point out to you that that is a step forward in the interest of the public, that the very fact that we will have the co-operation of food officials, so far as this plan relates to the warehouse stock, and relates really to all canned foods, we have something that we have never had before. Now, so far as the Chain Stores Association is concerned, we met with the committee on Thursday. They made the point that this part of the resolution, referring to the warehouse plan, was not adaptable to their system of distribution, for the reason that they carried very small stocks in their warehouses. However, they made the statement that they would issue a bulletin to the effect that the Chain Stores Association was ready and willing and anxious to co-operate with the National Canners' Association in an attempt to ascertain the cause of spoilage, and I believe they will take the spirit of this resolution, so far as it relates to the adjustment of losses between canner and distributor, and will attempt, as I know the wholesaler will, to work out some plan with the canners which will be fair upon all and each of the commodities packed.

MR. CHASE—There is no man in this room more anxious to see harmony restored between the canners and the wholesale grocers than I am, and I think that the result of this work of the committee has been very gratifying, indeed. But there is one clause, as suggested by Mr. Clark, that might not be accepted by all of the interests represented in the National Canners' Association. We, of course, in California—and I think I might say on the Pacific Coast—are more interested in that clause changing the date from July 1st to August 1st than probably any other section of the country. It is something that, so far as I know, has never been discussed, neither at conferences which I have attended, nor has it been discussed by the California canners. It would, indeed, be a pity for anyone to attempt to change this agreement that has been arrived at after all these various meetings, but I do want to say this: that it would be impossible for Mr. McKinney and myself and others representing the California canners here, to accept that because of local conditions that exist there. It may be acceptable, personally—I hope it will be—but we cannot naturally sit here and hear this passed by unanimous consent without having to explain our situation, and the reasons why we consider it necessary to go on record at this time regarding that situation.

MR. ROACH—I, like Mr. Chase, am most desirous of the friendship of the wholesale grocer, and the confidence of the wholesale grocer and the chain store men as well. I have not any fight on with the canner, the wholesale grocer or the chain store men, and I don't intend to have. I know something in a small way about the conference that has been held betweeen the different associations, from the fact that one of my business friends is one of the Conference Committee. There has been a tremendous lot of hard work done, but it is my honest and candid opinion that August 1st of the year following the packing of the goods is a long way to guarantee any product. I take the same stand as Mr. Chase does. I do not think that we should be compelled to guarantee our products 13 months to August 1st. The history of this industry is this: When the industry was in its infancy, nobody knew very much about canned foods, did not know whether they were properly processed or not. Today we know, and we know, also, that there has not been very much trouble with what is known as swelled canned foods. The big cause of this is defective cans, and I am not, however, attempting to say that the canmakers are not giving us as good cans as it is possible for them to give us. Perhaps it is as much our fault as theirs.

When canned foods were first commercially sold there was a guarantee of six months, and that was before we knew what sterilization was. This business today is carried on under the supervision of the best chemists in the United States, and we know what time it takes to sterilize our products, and we know that our products are absolutely sterile, and to go now and extend the guarantee period from July 1st to August 1st, I think, is stretching it too far. I do not know of any product that is sold in this country that carries a 12 months' guarantee.

I was in Detroit the other night at the Automobile Show, and we stopped and looked at automobiles, and we stopped in front of one of the best makes of automobiles, and said: "What is your guarantee?" He replied: "Three months, ninety days." I am not trying to get from under any responsibility, but canned foods are sold to be re-sold and consumed, and if the retail grocer and the wholesale grocer buy our product, they should sell them. That is their business. I am not ready to put my O. K. on August 1st.

MR. BURNS—We of the Northwest approved of the warehouse plan unanimously. We approved of it on the understanding that the date was to be July 1st. bhe question of extending that time was not brought up to us, and I do not think that any member from the Northwest could in all honesty vote in favor of a resolution carrying that change. We would not feel justified in voting for the adoption of this resolution before presenting it to a meeting of our entire body of the Northwest.

CHAIRMAN ANDERSON—The question is the adoption of the Committee's report.

MR. MITCHELL—When issues arise between men we must always proceed on the ground that they are honest in their views. If there was not some principle at stake, there would never have been the question come up of the serious proportions that it has come up, with reference to this whole swell proposition.

Now, because of my trouble with my speech I have to come straight to the point and strike at the principle involved without any embarrassment or rounded-out favors. It seems to me that it is a proposition of the jobbers who want to protect themselves against the canners who are not straight, and the honest canners who want to protect themselves against the jobbers and distributors that are not straight goods. We might just as well acknowledge it first as last, because if it was not for that thing, the issue would not be up. This returning of the swells is a question of the doubting of a man's word. If you want them returned from me, you are doubting my word, and I have just as much reason to doubt your word as you have to doubt mine. Why should not these swells be paid for and permit them to stay in my hands? That is the whole issue, absolutely. That being the case, it is a matter of one trusting the other.

Now, then, we brought forth a plan, a compromise, by not asking that these swells be returned to the individual, but that they shall be returned on the warehouse plan proposed. But, now, here is where we are up against the real thing. The Federal law does not permit that to be done. I just want to draw a little issue with the Committee along that line, because if you would stick to the wording of this agreement made, we could not use the warehouse plan. It says, "As far as permissible by the Federal, State and municipal laws," which would shut us out absolutely. All we can do is to get down on our knees and beg the Federal, State and municipal food authorities to permit us to operate under the warehouse plan, and perhaps at this time that is the best we can do.

This Committee, I know, has worked hard, but they have had a pretty hard-boiled bunch to deal with, and it may be the best that we can get; but if it is the best, it is none too good at the best.

There is another phase of the thing which I do not like. Of course, when we have done the best we can do, that is all that can be done; but I do not like this big National Canners' Association now leaving the individual canners at the tender mercies of our friends when it comes to the clause which says that it may be agreed upon between the distributor and the individual canner. I do not like that, because in that way we lessen the prestige of the National Canners' Association. I do believe it would have been best, even though we could not have received a thing in return, to stick to the principle of the canners' warehouse plan, even though the Federal, State and municipal authorities would not have granted us one single concession. If the principle is right, I say stand by the principle until we have one, even though we have to wait until we can revise the laws that will permit the carrying out of the principle involved.

MR. MOORE—None of us can fail to agree with the sentiments expressed by the last speaker. The canners of this country have really only one view as to the handling of swells and spoils. Unfortunately the Conference Committee was confronted with a very serious situation, and out of the numerous conferences held I think there came the development of a thought which may ultimately work matters out along lines that will be extremely satisfactory to the canning industry.

In the first place, when we entered the conference I think none of us had any clean-cut distinction between swells and spoils that occur in the jobber's warehouse and swells and spoils that occur in the retail stores. We had very little thought about the factors which minimize the one and increase the other. Now, in our discussion with many of our jobbing friends the thought developed that there are two ways of handling canned foods by the jobbers in the Middle West and in the country sections. The jobbers, as a rule, test their stocks very frequently. They open a case out of a block of corn which has just been purchased from some canner, and they open perhaps several cases to see if any swells have developed. They do that at frequent and stated intervals, so that they will not send out to their customers any cases that contain swells. It develops further that that practice is not universal. Many jobbers, particularly those who have quick turnovers, rely thoroughly upon the canner. They have found canned foods so sound, as a whole, that they relieved themselves from all responsibility and did not test their stuff. Consequently, if a shipment comes in to that jobber who is living in the realm of quick turnover, rushing his goods out, he does not test those goods, and if trouble is developed, the trouble is passed along to the retailer in the developed zone, and the retailer, maybe, gets those goods that are not quite fit for consumption, and the danger comes to the industry. Because we all know that among the retailers are those who will not be too particular, and what we want above all is to keep those goods from getting to the consumer. We are not worried as to whether they are in our warehouse, or in the jobber's warehouse, or in the back part of the store; we are worried about them getting out to the consumer himself.

Now, it occurred to this Conference Committee—and I say that without in any way belittling the fact—that we were working along compromise lines, for we were; two great industries were fighting and fighting badly, and compromise was in the air; but when it was all done, let us think what has been accomplished. We have laid down the principle that as between ourselves and those with whom we contract, that the swells and spoils are ours, that they are subject to our control, and that we pay for them 100 per cent. Now, isn't that going to be an additional inducement to that jobber to test his stock, to separate those swells and spoiled cans, to change his practice, if he has been somewhat careless, and to gather together his swells and spoils so that they will never reach the retailer, and consequently can never go to the consumer?

Now, if we could stop right where we were when we approved the first principle, and assume no responsibility for shipments beyond that point, then we know that every jobber would work as hard as it was humanly possible to gather together those swells and bill them back to us, because from the time they pass from the warehouse to the retail trade he alone would be responsible, and consequently there would be mighty few spoiled cans that would ever go out to the retail trade. The best figures we have from the jobbers who test their stocks indicated less than 20 per cent of the total swells as taking place in the retailers' hands. One figure showed, I think, 13 per cent; another was estimated at 20 per cent of the total. We had other expressions that the great majority took place in the retailer's hands. I think we have a right to assume that the majority of the swells which occur in the retailer's hands have been due to the fact that the jobber has not used ordinary care in testing his stuff and passing out his swells as we do before we ship, before he ships his goods to the retailer.

I believe that while we could not work it out today, ultimately the canner's relationship will be with the jobber alone, that he will have full responsibility for all swells and spoils in jobbers' hands, and that the jobber will work out his program with his customer, for we know that many of his adjustments are not because of our swells and spoils, but of our competitors. In one market they will take back every dirty labeled can, will take back anything, simply because a competitor is doing it, and they have to retain the good will of the customer. Now, there is a difficulty whenever we go out into the relationship between the jobber and the retailer, but as far as the Conference Committee is concerned, as far as our industry is concerned, with the host of grocers asking for something they have wanted for years, asking for a radical change, the best that we could do was to prevent that change which had been made possible by food regulations and statutes, to stop that change at the point where it

was essential that the original practice be maintained for the protection of our industry.

And then when we passed along into the question of the relationship between the jobber and the retailer, and how we should handle that problem, why, we were simply in a maze. In one section of the country no jobber would accept even a large cash allowance in lieu of those swells, but prefers to rely upon the canner who has handled the matter fairly in the past.

Gentlemen, I have been somewhat active in Association matters during the past three or four years, and I am fairly well acquainted with the units in the canning industry. I have supreme confidence in the ideals of the canning industry, and in its ability to maintain those customs and practices that are part of its success; but as a member of that Conference Committee, looking forward to the year of 1924, realizing that this is a period transitory in character, brought upon us by changes in the food regulations, I could only fear that a delay in purchasing futures by those wholesale grocers who were at that time opposed to the National Canners' warehouse plan would be very detrimental to the canning industry. It was not that we feared that the masses of the canners would break away from what was recommended by the Association, but it was with the consciousness that there are always individuals whose circumstances, whose trade situation would not permit them to defer the sale on future canned foods to their regular customers. Now, I say that with the utmost deference, because my company might be one, Mr. Roach's company might be one, for you all know that there are a great many canners in the country who could not afford to protract a controversy if it could be adjusted upon a basis which retained the principle of full guarantee of canned foods and control of swells and spoils which were available for examination. You have never had swells and spoils of the retailer for examination in any volume. We have had some, we have had a very few real swells and spoils; those which we have had returned are those that developed in the jobber's stocks.

Gentlemen, I am prepared to say that if the Conference Committee had worked out no solution, if we had come before the convention without any solution whatever, there would have been a majority of the canners that would have stood by the warehouse plan; but there would have been a minority of the canners whose circumstances would not permit them to stand by the warehouse plan, and that minority would have been large enough to have disrupted an industry which has been brought together over a period of years, an industry which has gone and is going a long ways toward getting wonderful results in trade relations.

Gentlemen, the Conference Committee, right or wrong, felt that we must brush aside some of these objections which were stronger, perhaps, in our minds than in yours, that as long as we were protected in our right to control our swells and spoils, and to protect the public from the danger of their coming into consumption, that we could afford to go part of the way to work out an adjustment, and to get the distribution of canned foods for 1924 organized, because without that distribution being organized, production would have been threatened during the coming year.

Gentlemen, that is all that I have to say. There are details, there are things that none of us like, but we have not yet in business worked out an ideal situation that is ideal for every man. That is true of every industry, and it is peculiarly true of the canning industry, and it is my sober judgment that reflection will dictate the approval by every canner of the adjustment which has been recommended by the Conference Committee.

MR. ROACH—I know Roy Clark, and the efforts he has made, and I know all these men are honest men. I appreciate the fact of the work that your Conference Committee has had, and I am going to vote for August 1st because I believe it is the best thing for the standard of our industry. We want to place our industry where it belongs, and we want to take care of our responsibility, and I am willing to make the compromise and go thirty days further and make it August 1st.

MR. CLARK—I was not going to say very much with reference to this report in view of the fact that I am to act as your president in 1924, but I do want all sections of the country taken care of, and all commodities, as far as this Association can, and I make this suggestion, if I am in order: If this report is adopted with the last clause relating to the expiration of the guaranty, so far as it affects the digerent commodities, it be referred back to the Conference Committee for further discussion. I want to ask Mr. Chase if that would take care of the situation out in California?

MR. CHASE—I think it would, Mr. Clark. I do not want to be misunderstood in this, for there is no one who appreciates the work that this Conference Committee has done more than I do, but we feel that in view of the fact that we have not consulted with our people we could not be placed on record as approving this change of dates without taking it back to the Coast and finding out what the sentiments are of our people there. It was not with the intention of placing anything in the way of the approval of this report of the Conference Committee. It would, indeed, be a great pity if anything at this time should occur that would prevent the two great industries, the canning industry and the jobbing industry, from getting together and working once more in harmony. Our needs are absolutely mutual, and we cannot afford to have any disagreement occur between those two groups of business men any more than we could afford to have it exist between the departments in our own organization. But Mr. McKinney and I felt we could not be placed upon record as approving of something that has not been submitted to our group, and which we were not at all certain they would approve of, because we are more interested as fruit canners, and would be affected to a far greater extent, probably, than almost any other line of canned foods that are offered the public.

MR. McEWING—Like the gentleman from California, I do not care to make any expression that would have any effect upon the work which has been done by the Conference Committee, but I think I am justified in speaking for the State of Oregon, at least the fruit men of the State, being at the present time the president of that organization.

I know their feeling in regard to the guarantee of fruit, and I know that they would not approve of my sitting in this meeting with this matter up for consideration without my making some expression for Oregon, notwithstanding what my good friend Mr. Roach has stated. We are large packers in that section of fruit. The first thing we pack is strawberries, which we pack in June, and strawberries are the hardest thing to hold on account of defective cans, as the gentleman has said. The last thing we pack is pears, with which we have less trouble. If the guarantee of twelve months could be definitely settled on strawberries, good; but I would not think of a moment of going any further. But if we had to guarantee a period between different dates, or, in other words, a year for various items, it would be an entirely different proposition. I don't want to start any trouble, or spoil the effect of the work of the Conference Committee. In fact, I don't think it is necessary to kick the thing over. I think this can be handled through the Conference Committee. The Conference Committee has learned how to get along with the jobbers, and they have done remarkably well, and I think they can do some more. Oregon, if I may so state, will not go on record as in favor of this guarantee period.

MR. HILL—I think I fully understand the agreement as entered into and accepted by the parties at issue, but the point I wish information on is this: Should the individual canner desire to make an adjustment of swells and spoils, as heretofore, with the wholesaler and through them with the retailer, would the adoption of this report bar the member of the Association from making such an adjustment?

CHAIRMAN ANDERSON—No, sir.

MR. HILL—I might say while I am on the floor that the closest investigation our company could make to ascertain what was the percentage of swells was a quarter of one per cent, and it is my idea that we will continue to settle those differences that may arise from swells and spoilage as heretofore with the individual wholesale grocer, and our company, without having them returned to a central warehouse. I just wanted it understood that we have that privilege, even though it does carry.

CHAIRMAN ANDERSON—This will not interfere with your carrying through your own plan at all. Of course, the action of any association is only advisory.

MR. MOORE—We are all one large family, and we can think out loud, and I rise to make an inquiry. If this Conference Committee report is adopted without reservation, is there any reason why this convention should not later authorize the Conference Committee to open negotiations with other conference committees along the line of establishing guarantee periods which shall not outrun the beginning of the next year's pack? I am trying to say, there was only one argument for August 1st that came to my notice in our discussion, and that was that it was a sort of an average date to cover the beginning of the next year's pack. I remember specifically pointing out that it was not applicable to certain items, and immediately the prayer went up: "Save us from a schedule of time." I might say that while I do not see any grave dangers in making the reservation or taking any action that might discredit this program as we have adopted it, I can see no reason why a resolution should not be adopted authorizing and requesting and directing the Con-

ference Committee to reopen or take up the question of a scale of allowances applicable to the different products, etc.

CHAIRMAN ANDERSON—With the distributors' conference committees?

MR. MOORE—Yes, entirely independent of this matter, and I would like to get the judgment of our President and of our Secretary as to whether there would be anything in that that would indicate a controversial attitude on the part of our convention. I do not think we want to be put in the position of trying to continue any differences, and if we can in the spirit in which Mr. Roach made his suggestion waive personal feeling, I feel that there could be no reason why the convention could not later present to the various conference committees a proposition of a schedule of guarantee dates on the general principle that none of us wants to guarantee over into the next pack. I will say frankly, though, I do not believe there is anything sound in our guaranteeing a buyer to carry him through into the next pack, so that there is a multiplying of the guarantee. If there is no objection to that program, I would be very glad later to support a resolution of that kind, because I think it is something that ought to be done.

CHAIRMAN ANDERSON—I should say that such a program would be constructive and would be along the lines of harmonizing our efforts and bringing about results that we desire to accomplish in our organization, in our own industry, and together with the distributing industry, and I think there is no question but the distributors would welcome a conference along any constructive lines. We have always found them so; they are very good constructive business men, and the fact that they have disagreed with us at times does not mean but what they would be glad to confer with us on constructive lines, and I see no objection to such a program as Mr. Moore has outlined, and I think it would be welcomed by all. Are you ready for the question?

MR. McEWING—Did I understand that Mr. Moore suggested that a resolution of that kind would be presented at this meeting?

MR. MOORE—Yes, before the conclusion of this meeting, that formal positive resolutions be passed, showing our policy to be along that line.

CHAIRMAN ANDERSON—I take it that it would not be good faith on our part after the splendid work of the Conference Committee and what they have accomplished for us to here adopt a resolution that would affect the plan without a further conference and consideration with the wholesale distributors. We owe them that courtesy, and we owe it to ourselves to confer with them on this question that affects their interests as well as ours, and in a spirit of harmony and fairness I think that should be done, and the program as outlined, I think, is entirely in order and proper.

Are there any further remarks, or are you ready for the question? All in favor of the question will say "Aye." The report is adopted by an absolutely unanimous vote. Now the chair recognizes Mr. Moore.

MR. MOORE—I move that the Conference Committee of the National Canners' Association be authorized and directed to enter into negotiations with the Conference Committees of the various distributing associations to ascertain if it be feasible and equitable to adopt guarantee periods applicable to different items which shall not last longer than the commencement of the new pack of that item.

(Which motion was duly seconded.)

CHAIRMAN ANDERSON—If there is nothing further, I will put the question. All those in favor of the question will say "Aye," the contrary "No." The ayes have it and the motion is carried and the resolution is adopted.

We will next have the report of the Resolutions Committee, of which Mr. Richard Dickinson is chairman.

MR. DICKINSON—On behalf of the Resolutions Committee I beg to submit the following report:

RESOLUTIONS PASSED AT THE 17TH ANNUAL CONVENTION

Whereas, The interest and benefits of this convention have been greatly increased by the valuable addresses made at its sessions, be it

Resolved, That the thanks of the association be extended to Mrs. Julian Heath, Rev. Charles D. Brouthton, Mr. Ogden S. Sells, Mr. Charles P. Whiteman, Dr. C. A. Browne, Mr. J. W. Herscher, Mr. J. H. McLaurin, Mrs. Anna B. Scott and Mr. Philip A. DePuyt, and to other guests who have addressed the various section meetings.

* * *

Resolved, That the thanks of the National Canners Association be extended to the people of the city of Buffalo for their courteous and generous treatment on the occasion of this convention, and especial thanks to the Buffalo Chamber of Commerce and to Mr. Elmore C. Green, Chairman of the Buffalo Hotel Managers' Association, for the kindly assistance rendered.

* * *

Resolved, That we appreciate the services rendered by the various trade papers during the past year, and wish to acknowledge our feeling of obligation to them and to assure them of our continued co-operation.

* * *

Resolved, That authority be delegated to the Presidents of this and the allied Associations to fix the place where the next convention shall be held.

* * *

Resolved, That we are pleased to express our feeling of obligation to the Canning Machinery and Supplies Association, the National Food Brokers' Association and the National Retail Grocers' Association for their helpful co-operation during the year past and specially for their welcome and effective assistance at this Convention.

* * *

Whereas, in each succeeding year there has been evidenced in increasing measure the advantages of the constructive and co-operative relationships with the associations of the distributors of our products, promoted through the activities of our Conference Committee, and,

Whereas, the outstanding and gratifying result of the several joint conferences held during this Convention has been the dispelling of certain misapprehensions and misunderstandings, and the proportionate strengthening of bonds of good-will and mutual esteem, be it

Resolved, That we hereby felicitate the officers, representatives and membership of the National Wholesale Grocers' Association, American Wholesale Grocers Association and National Chain Store Association and record again our desire for even closer co-operation, to the end that each of our associations may better serve;

* * *

Whereas, the agricultural research work of the U. S. Department of Agriculture has been of great value to various interests of the canning industry, and,

Whereas, numerous State Agricultural Colleges and Experiment Stations have done research work of outstanding value to the industry on different canning crops; therefore, be it

Resolved, That the National Canners' Association in convention assembled this twenty-fifth day of January, 1924, does hereby express its sense of obligation to the U. S. Department of Agriculture and to the various State Agricultural Colleges and Experiment Stations for their valuable and interesting work, and hereby expresses the earnest desire of its membership that such beneficial work may be continued.

* * *

The National Canners' Association desires to record its earnest and sincere appreciation of the splendid co-operative spirit shown by the officials of the Association of National and State Food Officials during the recent negotiations between conference committees of distributors' organizations and the canners' organization. These food officials displayed great vision in appreciating the honest differences of opinion which had grown out of the different discussions and their fair and impartial attitude was most helpful in reaching a proper solution of these difficulties.

* * *

Whereas, beginning with a delightful luncheon and musicale on Tuesday, followed by most enjoyable trips to Niagara Falls and other points of interest and ending in a grand climax with the President's Ball on Friday evening of Convention Week, the ladies in attendance at our Buffalo meeting have been recipients of such boundless hospitality as has perhaps never before been extended under like conditions, be it

Resolved, That we hereby express to the members of the Canning Machinery and Supplies Association, our hosts on these occasions, our grateful appreciation of the cordiality so bountifully extended.

* * *

Whereas, the National Canners' Association since its incorporation has been unusually favored with the services of Frank E. Gorrell as its Secretary, who by his unexcelled ability, cour-

tesy and devotion has directed it from its small beginnings to its present position of importance among the great industries of the country; therefore, be it

Resolved, That this Association hereby expresses its appreciation and gratitude to its Secretary and that this resolution be inscribed in the records of the Association.

* * *

Whereas, credit for the growth, stability and success of the National Canners' Association is due largely to the unselfish efforts of the officers and directors of the Association,

And, Whereas, we have been fortunate in having as our presiding officer a man out of the West, whose worth and whose strength and whose optimism are typical of the great intermountain land from which he comes,

And, Whereas, he has during the year just closed given unstintingly of his time and talents at heavy sacrifice, made particularly notable on account of the great distance between his home and the centers of the Association's activities;

Now, Therefore, Be It Resolved, That the National Canners' Association extend to its retiring President, James A. Anderson, its sincere thanks and appreciation for the two years of resultful service which he has rendered to this Association as Vice-President in 1922 and President in 1923, and wishes him health, success and prosperity in all the coming years.

* * *

Whereas, since our last meeting our hearts have been saddened by the death of our former President, William C. Leitsch, and,

Whereas, his marked ability, energy, generosity, unfailing courtesy, genial friendliness and loyalty to his friends and to his own ideals won for him the admiration and affection of a host of friends as well as enabled him to render outstanding service to this Association, be it

Resolved, That we most sincerely deplore the loss of this true friend and capable leader, and that we extend our sympathy to his family and to his business associates; and, be it further

Resolved, That a copy of this resolution be engrossed and presented to his family.

* * *

Whereas, the co-operation of the various State Canners' Associations is of great value to the industry, and is a recognized support to the work of this Association, and,

Whereas, it is desirable that the present mutual understanding and co-operation be continued and strengthened; therefore, be it

Resolved, That the Presidents of each of the State Associations be invited to attend the meetings of the Board of Directors of the National Canners' Association, and that their traveling expenses in attending these meetings be allowed on the same basis as those of the members of the Board of Directors.

* * *

Whereas, the activities of the Association during the past year have resulted in a more friendly attitude on the part of many canners who are not new members of the Association, and,

Whereas, a substantial addition to the membership will naturally decrease the unit cost per member; therefore, be it

Resolved, That an active campaign for additional membership be undertaken based on the understanding that the directors will authorize a reduction of membership dues in conformity with the new membership received, but under no circumstances will any important function of the Association be curtailed thereby.

* * *

Referring to the recommendation made by President Anderson in his annual address, relating to zonal warehouses for spoiled canned foods, be it

Resolved, That we approve the agreement reached by our Conference Committee at this Convention, with the committees of the distributors' associations.

* * *

Whereas, it is believed that the best interests of the National Canners' Association will be furthered by having all research studies of the Association co-ordinated under the direction of one agency; therefore, be it

Resolved, That there be one Committee of Scientific Research to which shall be referred all present research and all questions relating to research that may hereafter arise.

* * *

Whereas, the improvement of the general quality of canned foods will result in increased consumption of our products and greater prosperity for the industry, and,

Whereas, quality has been the watchword of this Convention; therefore, be it

Resolved, That we earnestly hope that this watchword be carried home by all canners to be used as a slogan for the coming season, and be it further

Resolved, That we request the co-operation of the buyers for the various distributing agencies that they urge the production of better quality to the canners from whom they purchase, to the mutual advantage of both manufacturers and distributors of canned foods.

* * *

Whereas, the food broker renders a distinct service to the members of the National Canners' Association and all canners in the selling of canned foods, by which he earns a brokerage as compensation; therefore, be it

Resolved, That the National Canners' Association deplores any effort on the part of buyers to endeavor to buy direct and demand the brokerage that rightly belongs to the broker, and does hereby condemn the giving of brokerage to the buyer on the grounds that it is unfair to the broker and is unfair to all other buyers of our products.

* * *

Whereas, the burden of present taxation is felt onerously by all citizens and especially by the management of industry, and,

Whereas, the reduction of this taxation would proportionately relieve the present burdensome economic conditions and promote the general prosperity of the country, and,

Whereas, by proper economy in public expenditure it is possible to considerably reduce taxation; therefore, be it

Resolved, by the National Canners' Association in convention assembled this twenty-fifth day of January, 1924, That we earnestly urge that all forms of local, State and Federal taxation be substantially decreased wherever possible, and especially by rigid economy in all public expenditures, to the end that general prosperity may be promoted.

* * *

Whereas, the present conflicting State laws relating to child labor cause economic disadvantage to canners of various States, and,

Whereas, uniform Federal requirements would serve both social betterment and industrial advantage, and,

Whereas, an amendment to the Federal Constitution is necessary to the enactment of such Federal legislation, and,

Whereas, consideration of such a constitutional amendment is now pending in the Congress of the United States; therefore, be it

Resolved, That the National Canners' Association does hereby express its desire that such amendment may be promptly enacted, to the end that reasonable uniform Federal regulation may be secured.

* * *

Whereas, a census of agriculture has heretofore been taken only once in ten years, and,

Whereas, such intervals have been found too great to secure the best results in compiling statistics of agricultural production, and,

Whereas, agriculture and the industries closely related thereto comprise so large a part of the total industry of the nation, and,

Whereas, the agricultural industries have been in a critical economic condition in recent years because of abnormal and unbalanced market conditions, and,

Whereas, the census of 1920 was taken at a time when the above-mentioned abnormal conditions were most marked and hence the results of the 1920 census are not so reliable as those taken in normal times; therefore, be it

Resolved, That the National Canners' Association does hereby approve of a census of agriculture to be taken in 1925, and earnestly recommends to the Congress of the United States that a suitable appropriation be made for this purpose.

* * *

Whereas, plant diseases cause an enormous loss of important canning crops, such as peas, corn, tomatoes and beans, this loss annually amounting into the millions of dollars, and,

Whereas, the National Canners' Association needs more exact information on the distribution of these diseases in order that it may more wisely determine the best seed sources and the most desirable growing sections from the standpoint of freedom from disease, and,

Whereas, more frequent and more timely reports on the seasonal progress and severity of diseases in our crops is needed, and,

Whereas, the plant disease survey of the Bureau of Plant Industry is the logical agency to conduct this work for the Department of Agriculture, be it

Resolved, That the National Canners' Association herewith

assembled urge upon Congress the great desirability of providing for this work by increasing the allotment to the Plant Disease Survery through the addition of seventy-five thousand dollars, and be it further

Resolved, That since the agricultural appropriations for 1925 are now being considered by Congress, that this resolution be sent to the Congressional Committee having this appropriation directly in charge.

* * *

CHAIRMAN ANDERSON—I am sure we all appreciate the great task of this Committee in getting out these resolutions, and their earnest, honest, untiring efforts, and especially the efforts of the chairman, Mr. Dickinson, and I am going to call for a standing vote of thanks to Mr. Richard Dickinson, the chairman, and his Committee on Resolutions.

(Whereupon a standing vote of thanks was given to the Resolutions Committee.)

CHAIRMAN ANDERSON—The next is the report of the chairman of the Committee on Scientific Research, Mr. Henry Burden.

(This report of Committee on Scientific Research will be published later.)

CHAIRMAN ANDERSON—We will now have the report of the Finance Committee, of which Mr. James Moore is chairman.

REPORT OF THE FINANCE COMMITTEE

MR. MOORE—I have a very easy duty to perform, because the report of the Finance Committee is included in the detailed printed annual report, and you will find it on pages 20 to 23.

CHAIRMAN ANDERSON—The next is the report of the Foreign Trades Committee, and in the absence of Mr. Behr, Mr. Hollingshead, from the Department of Commerce, will make this report.

REPORT OF FOREIGN TRADES COMMITTEE

MR. HOLLINGSHEAD—As this report will be published in the various trade papers, there is no need for me to go into it at any length. The canned foods unit of the Bureau of Foreign and Domestic Commerce was devised and built up at the

(Which motion was duly seconded and carried.)

CHAIRMAN ANDERSON—The next is the report of the Committee on Raw Products Research. Mr. C. H. Sears.

(At a later date a detailed report by Director Woodbury will be published.)

CHAIRMAN ANDERSON—The next is the report of the Committee on Standardization of Tin Plate for Canners' Cans, by Dr. W. E. Elwell.

STANDARDIZATION OF TIN PLATE

DR. ELWELL—I gave an extended report on Monday evening, and since my address then the Committee has assembled and prepared a brief statement embodying suggestions that for various reasons have been submitted to the Finance and Executive Committees, and now rest with those committees for such action as seems to them expedient.

CHAIRMAN ANDERSON—I will just state that those who were not here on Monday evening certainly missed a splendid treat. It was educational and of great benefit, but you can read this report.

MR. BURDEN—I move the adoption of the report.

(Which motion was duly seconded and carried.)

CHAIRMAN ANDERSON—We will now have the reports of the chairmen of the various Sections. The first is the Corn Section.

REPORT CORN SECTION

MR. HILL—The Corn Section held a meeting yesterday morning, and there were some valuable papers read and information given. We had a very successful meeting, which seemed to meet with the approval of all who were present. We have suggestion of the former Foreign Trades Committee, headed by Mr. Bentley. The activities of that unit in the Department of Commerce have been based largely upon suggestions received from members of the canning industry, and particularly members of the Foreign Trades Committee.

At the present time we have in publication a pamphlet or circular on markets for American canned foods in South America, which also includes Central America. We are also preparing similar bulletins of markets for American canned foods in Europe, and a third bulletin to include the East Indies and Asia, and this will probably be published during the coming year.

Since the report was published, I don't know as I need to go into any detail. I do wish at the present time to extend to you all as individuals and as an Association an invitation to call upon us for any possible assistance that we can render, and specific requests for information will be filled as far as we can possibly do so.

MR. ROACH—I move the adoption of the report.

(Which motion was duly seconded and carried.)

CHAIRMAN ANDERSON—The next is the report on Pea Labeling, of which Mr. B. T. Cosgrove is chairman.

PEA LABELING

MR. COSGROVE—I have not much to report as regards any improvement in pea labeling. We are aiming at more detailed information as to the contents of the can, but this has been held up until definite standards and grades could be adopted, and I think Mr. Hunt will cover that in his report. I think with that as a basis during the coming year something can be worked out on pea labeling.

I move the adoption of the report.

no special report to make.

CHAIRMAN ANDERSON—The next is the report of the Pea Section. Mr. Hunt.

REPORT PEA SECTION

MR. HUNT—With regard to the Pea Section, I won't take up the time to read the report. It will be printed, and I merely wish to state that the Pea Section took up the question of standards and grades for peas, which was adopted at the sectional meeting yesterday, and it is up to the Board of Directors now to pass upon our action, and we believe that the action of the Labeling Committee will be had in due course; but it was held up on account of the rules and regulations adopted in the State of Wisconsin for us to see what benefits would accrue from that. You will be able to get my recommendations from the printed report in the paper.

CHAIRMAN ANDERSON—If there is no objection, the report will stand approved.

The next is the report of the chairman of the Tomato Section, Mr. Diament.

REPORT TOMATO SECTION

MR. DIAMENT—The Tomato Section held one meeting during the year, and that was in connection with the meeting of the Tri-State Packers' Association, at Baltimore last May. We had a very interesting meeting at that time, and I believe that these mid-year meetings are beneficial to the canners of the different Sections. We also had a very interesting meeting here on Tuesday, and several papers read and addresses given, which were very much appreciated.

CHAIRMAN ANDERSON—The report will be approved as given.

The next is the report of the Fruit Section, Mr. Reynolds.

REPORT FRUIT SECTION

MR. REYNOLDS—We had a resolution carried over from last year, so I won't take the time to read the resolution, but it is that an Advisory Board of regional directors shall recommend to the directors of the National Canners' Association to transmit knowledge of growing conditions in different sections. In the discussion at this session it was pointed out that the State secretaries in different sections of the country were contemplating organizing for work along the same lines and on account of that fact no action was taken. The research laboratory work during the last year and the year previous has been extremely valuable to the Fruit Section.

The subject of canned fruit labeling, which caused considerable discussion during 1923, was again considered, with no result.

CHAIRMAN ANDERSON—We will consider the report adopted as given.

The next is the report of the Bean Section, by Mr. Reicheldorfer. I do not see Mr. Reicheldorfer here, and will order the report accepted and filed.

The next is the report of the Kraut Section, by Mr. Wilder.

REPORT KRAUT SECTION

MR. WILDER—I am pleased to report that we had a very fine meeting yesterday in the Kraut Section. Next year it may be necessary for us to have a larger room. We were very crowded, although it was a nice-sized room.

Most of the activities of the Kraut Section are taken care of through the National Kraut Packers' Association, of which we had a meeting following the Kraut Section, which lasted from about 10:15 in the morning until 3:15 in the afternoon, so that you can rest assured we had a real meeting. The advertising propaganda will be continued for at least another 18 months. The new appropriation was assured yesterday, and I want to thank the National Association for all the courteous help which they have given us.

CHAIRMAN ANDERSON—The report will be approved as given.

The next is the report of the Baked Bean Section, by Mr. Merritt Greene. Mr. Greene is not here, and it will be approved as he would have read it.

The next is the Pumpkin Section, by Mr. Thorne. The same remarks apply to Mr. Thorne.

REPORT PUMPKIN SECTION

MR. DICKINSON—I did not attend all of the meeting, but the part that I heard was interesting and instructive. Dr. Woodbury gave a most interesting discussion of the various processes, etc., and there were two recommendations or resolutions approved by the Section, first, that all cans used be enamel lined. That was practically unanimously supported by all the pumpkin packers who were present. The other was the recommending of the use of No. 2½ cans for pumpkin instead of the No. 3 cans.

CHAIRMAN ANDERSON—Unless there is any objection, the report will be approved as given.

The next is the Beet Section, by Dr. Goeres.

REPORT BEET SECTION

DR. GOERES—We organized this Section last year, and had less than ten packers present, and this year we had more than 30 per cent, so we feel that the canners are taking real interest in working along the lines of standardization of grades in regard to the number of beets in a can, and intelligent labeling. Those are the two things we are taking up at present, and we have committees and are trying to work out a solution.

CHAIRMAN ANDERSON—If there is no objection, the report will be approved as given.

In the absence of Mr. Ralph Polk, the Grape Fruit Section will not be reported, and the remarks that I have made as to the other reports that have not been presented will apply to Mr. Polk's report as well.

Will Mr. President Roy Clark please come forward.

(President-elect Clark came to the rostrum amid applause.)

CHAIRMAN ANDERSON—I am not going to make an address, and I will appoint Mr. Gorrell as chairman while I make just a few remarks.

Mr. Chairman, ladies and gentlemen, it is a great pleasure to appear before you at the closing session of this convention, and let me say in starting out, in expressing my appreciation, that it has been a real opportunity for me, in the first place, to be sandwiched in between two great men—men of great strength and force of character and men full of integrity, sincerity, loyalty and truth and brotherhood. I refer especially to that great character who preceded me, Mr. James Moore, and to Mr. Roy Clark, who is to follow me, and I just feel as though I were sandwiched between two great characters, and their influence could not help but make a success of this administration. I hope you will just pardon me if I take the liberty of saying our year has been a success.

I want to say that it affords me more pleasure and more real gratitude than words can express to deliver now at the end of my administration of affairs as executive, to deliver them over to a man who is much better qualified than I, a man whom I can be proud to say will carry this Association on to a greater goal, to better thoughts and to better deeds, and to an entire and complete success. I know this because I have worked with this splendid gentleman, this loyal character, this real brother, if you will permit me to say so, and I have learned to love him, and I just feel that I can say he has learned to love me, because it was all mutual.

Just as I was coming in a gentleman handed me a little box and a list of names and told me what it was, and he said: "Jimmy, present this in your own way," and, oh! I felt weak to think that I had such a responsible task before me: "Whereas, the State of Wisconsin has been honored gain in the selection of one of her representative canners as president of the National Canners' Association, at this time it is fitting that Wisconsin's friends among the canners and others should show their appreciation of the honor conferred on Mr. Royal F. Clark by presenting him with a gavel, a symbol of his office."

(Chairman Anderson then presented President-elect Clark with the gavel from his Wisconsin friends.)

PRESIDENT-ELECT CLARK—I do not know how to answer my true friend Jimmy Anderson in the presentation of this beautiful gift on behalf of my Wisconsin friends; neither have I words to express my feelings at this time. I hope that the confidence that he has placed in me and that you have placed in me, the confidence expressed by this long list of names, will be justified by my service during the year 1924 as president of this great Association, and will be such as to make you feel that you have not made a mistake. I wish I could say more in appreciation of this gift which I will always cherish.

Jimmy and I have worked together for many years—worked together on the Board of Directors, then he president and I vice-president, and we have learned to know each other and to love each other. Jimmy is passing on, not from the activities of the Association work, but as president of this Association. And you are losing a good, great man, my friends, just the same as you have lost as president other great men in this industry. I hope, Jimmy, that God Almighty will spare you many, many years; that you may continue to work with me and with your many, many friends, in the upbuilding of one of the greatest industries in the world. (Applause.)

Ladies and gentlemen, I feel greatly the responsibility I have undertaken in accepting this position, and I likewise feel the honor that has been conferred upon me. I know that I cannot be successful, or even contribute to the success of this organization, unless I have the unqualified support and co-operation of each member of the National Canners' Association. But my acquaintance with you and my work with you convince me beyond question that you will meet me not only with the co-operation that is necessary to make the organization a success, but with your confidence, and I pledge you my confidence and all that is in me during the year 1924, and in the years to come every effort to bring the canning industry to a higher plane. We must recognize there must be an advancement in all trade organizations and in all industries, and I say now that I will try during this year to not only be president of the National Canners' Association, but to be president, friend and confidant of each and all canners of the country. (Applause.)

I desire at this time to recognize Mr. T. A. Scott.

MR. SCOTT—Jimmy, it is a great pleasure to me to have been selected to present to Mrs. Anderson through you a memento to show the appreciation of the Wisconsin canners to you for all the work you have done in the last year for them, and the interest you have taken, and we ask that you will accept this in token of their regard.

MR. ANDERSON—If I can control myself for just a moment, I would say that it seems to me that no more fitting tribute could be paid to that wonderful helpmate of mine than this emblem of purity, sweetness and loveliness. That good helpmate of mine is not here in the room, and, therefore, I want to say on behalf of the ladies that I owe my success next to the foundation that I spoke of in the first place to that wonderful helpmate, that loyal, good character, sweet and beloved Mrs. Anderson, who has stood by my side, and who through the long hours of the night has taken care of the little ones and been patient through the day and never complaining, has always made a sacrifice while Jimmy in the East or the West or somewhere was serving the public interests. And there is more credit due to that good little helpmate than there is to Jimmy for any success that he may have made. And so just let me offer this as my thanks and appreciation not only on her behalf, but all you good ladies, our wives, our wonderful wives and our wonderful helpmates. I thank you.

PRESIDENT CLARK—Just a word as to the work of 1924. It will be my aim to increase the membership of the National Canners' Association. We hope during the year to increase it in such numbers that we may be able to lower the dues. We can increase the membership very easily by making salesmen out of each member, and I intend to get out a letter to you all, asking you for a period of 30 to 60 days, to make salesmen out of yourselves and sell our organization to those who have not come in. I think I am safe in saying that we now have an income sufficient to take care of the activities of the Association, so that any increase in membership will naturally work toward a decrease of dues. It is, therefore, to your interest, and I will ask your co-operation during the period named, in getting in all of the canners, bringing them into the Association, not because we need to have a decrease of dues, but because we can get so much more out of the Association by having them all in.

I have said once or twice before since I have been in Buffalo that I am rather optimistic as to 1924, with certain qualifications as pointed out to you last evening by Mr. Phelps. I do not refer to all of the qualifications stated by him, but I would like to leave this thought with you before the convention adjourns. There is one qualification which is in the minds of every industry today, and that is **quality.** I read a very interesting article not long ago by an economist who stated that we did not need to fear the year 1924 or the year 1925; no one could predict 1926 and the coming years, but we did not need to fear the next two years for the reason that probably wages will stay at the same level and may go higher, and he believes that the wage earners of this country have come to the conclusion that it was best for all to reconcile themselves to compete more for the necessities of life, or the commodities that are in life. To my

mind, even though you bring the wage-earning masses to the point where they are reconciled to these high prices, they are going to demand quality, and it does not make any difference whether it be canned foods, whether it be apparel, supplies, building material, or anything else, if you are going to continue on the high-price level you will have to have quality. So let me ask you to go home from this convention with this idea, that we as the canning industry are going to make the rest of our lives during 1924 for quality.

I have appointed the Executive and Finance Committees, which I think you are all familiar with, but I have not had an opportunity to go into the subject of appointing the additional committees, and with your permission I would like to have a week or two to make a further study and then advise you of those appointments. But as it is necessary to have the Executive and Finance Committees function at once, I have appointed the following:

As the appointment of the Finance Committee has to be up for your approval, I will entertain a motion.

MR. HUNT—I move the adoption of the President's report as to the Finance Committee as he has read it.

MR. ROACH—I second the motion.

PRESIDENT CLARK—You have heard the motion; all those in favor say "Aye"; to the contrary "No." The ayes have it and the motion is carried.

(Whereupon, upon motion duly made, seconded and carried, the Seventeenth Annual Convention of the National Canners' Association adjourned.)

NATIONAL CANNERS' ASSOCIATION
Meeting of
BOARD OF DIRECTORS
Buffalo, Friday, January 25, 1924, 2 P. M.

CHAIRMAN CLARK—Is there a quorum present?

SECRETARY GORRELL—Yes, there are 23 present.

CHAIRMAN CLARK—I am delighted, indeed, to have you as the Board of Directors for the ensuing year. I know we will accomplish some real results.

SECRETARY GORRELL—It has been the custom for some time to have the Administrative Council make recommendations to the Board of Directors. However, the Board of Directors must pass finally upon these recommendations, and your action becomes the action of the Association. I understand, Mr. Secretary, that we have some recommendations from the Administrative Council.

SECRETARY GORRELL—The first is a change in the by-laws regarding the eligibility to membership, a change in Article 4, Section 1.

(Secretary Gorrell reads the by-law.)

SECRETARY GORRELL—The addition is, "sterilized by the use of heat and complying with the provisions of the Food and Drug Act of June 30, 1906, and the regulations issued thereunder."

Which motion was duly seconded and carried.

CHAIRMAN CLARK—We have a second recommendation from the Administrative Council, recommending to the Board of Directors that there be a special rate of membership dues established for what are termed non-seasonal products. These include pork and beans, hominy, silk, catsup, soups and other similar articles. The statement has often been made that the profit on such articles as pork and beans is so close as not to permit manufacturers of those commodities to pay the regular membership dues. On the other hand, the output is very large. The Administrative Council has given this question considerable consideration.

MR. CHASE—I would like to ask if that would affect the status of any present member of the Association to any extent?

Is there any recommendation as to what the change should be in the dues?

SECRETARY GORRELL—One-eighth of a cent.

MR. HERRINGTON—If a new man comes in as a member on this reduced rate, how about the man that is in who is also packing the same commodity?

SECRETARY GORRELL—That is the point Mr. Chase made. He would, of course, come in on the reduced rate on that particular line.

MR. MOORE—Mr. Bentley and I used to disagree very widely as to the question of these dues, but the feeling today, his feeling and my feeling, are exactly in accord that it would be desirable, from the standpoint of the Association, to bring in those items that have a share in the making of our problems. We have a common ground on which to stand. Every packer of foods in tin cans has one very important element in common, and I mean by that the difficulties and troubles that emanate very muuch in connection with unfavorable publicity and evryething else. The arguments that may apply to non-seasonal products, like lima beans, pork and beans, kidney beans, etc., do not apply to all condiments. There is, however, a condition that makes it necessary to do a great deal of advertising or a great deal of sales work in order to merchandise catsup, for instance, against the competition that exists on a higher margin of profit, and the man who is spending a very high percentage of his margin in advertising and sales efforts feels that that should be taken into consideration. The same thing applies to salad dressings. They have their own problems, but they are very closely allied and are common to our industry. Some of you may have more accurate figures than those I have, but the other day I was told that a review recently completed of the soup and pork and beans business of this country showed in excess of 16,000,000 cases of pork and beans, canned pork and beans. The figures on soup had not been compiled at that time, but in the large consuming centers, such as Chicago, where they have been completed, the consumption of soup was running double the consumption of pork and bans. In the smaller consuming centers the ratio was the other way, but the opinion I gathered was that the total consumption of soup would be from two-thirds to three-quarters the consumption of pork and beans. Those two items alone are very substantial. You all have some idea of the catsup business and some idea of the evaporated milk business and its volume. Now, we were very much impressed a few years ago by the arguments of the milk people, and we were all convinced that there should be a different rate. I am glad to say, and I am sure the milk people would feel the same, that in our deliberations we had not thought of making any special rate for the pork and beans people or the milk peopple, or any for the catsup people, and so forth. We felt we could not go into the minutes of the division of these different lines, but we thought the way probably was to take our present production, which is largely seasonal in character, aand take that as the full burden-bearing production, and then bring in these non-seasonal condiments, including silk and soups and so forth, that they did not need to be enumerated, and any other items of that character, and suggest a lower rate that would be somewhat in line with its overhead carrying capacity, because of the character of the production.

I might say, Mr. Chairman, that Mr. Bentley and myself discussed this considerably, and submitted it in this way, after the subject had been thought over and discussed in the industry for a long period. We may have some mental reservations ourselves, but this is the way in which we recommended it. We felt that it was a wise thing to do. Of course, we had the thought as to whether or not it was going to bring in a substantial block. There would be nothing in it unless those units came in groups. We would want a substantial volume, so that there might be, for xample, a catsup section for the catsup people, and so forth. The same is true of pork and beans; the sam will be true of milk and hominy and all those other items. I am prepared to say, as far as the interests I represent are concerned, and as far as our competitors with whom we are in touch are concerned, there is a general feeling that a closer association in some manner is exceedingly desirable for those units.

CHAIRMAN CLARK—As I understand, the recommendation as to dues for non-seasonable products is that the dues will remain at one-eighth of a cent per case. If the dues for packers of seasonal products should be reduced to a quarter of a cent under this resolution, these stay at one-eighth.

MR. MOORE—Mr. Larmon's suggestion is if the regular dues should go up above one-half a cent, that the non-seasonal dues should likewise go up in the same ratio of four to one.

CHAIRMAN CLARK—In the form of this recommendation we do not need to cover that, because the dues are fixed at one-eighth of a cent, and that matter could be left.

MR. MOORE—I think that is perfectly fair.

MR. VAN CAMP—I might state that I am packing 60s, 12s, 24s, 48s, 100s and 200s, and the value ranges from $2 a case to $30 a case. I was wondering just what had been done too establish the units.

SECRETARY GORRELL—A case has been a case thus far.

MR. VAN CAMP—It seems to me that that is a subject we might discuss; we should find out what is a case. Say, you pack tomato paste, 200 cans to a case, and you pack some other things that are 60 to a case, and sometimes the sixty cans sell for more money than the 200 sell for. Sometimes they sell for one-tenth as much. It looks to me that this should be sort of settled.

SECRETARY GORRELL—That discussion came up some two or three years ago, and it was answered by Mr. Moore, who seems to always have an answer for everything.

MR. MOORE—You remember that we had it up at the time of the inspection and advertising, and we had quite a fight on that matter in the city of Chicago. Of course, we know there is likely to be inequality.

MR. VAN CAMP—We have had trouble in getting our packages going, and we have deliberately sometimes cut our package to half or a quarter of the standard package in order to start the goods going. It would seem to me that because I suddenly reduce a package from 100 cans to the case to 24 cans to the case, that I should begin tomorrow paying four times as much to the Association as I paid yesterday.

MR. ROACH—I did not get an answer to my question. I asked the president when I came in as to whether you had had this up with the people interested, and I don't remember that I got an answer. Have you had it up with the milk people and the cream people as to whether they were receptive or not, and what htey thought would be perhaps a fair and equitable charge?

MR. MOORE—I think we all felt we were going as low as could be reasonably expected by any substantial interest in the canning industry.

MR. ANDERSON—I think that this is a good business proposition, and even though there is no absolute certainty that they will come in, we have great reason to believe that we will get a material increase, which will increase our finances, and what I think is of even greater importance is the fact that we get the entire canning industry into our Association, and the more we get in, to that degree we become more influential.

CHAIRMAN CLARK—All in favor of the recommendation will signify by saying aye; to the contrary, no. The ayes have it and the motion is carried.

There is a further recommendation by the Administrative Council, which recommends that the Board of Directors fix the membership dues for 1924 at half a cent per case, with the suggestion that an intensive drive for membership be made at once and continued with the expectation of getting an increase sufficient to enable the Board of Directors, at its May meeting, to materilaly reduce this rate; if this effort to increase membership is not effective, the dues to remain at half a cent per case for 1924.

I want to say that the Administrative Council also gave that recommendation very careful consideration. We all feel that a great effort should be put forth to increase the membership so as to reduce the dues, but at the same time we recognize the fact that we must continue to carry on the activities of the Association. If this resolution is passed, I hope that very canner here today, and not only everyone present here, but every member of our Association will appoint himself a committee of one to interview some neighboring canner and secure his application within the next 30 or 60 days. It will get out a letter to you as to when the drive will start, and see how many will get on the honor roll which we will have up in some conspicuous place at the time of our May meeting. I know I will get two in the next 24 hours, and I hope you will all be in the same position. I will entertain a motion in order to bring this up for discussion.

MR. MOORE—I move the adoption of the recommendation.

MR. ROACH—I second the motion.

MR. GREENE—Has any suggestion been made as to what the reduction might be, if a reduction were made?

MR. GORRELL—The more members, the more reduction.

CHAIRMAN CLARK—I think I can answer that by this statement, that we feel that we have enough income at the present time to take care of the necessary activities of the Association, and that from now on every additional member will tend to lower the dues, so that it depends entirely upon the number.

MR. GREENE—Would this be in keeping, if I went to a neighboring canner and said: "I would like to have you become a member of the National Association, and we will take your membership with the provision that if a sufficiently large number of members are secured, the dues will be reduced, and you will be a member on that basis?"

CHAIRMAN CLARK—That is a matter that should be discussed. Personally, I would favor it, but I am only giving you my own personal view, but I would favor the acceptance of an application upon that basis.

MR. ROACH—I dont know if that is wise or not. I don't think it is.

CHAIRMAN CLARK—We would like to hear from you on that.

MR. ROACH—The bone and sinew of this industry lies very largely in the success or failure of this Association, and therefore we should support it as liberally as possible. I belong to an Association that has got a surplus around $450,000 in the treasury. That is the Holstein-Friesian Association, and they spend about $450,000 a year in the furtherance of the Holstein cow and bull. Now we should make this Association so strong that no man can afford to be out of it.

MR. MOORE—Could not that be worked out very satisfactorily by giving a man the opportunity, letting him understand after he has handed in his application that if he wishes to recall it before it is acted upon, he can do so, if he does not find it satisfactory?

MR. GREENE—All I had in mind was this, that in our locality in Iowa, the greatest argument put up is that it is the expense that is keeping them out of the Association.

DR. GOERES—I am the chairman of the membership committee, and as soon as I noticed on the program that this question was going to be brought up, I took it upon myself to write each non-member in the State of Wisconsin to the effect that this matter was going to be brought up, and if I could take a lot of new names with me, that might sufficiently help to reduce the rate. Quite a few have spoken to me right here in Buffalo, and said that if they would rduce the rates they surely would come in. I told them that we could not assure a reduction in rate unless we were assured of a certain increase in membership. I think if we can take their application with the understanding that if we get a certain number of extra cases, that we will reduce the rates to one-third or one-quarter of a cent, and if we do not get a sufficient number we will have to leave it at one-half, and it is then up to them to wtihdraw, that we could make that arrangement.

MR. ANDERSON—I am in favor of that proposition. I can see a lot of gain and I cannot see very much loss. We have not got them anyway, and if they don't want to come in, we don't get them anyway, but we do get their promise on a proposition of that knid, that if the dues are reduced they will come in, and you get their application on that proposition. The psychology of the thing appears to me to be that you have made the effort and they have made the promise—you have anyway their partial promise that they will come in, and I think quite a lot of them would be very reluctant to give up and say that they would not come in. I believe you would be able to retain a lot of these, even if the dues were not reduced.

MR. ROACH—What would be the idea of the figure in reduction, You have to make a man some specific promise. I would rather go to him and sell him the proposition as a good business proposition.

MR. ANDERSON—So would I, if he could be sold.

MR. ROACH—Of course, we realize that many men in this industry are not men of trained business minds.

MR. McKINNEY—Would not the reduction be automatic?

MR. ROACH—What are you going to tell him?

CHAIRMAN CLARK—Tell him just exactly that there will be the reduction if we have the increase in numbers.

MR. ROACH—What increase?

CHAIRMAN CLARK—We are not in a position to say that we will reduce to one-fifth or one-quarter, or any other point.

MR. MOORE—Well, I would not hesitate to go out myself to people and say that we were making a drive for additional membership in the hope and with the confidence that we would get enough members to reduce the dues at least to three-eights of a cent a case; scale it in eighths. We must remember in addition to that, too, that this non-seasonal production, if we get it in, 20,000,000 cases may be big enough to make quite a little difference, which would mean quite a reduction in the dues. I would not cut the dues more than one-eighth of a cent anyway; it is a good cut for one year, and would be quite thoroughly appreciated.

MR. ARGO—Could we not make a sort of a scale that a certain number coming in, the dues would be dcreased accordingly?

MR. McKINNEY—Why could we not arrange it along the lines of a discount? Let your base be one-half a cent a case, and give a discount.

MR. MOORE—I think it is more a matter of sales presentation than anything else. I think I could go to a few people and say to them, "We have a program initiated which will bring in enough additional members so that the dues are going to be reducd to three-eighths of a cent. We may do better than that." I am not a bit afraid of tackling such a proposition.

MR. VAN CAMP—I think if I were going out to sell this proposition I would say, "We have a sufficient income, but it is not right and fair that a few of us should maintain this organization. You ought to join, no matter what the cost is. The present cost is half a cent a case, but if we succeed in increasing our income ten per cent as a result of getting new members, your bill will be rendered to you at ten per cent. discount."

MR. McCONAGHEY—I think Mr. Van Camp has hit the nail on the head. I think he has the right idea.

MR. STRASBAUGH—We seem to be talking without any figures in front of us, and I think we might as wll get the figures before us as to the total pack. I believe it is about 60,000,000 cases, say 50,000,000 cass, and half a cent gives $250,000. If we increase it to 60,000,000 at three-eighths of a cent, that is $225,000. Now, $225,000, of course, wonot go sa far as $250,000, so we would not on that basis decrease to three-eighths of a cent or even two-fifths.

MR. McCONAGHEY—I think Mr. Van Camp's suggestion is pretty fine. I think that we might work it along the same lines as the Canners' Exchange Insurance. Why could not some of you gentlemen who have been with the Canners Exchange Insurance sort of figure out a proposition so that the figures could be exact?

MR. VAN CAMP—Well, you wuold have to figure out the amount we have handed back, some $3,200,000.

MR. ARGO—I have just figured out what the saving would be here if you increased your membership by 12,500,000 cases; it would reduce your dues automatically on a percnetage basis one-tenth of one cent, and for every additional 12,500,000 cases it would reduce it that much.

MR. GREENE—I think Mr. Van Camp has a very good proposition. I think the non-members should be informed that the members of the Association are bearing all of the burden, and that it is the duty of them to join the Association, and that according to the number of new members, so the dues will be reduced.

There is another angle to that proposition. Say my pack would be 100,000 cases and the dues would be reduced to one-eighth of a cent a case. It is up to me to go out and help boost that membership because my dues would be reduced by about $125, and I could not earn $125 any easier than going out and inducing others to become members of the Association.

CHAIRMAN CLARK—I might state that the percentage reduction or percentage rebate, whatever you call it, is not covered in the resolution.

MR. BURDEN—Would it make it any easier if we sold this on an insurance basis?

MR. VAN CAMP—I am not trying to force my ideas across at all, but I think that the non-members should have it pointed out to them that the burden has been borne by the members of the Association, and it is up to them to become members.

MR. GREENE—Along that line, take the extreme, if we increase our membership 50 per cent; on that basis there would be 50 per cent. reduction on the membership. Would not that limit the amount of our income?

MR. McKINNEY—That is only during the period of the drive.

CHAIRMAN CLARK—You understand, gentlemen, that the recommendation does not conflict with the discussion we have had this afternoon. It simply states that the dues will be reduced, as is contained in the recommendation as I read it to you.

Are you ready for the question? All those in favor, say aye; to the contrary, no. The ayes have it and the motion prevails.

I want to state to you now, gentlemen, that we will have to send out invoices for the one-eighth of a cent under the rule, as we must have income. We have to live between now and next May, and any reduction can be applied at a later season.

MR. MOORE—It is up to the entire membership to get busy and help to increase the membership. Outline our policy and do the best you can along this line.

CHAIRMAN CLARK—There is one correction I wish to make in connection with the appointment of the committees. As I advised you this morning, I would appoint the various committes very shortly. I did, however, name the Executive and the Finance Committees, and in place of Mr. R. I. Bentley, of California, on the Executive Committee, I wish to appoint Mr. Elmer E. Chase.

MR. GREENE—Where will the next meeting be held?

CHAIRMAN CLARK—Either in Chicago or Washington, I suppose.

A motion to adjourn is now in order.

(Whereupon, upon motion duly made, seconded and carried, the meeting of the Board of Directors of the National Canners Association adjourned until May, 1924.)

CANNED FOOD PRICES

Prices given represent the **lowest** figure generally quoted for lots of wholesale size, usual terms f. o. b. Baltimore (unless otherwise noted) and subject to the customary discount for cash. ****Many canners get higher prices for their goods; some few may take less for a personal reason, but these prices represent the general market at this date.

Baltimore figures corrected by these Brokers: (‡) Thos. J. Meehan & Co. (†) Jos. Zoller & Co., Inc. (§) A. E. Kidwell & Co. (*) Howard E. Jones & Co. New York prices corrected by our special Correspondent.

EDITORIALS

THE CONVENTION—You have probably noted that we did not make the usual introductory to the big Convention report in this year's issue, but opened the report just as the Convention itself opened—in fact, with its very words, and carried right through in the order in which the meetings were held. There are two good reasons for this. In the first place, we have commented, in previous issues, upon the big Buffalo Convention and its effect upon and meaning for the industry, and in fact this effect has already been felt by the industry, although its complete meaning to the canners of every kind may not be fully realized for some months. In the second place, the speakers at the meetings and the deliberations have furnished a degree and quality of thought provoking discussion which we are not so conceited as to believe we could improve upon. Therefore, we let the reader into the matter without hindrance or delay.

Certainly there is enough in this one issue to make any intelligent canner read and study for many days and nights, and we urge all that they give this matter their careful consideration. It is rich in valuable information for every man connected with this industry, whether canner or not. And yet there will be observed some notable omissions, as, for instance, Dr. Elwell's constructive and all-important address upon tin plates, and there are others. We have withdrawn them from the report because we want to insure them the careful attention they deserve, just as we have already published some of the principal addresses. Not that those addresses which are included here are not important, or even less important, but if we had jumbled them all together under this one cover, there would have been such a huge mass of too rich matter for any business man to properly digest. That is what too often happens—the things which ought to be read carefully and thoughtfully are passed by because the reader sees too much. If there is one thing more than anything else which the canning industry needs it is more attentive reading. When the entire industry reads better it will be better posted, and being better posted will be a better industry.

We consider it better to give these importan matters in such shape as will insure their carefu reading than to strive for the empty claim that th "convention is given all under one cover."

THE CANNED GOODS EXCHANGE PRO GRESSES—Possibly one of the best busines sessions which the old and deeply respecte Canned Goods Exchange has ever held was held o Tuesday, February 12th. The Executive Committe had some really constructive propositions to place be fore the Exchange, and the Exchange eagerl adopted them and will stand back of them to th man. The first of these is to issue a Monthly Bul letin. This Bulletin will be devoted to the further ance of the canned foods produced by members of th Exchange, and be a faithful reporter of market condi tions, crop developments and other matters havin a direct effort upon the canned foods market, fro the canners' point of view. Its constant aim is t give the real conditions, uncolored and exactly a they exist, the full truth always. Naturally its mis sion will be to give the lie to the too oft-repeated as sertion that Baltimore canned foods are poor canne foods. They are no more so than might be said o almost any other section, but it gained its reputatio from some unscrupulous canners who no longer ex ist, but which its enemies will not allow to remai buried. The Bulletin will feature Baltimore good as they are, and by what canners produce them.

Another matter was the creation of a Credit Bu reau wherein will be listed the slippery and the slic —the unfair trader—and which will be participate in by all members and be at the disposal of all suc members. The day is doomed when the unfair tra der will find Baltimore canners easy picking.

A still further move was toward the creation o a central point for the assembling of "pool cars." This has long been a troublesome matter, and th new plan promises to simplify it materially.

And so we see this fine old body moving toward improved methods in its business; of becoming mor use to its members, and it is freely predicted that thi is only the beginning. We expect to see the Exchang go on to still more progressive efforts, and to mak for itself a very prominent place among the live-wir Associations of the industry.

The Markets

BALTIMORE, FEBRUARY 18, 1924

WEEKLY REVIEW

Market Conditions and Prices the Most Important—Spot Tomatoes Not Moving From Retailers—Jobbers Buying From Each Other—Future Tomatoes Moving—Some Growers' Prices Heard—Corn Gaining as It Cleans Out—Adjustments on Swell Claims.

SITUATION GOOD—In spite of all the mass of Convention matter, as important and as interesting as it undoubtedly is, all canners will turn to the market conditions as the real all-absorbing topic. Canners will come to Conventions and spend the week in talking with fellow-canners and will listen most patiently to the speakers, but the one thing each one of them really wishes to know is: What is the market; what are the holdings; what are the prospects, and what the indications for business in the near future. They have been fed up and overfed on factory improvement and upon technical questions relating to production; but, like all other humans, they are most keenly interested in the things which affect their pocketbooks or their bank accounts. And so this market division of the paper is necessarily added to this big Convention report.

TOMATOES—It is said that spot tomatoes are not selling from the retailers' shelves as rapidly as they should, and progressive canners are looking toward an advertising effort to make them more in keeping with other canned foods. A contribution to Canned Foods Week is needed from every tomato canner; and then a good, big, effective effort on the part of every tomato canner to have his local papers and sections know that Canned Foods Week is on, and that canned tomatoes are the leading staple of them all. Left to themselves, canned tomatoes are not the kind of food that will advertise itself and make a rapidly growing market. When the tomato canner wakes up to the fact that he has a right to do something toward moving his productions into consumption, and has no right to sit down idle and expect the brokers and the wholesalers and the retailers to sell his goods for him, we will hear no such complaints as the above.

Spot tomatoes are being largely traded in between jobbers—those having good holdings, which they bought at lower prices than now prevail, are taking their profits, and the fellow-jobber buyers find they can buy to as good advantage this way as from first hands. As a result, spot tomatoes have been quiet, but firm, the holders showing no loss of confidence in the goods. All the market recognizes that tomatoes are good property, and the jobber, buying under his new system of taking just such goods as he needs, adding his profit to the price paid, and buying again when forced to, is resting just as easy. Tomatoes will be cleaned up before new goods can come upon the market, but there is not much chance of a flurry in them, it would appear.

Future tomatoes have been traded in fairly well. The market was upset and the canners were heard to loudly complain of some very low prices quoted by canners' agents. Indiana is reported having nearly sold out its futures at rrom 15c to 20c above Tri-State prices. And sales of big blocks of goods in New York State, as futures, were reported at $1.85 and up. Such sales are making other tomato canners sit up and take notice. The future market has generally been considered, in this section, as between 90c and 95c on 2s, $1.30 to $1.35 on 3s, and $4.00 to $4.25 on 10s. But when these sellers see others getting better prices, they naturally feel inclined to boost their prices. Quotations by agents, therefore, do not rest easy, especially when they names prices ranging from 5c to 40c under these prices for the different sizes of goods. It matters but little that the canners for whom they are sold want to get some futures on their books for trading purposes. The fatality, if not the absolute assinity, of selling a mass of futures at or below cost—to get them on the books—with the intention of evening up, or "averaging up," by other sales later in the season, has come home to all thinking canners. Secretary Hoover has said that a sale at or below cost is unfair competition, and the Secretary was certainly very moderate and conservative in his terming of such an act. No canner has any right to sell any futures at a price which does not promise a profit under normal conditions. And no jobber asks any canner to do that. All the jobber asks is that you do not sell him at one price and then sell his competitor at a lower price.

There are some rumors of growers' prices having been named, and in some sections the canners report having made arrangements at about $15 per ton on the Peninsula. Over in New Jersey they will pay $20 per ton up to September 1st, and then $15 per ton thereafter. In Indiana the growers have banded together to hold up the canners, and are demanding $18 per ton, but they have not come to a decision as yet.

CORN—The West is so well cleaned up of spot corn that the market prices are advancing and the holders gaining a better opinion of their goods with each passing day. Iowa, Illinois and Indiana have about cleaned out of corn, and from Ohio comes this report: "Unsold stocks of corn in Ohio now total less than 75,000 cases—all grades and varieties. Of this amount less than 50,000 cases are of standard quality. This grade is now priced at 95c and $1.00, f. o. b. factory. There are possibly 10,000 cases available at the lesser figure. Fancy corn is closely sold up."

Now the buyer looking for 90c corn goes a-bagging, unless he comes East and finds some of the trades which one hears of at times. But even here the holders are stiffening their backbones and asking better prices. These market prices remain unchanged.

Stories are plentiful as regards canned corn this week. It is said that Minnesota has bucked Maine on quality and walked off with the order. That is a story good enough to give all corn canners pause. Then, the entrance of Golden Bantam into the

corn list at $1.80, while other corn is selling far below it, gave other corn canners food for thought. Shoepeg corn formerly was somewhat king of the roost. Most, if not all, of this is packed in Harford county, Md., and not a great deal at that. There has always been a very ready market for all the good quality shoepeg corn that was ever canned, and pretty much at the canner's price. In fact, those canners did so well, the other story goes, that last year, after paying the growers $15 per ton in the field—cutting it and hauling it themselves—they voluntarily gave these growers $2 per ton more, which made the price about $20 to $22 per ton for the corn. This year they are said to be offering the growers the $17; but whereas they got about $1.50 for the corn last year, they opened the future market at $1.40 this year, and have been cutting each other's throats until the price is now about $1.35. The buyers, of course, are laughing themselves sick over it, and why shouldn't they?

PEAS—It would seem the buyers of future peas have not been satisfied as yet, and are trying to get orders through for carloads of straight standard No. 4 Alaskas and No. 5 sweets; but the canners cannot see them. The market has moved up to $1.15 for such, but the canners say they could get $1.25 if they would take the orders. It is generally understood that most canners are well sold up on futures, but, of course, this does not mean that the future market on peas is closed. There are always some open for last-minute business.

A feature of the week has been further meetings of the Conference Committee on the matter of the swell question in New York City. The idea was to fix something definite in regard to the percentage to cover the occasional can in the retailers' hands. Reports say that all hands were agreeeable to a definite division of the goods into four classes. The first, including peas, beans, corn, succotash, etc., to allow 2/10 of 1 per cent. The second class, in which would be tomatoes, 4/10 of 1 per cent. The third class, including all acid fruits, seed fruits, etc., 6/10 of 1 per cent, and the fourth class yet to be determined upon. The chain stores took part in this and expressed their determination not to ask any allowance, but to insist upon repayment in full for all losses. The meeting was to hold its final session on Saturday, February 16th, in New York, when the matter will probably be adopted.

NEW YORK MARKET

Wholesalers Meeting Here This Week—Good Future Business in Tomatoes—Indiana Holding Spot Tomatoes High—Future Corn Selling Well—Minnesota Contesting With Maine—Peas Strong on Both Spots and Futures—Notes.

By "New York Stater,"
Special Correspondent "The Canning Trade."

New York, February 14, 1924.

ANOTHER Convention—New York has its own convention this week, the New York Wholesale Grocers' Association holding its annual meeting at the Hotel Astor. Numerous topics of interest to the jobbing trade are featured, the open forum on trade problems being a unique part of the meeting. The convention closes with a banquet at the Astor. Many of the brokers are spending part of their time at the hotel to interview out-of-town jobbers here for the event, and Hudson Street consequently is rather quiet.

Future Tomatoes—Maryland tomato canners have done a good future business during the week. Some of the larger and better known packers are now booking on 100 per cent contracts. A circular from a leading Southern broker this week lists future offerings from the following well-known canners: Kenton Canning Co., of Kenton, Del.; W. H. Neal & Son Co., of Hurlock, Md.; Clay M. Webb, of Vienna, Md.; H. N. Baldwin, of Chestertown, Md.; Tilghman Canning Co., of Tilghmans, Md.; John S. Cooper, of Hebron, Md.; Robt. Jarrell & Sons, Goldsboro, Md.; Geo. R. Caulk & Sons, of St. Michael, Md., and Insley & Mitchell, of Salisbury, Md. Canners are quoting 1s at 57½ cents, 2s at 87½ cents, 3s at $1.27½, and 10s at $4.00.

Indiana Tomatoes—Indiana tomato canners are practically out of old pack tomatoes, and are holding the market firm at $1.10 for 2s and $1.50 for 3s.

Spot Tomatoes—A quiet routine market for spot tomatoes ruled during the week. Peninsula canners continue to quote on the following basis: 1s, 65 cents; 2s, 92½ to 95 cents; 2½s, $1.30; 3s, $1.37½ to $1.40; 10s, $4.75, all f. o. b. cannery, for standard quality. Canners continue to display very firm views on the situation and are confident of a demand that will clean up their holdings at full prices when the spring buying movemen commences.

Future Corn—Western corn canners report a considerabl volume of business on future corn, particularly fancy quality Fancy Minnesota corn has become, perhaps, the strongest com petitor of fancy Maine corn, and has sold in competition wit the Maine product in this market, which is quite a feat whe the great difference in freight rates from Minnesota and Main is taken into consideration. Buying of standard corn on futur contracts has been only fair. While canners continue to quot on 1923 pack corn at present prices, buyers see no incentive fo them to go deeply into the future situation. Southern corn can ners are getting a little business on futures, but most of the interest appears to center on spot stocks for early shipment Chain stores continue to feature standard corn at 10 cents a can at retail, and are getting a good business on this basis.

Asparagus—Buying of new pack California asparagus on the basis of opening prices named two weeks ago has been rathe quiet. Prices are high, and distributors are not inclined to stock up too largely in advance.

Peas Strong—The pea situation is strong, both on spots and futures. Wisconsin packers are able to offer only one or two sizes, and are not offering in large quantities on any sizes on future contracts. Buyers who are still faced with the necessity of covering on their early business are consequently looking to other markets for supplies. Maryland canners are now quoting on the full line, the market being as follows: Standards, in No. 2 cans, 1 sieve, $1.00; 2 sieve, $1.50; 3 sieve, $1.25a1.30; 4 sieve, $1.15a1.20. Extra quality No. 2 tins, 1 sieve, $1.70; 2 sieve, $1.55, 3 sieve, $1.35, 4 sieve, $1.20, all prices f. o. b. cannery. They are reported to be booking some orders on this basis.

Maine Futures—Maine canners are offering future stringless beans at $1.30 for 2s and $6.00 for 10s, cannery. Corn on future contracts is quoted at $1.45 for 2s and $7.25 for 10s, with Golden Bantam at $1.70 for 2s and $8.50 for 10s. Buyers are not in the market in a large way as yet, and are investigating reports of sales at lower prices before taking any action themselves.

Peaches Stronger—A firmer undertone is noted in the local market for canned peaches, particularly standards, and offerings in the resale markets are not large. Jobbers are carrying but light stocks, and are picking up desirable offerings wherever available. Further advances are looked for in this market before the 1924 pack will be ready for distribution. Continued export inquiry is reported from the California market.

Salmon Quiet—Outside of the routine increase in retail buying for the Lenten season, trading in the salmon market has been quiet on all grades. The Coast situation holds about steady, with some factors predicting a sharp advance in the price of pinks during the next thirty to sixty days. Reds are rather closely held, and are well maintained.

Notes of the Trade—E. L. Heebner, of J. M. McNiece & Co., left this week for a visit to the Coast.

Deming & Gould Co. have appointed Dudley & Weisl their brokers for the New York, Philadelphia and Boston markets.

Col. Richard Bell-Irving, of the Anglo-British Columbia Packing Co., of Vancouver, B. C., was in the market this week.

W. R. Morgan and E. A. Simon, of Greenabaum Bros., Inc., of Seaford, Del., were in the market a few days ago.

Royal F. Clark, of Beaver Dam, Wis., new president of the National Canners Association, was in the market this week.

Victor Carroll, of the Townsend Co., canners, of Georgetown, Del., was among the out-of-town canners here during the week.

Sanford & Timpson have been appointed New York sales agents for the Alaska Consolidated Canners, prominent Alaska salmon canners.

CHICAGO MARKET

Corn Going Well—Central West Tomatoes Cleaned Up—Futures Going Slowly—Buyers Do Not Like 2½ Tin—Some Canners Sold Up on 1924 Pack Peas—Big Demand for California Fruit—Extensive Preparations for Canned Foods Week Are Under Way.

Chicago, February 14, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

THE Market—Since my last communication the weather has moderated, and for nearly a week now, has been of such a temperature that the shipping of canned foods has been active, and quite a congestion of orders for all kinds of canned foods has been relieved. Wholesale grocers' stocks have been

reduced accordingly and buyers have been compelled to display more interest in replenishing their stocks than for some time previous.

Canned Corn—This article has been selling rather freely, and the demand seems to be especially for standard and extra standard—fancy grade being neglected. There are only a few lots of standard corn in the Central West to be had at 90c f. o. b. cannery. Nearly all the holders, except in a few instances, have advanced their prices to 95c f. o. b. cannery.

Canners seem to be confident that all their spot holdings of canned corn will be needed and in urgent demand before the output of 1924 will be available, and are therefore inclined, not only to maintain prices, but to look forward to the prospect of advancing their prices.

In futures, canned corn is selling in an unimportant way. Most of the big Illinois canners and some of the large Iowa canners have, as is customary with them, contracted with their regular customers for private label purposes; but the smaller canners and the smaller wholesale trade have not sold or bought futures freely in canned corn and will not do so for a while.

Canned Tomatoes—The supply of caned tomatoes in the Central West is practically gone. The few lots that are left in the hands of Indiana canners and Ohio canners are held at prices above the market. These prices may be obtained after a while, but just at present, buyers are placing their business with Maryland and Delaware, where canned tomatoes can be bought proportionately, freight considered, at about 5 or 10 per cent lower cost than in the Central West. Utah and California, tomatoes are not coming to Chicago in any important way, as the higher freight rate from these localities prohibits their use just at present, or until prices should advance somewhat higher than at present.

Buyers do not like the No. 2½ cans as used in Utah and California, almost exclusively, for canning tomatoes. Our consumers have become accustomed to the No. 2 and No. 3 can and retailers do not care to go to the trouble of introducing the 2½ can. They have to be retailed at a higher price than the No. 2 cans, and if they sell as a substitute for No. 3 cans, the consumer thinks he is being short-weighted.

Future tomatoes are scarcely selling at all. Buyers are not disposed to contract for them because they think that the opening price is too high, and that there is a strong prospect that a lower price will prevail as we get farther along into the season. Even in fancy grades, there is no disposition to place future orders. It has been customary heretofore for wholesale grocers, who use their own labels on canned foods extensively, to contract for a supply of fancy 2s and 3s tomatoes early in the season, as that grade must generally be packed to order.

Canners do not like to pack fancy tomatoes, as the difference in price which they receive as compared with standard and extra standard grades does not pay them for the care, pains and handling that must be utilized in packing the fancy grade.

The canners say that packing fancy tomatoes, which must be selected red ripe from the general run of stock that comes to the canneries, deteriorates the standard and extra standard grades, and makes it more difficult to sell and obtain a price for them.

Canned Peas—A few sales of spot canned peas have been reported the past week, altogether from Wisconsin canneries where they have been held in winter storage with a hope that prices would materially advance toward spring. Prices have advanced and the canners, who are holding such lots of peas, are inclined to sell them at the advanced prices and get them out of the way of their preparations for canning in the spring; and to get the money and utilize it for seed and for purchase of cans, etc.

In contracting for peas for future or 1924 output, the business has been more important than many supposed; and quite a number of canners have already sold up to their capacity for 1924 delivery. The larger houses have not bought heavily, but the buying in futures has been very general, and most of the smaller wholesale grocery houses have bought up to their full prospective requirements.

This was the case at this time last year, and it resulted in an early almost entire clean-up of the largest output of canned peas ever produced.

The Metropolitan jobbers did not believe, at this time last year, that any considerable portion of futures in canned peas had been sold; but events prove that such had been the case, and the large buyers later in the season were puzzled and troubled to find canners who were in position to accept contracts to supply their needs. It is probable that this program will be duplicated again this season.

California Fruits—A very fair demand is arising for canned California fruits, especially for apricots and peaches. The statistics from the Pacific Coast of the output for 1923 have convinced buyers that there will be a shortage in the supply of yellow cling peaches, apricots, Bartlett pears and Royal Ann cherries.

Although the prices for California fruits are high, much higher than they were in 1913 and 1914, and retailers say that on account, the demand from consumers is slow, still an enormous shortage in the staple kinds of fruits will make it quite possible for dealers and canners to close out the pack, even at the present high prices.

Contracts for California fruits for 1924 delivery are reported to be much smaller than anticipated and probably smaller than at this time last year, but the strength of the statistical situation on the Pacific Coast will soon attract the attention of buyers, and contracting will then doubtless begin.

Michigan Fruits—The supply of Michigan canned cherries, berries, peaches, pears, etc., is very small in canners hands, and consists almost entirely of small or broken less than carload lots. A few canners have some Michigan canned fruits stored in warehouses, holding them until spring and for a better price; but such supplies are not large and are off the market.

The State of Michigan at present is snow-bound, and transportation throughout that state is very much embarrassed. The protection of the snow throughout Michigan will, however, almost certainly insure a good fruit crop—unless the orchards are subjected to unprotected conditions and freezing weather later in the spring.

Michigan canners have named their prices for future delivery on peas, stringless beans, beets and several other articles, but have not yet, generally, named prices on fruits for future delivery. Price has been named on R. S. P. cherries in No. 10 cans, f. o. b. Michigan cannery, at $9.50 per dozen; but this is the only price so far that has been announced.

Canned Foods Week—Extensive preparations are being made for the observation of Canned Foods Week, not only in Chicago, but in all the principal towns and cities of the Central West. For illustration: A letter from South Bend, Indiana, tells of practical demonstrations of the value and merit of canned foods at luncheons, to be given all during Canned Foods Week, March 1st to 8th, by the Rotary Club, Kiwanis Club, Chamber of Commerce, Optimists' Club, Women's City Club, University Club, and one or two other organizations at different times and on different days during the week.

Illustrative lectures or talks will be made at luncheons held by these organizations. This is a practical way of educating the people in relation to the merit and value of canned foods. It is mouth-to-ear advertising and it is more valuable than all the other kinds of advertising combined. Inspiring the people of a community, who are leaders of thought and custom, with confidence in canned foods and the canning industry, is the truly effective method of largely increasing the demand for the products of the great industry.

ST. LOUIS MARKET

Business Is Improving—Trading Shows More Confidence—Stocks in Jobbers' Hands Getting Low—Selling Off Tomatoes Before Further Buying—Futures Quiet—Peas Improving in Buyers' Minds—Corn Is Growing Firmer—A Little More Interest in Fruits.

St. Louis, February 14, 1924.

By "Missourian,"
Special Correspondent "The Canning Trade."

THE Market—Business in canned foods appears to be improving. There is a better feeling prevailing between the packers and the distributors and there is more confidence. There is a strengthening in prices and buyers seem to show more of an interest that have heretofore been neglected. There is a better demand for all kinds of canned vegetables and the prices are firmer. New interest is also being shown in the majority of fruits. A few however are neglected. The cause for the betterment in the situation is undoubtedly the fact that stocks in the hands of jobbers and distributors are being sold and it will be necessary to replace depleted stocks in many lines.

Tomatoes—While there is a fair demand for shipments from the factory for immediate use, buying for replacement is not extensive. It is believed that the dealers have plenty of stock in their own warehouses and they wish to unload this before they add to their holdings. While country points state that there is only a very moderate amount of the 1923 pack left unsold, it is thought that distributors have more than they have been given credit for. This opinion is expressed because they are not buying in a big way. The price for raw material for the coming season pack has not been settled on. For this reason opening prices on the finished product are more or less conditional. There has been some acreage contracted for in the Tri-States at twenty-five cents a bushel or fifteen dollars a ton, about the same as paid in 1923, it is rumored.

By the last of this month, it is thought that enough acreage will be contracted for to pretty well set the price. Prices that have been on the basis that raw material will cost about the same as last year and an allowance has been made for the increase in cost of cans and cases. Southern futures are considered too high to attract attention and dealers are inclined to wait until the season advances before committing themselves.

Peas—The situation as to peas is unchanged. Everything points to an early cleanup of 1923 pack. There is no inclination to sell freely when the goods will be needed later on and cannot be replaced, or they are being held for advances. This applies to the cheaper grades rather than higher grades. There does not seem to be a surplus in any grade of No. 2s except small lots. No 10s are already pretty nearly sold out. Future trading is being done, but cautiously. There are some difference in the reports as to the sale of Wisconsin futures. Some brokers state that first class packers are completely booked up on certain grades, while other brokers say they can get through contracts and while their clients are not clamoring for business they are not turning down offers. Spot peas of all grades are scarce and are causing higher prices. Each makes the scarcity of cheap lines more noticeable as stocks are being cut down. Buyers find they cannot insist on a special brand and in many instances are glad to get what they can if they can get it only in small lots. On Sounthern futures, buyers are going rather slow because of the high ideas the packers from that section have. It is stated that the higher Southern prices are, because peas mature early in the South and can be put on the market fully a month earlier than the Wisconsin peas and packers are able to take advantage of the extreme shortage of goods in the consuming market, which is predicted for the windup of the 1923 crop year. Buyers, however, are a little shy on Southern futures.

Corn—Country points are developing firm ideas on standard corn. A healthier consuming movement is reported, although buying is mainly for transit wants. Standards moving more freely in consumption than in several years. Fancy packs from all districts are wanted and cannot be had, unless full prices are paid, and even then the offerings are limited. The shortage of Maine fancy corn has caused consumers in the east to turn to Minnesota packs and there is now considerable competition. Minnesota is producing some fine canned corn, and this is being recognized in the eastern trade more extensively than formerly.

Miscellaneous—Asparagus, which has been offered rather on new quotations, of futures has rather a limited call. Lima beans have been farming better.

Fruits—There has not been much activity in canned fruits. The California line is now being inquired for than for some time, but distributors and packers cannot get together as to prices, and inquiries do not amount to sales. That they will result in trading later on is certain since jobbers are investigating the market and are finally coming to the conclusion that offerings on the coast are less extensive than realized. Yellow clung peaches in standard and choice grades are hardening and there are no free sellers. Apricots are steady and in fair demand. Pineapple is not moving in a big way. Apples are being held with confidence. Prospects of a shortage of all California fruits due to the extremely limited rainfall, appears to have created an interest in certain varieties of California fruits. Fancy gradings are being sought, while there is a more liberal inquiry for standards goods.

MAINE MARKET

Market Quiet—Futures Arouse Much Interest—Help Is Hard to Get—Prices on Future Corn—Stringless Beans—Apple Pack Exhausted—The Maine Canners' Association Holds Its Meeting.

Portland, Me., February 15, 1924.

By "Maine,"

Special Correspondent "The Canning Trade."

THE Market—General trading in local markets is very quiet, indeed, with only day-by-day buying and no heavy stocks on hand. It is the expressed opinion of everyone, however, that this condition will gradually change for the better, that business will soon be up to normal, and that the new condition, built on a solid base, will be lasting. Futures are proving interesting to jobbers, and the quantities already contracted for give earnest to the above prediction of good business in the near future.

Future Corn—Maine corn canners are now interested in future sales, and are finding a welcome in all markets. Some, in fact, have already gone to market, and report a very good business, indeed. Future Crosby corn is selling at $1.45 for the No. 2 size, with $7.25 the price on No. 10s from the few who care to handle this article. Golden Bantam is $1.70 and $8.50. These prices have been well maintained, and tentative efforts on the part of buyers to secure better figures have met with a firm refusal. Several firms are now sold up; one man states today that he has taken all the orders he dares risk until weather conditions become settled, and all who have offered future goods return like reports. The price of cut corn to the grower has necessarily been advanced this season, and even now the labor condition in rural sections is so acute that acreage each season grows less certain. Help is not merely high—it is absolutely lacking. And here in Maine, where the best corn land is in rolling fields and side hill land, and corn has to be hand cultivated and harvested, labor is a very important consideration, indeed. While it is already assured that the 1924 acreage will be sufficient to care for all the business taken, the matter grows more serious each passing season.

Stringless Beans—As usual, this item has been marketed coincidentally with future corn, and has likewise had a good reception from the buyers. The price seems to be universal at $1.30, with $6.00 set for No. 10s. The larger size, however, is difficult to handle successfully, and offerings are less plentiful than in other years. Beans in No. 3 cans have been put on the market to a limited extent for the past two seasons, and seem to meet with the approval of certain restaurant and hotel buyers. The recent exhibit by the Maine Canners' Association at Buffalo evidently tended to increase interest in the particular variety of stringless beans used in Maine, and the result is already apparent.

Apples—This is usually about the beginning of the season for cleaning up spot stocks of canned apples, but this year finds the market already about bare. With many months yet intervening before the earliest of early fruit comes in, it is very plain that the present small supplies can by no means meet the demand. Holders are rather indifferent at this time, not wishing to put their goods out until the price advances in the spring.

Sardines—With very small stocks at the beginning of the winter, the only wonder is that today some canners still have small amounts on hand to care for current demand. This, of course, is only possible because of the hand-to-mouth buying of the last few months. While preparations are already under way to make ready for the season which nominally opens April 15th, it is doubtful if future goods are priced out for some time yet. As for that, it is extremely doubtful if the season does open on schedule, as it is usually well into June before the fish begin to "run" in quantities to make operations profitable—and sardine canners have learned better than to open their factories until that time has actually arrived.

Notes—Hon. B. M. Fernald has been in Maine this week, and addressed the Lincoln Club of this city on its birthday supper February 12th. That a prophet has no honor in his own country is disproved in the case of Mr. Fernald, who is always most eagerly welcomed here.

The Maine Canners' Association held its regular meeting yesterday at the Congress Square Hotel, with a representative attendance. Future prices and operating conditions were discussed and plans got under way for assistance in Canned Foods Week work. The outlook for 1924 on Maine canned products is encouraging, and the trend of feeling is optimistic.

CALIFORNIA MARKET

Crop Outlook Is Brighter—Farming Operations Being Rushed—Situation Serious From Drought in Some Sections — Most Canners Have Named Asparagus Prices—Some Have Named Spinach Prices—Higher Prices Offered for Peach Crop—Pear Growers Meet—Interesting Notes From the Coast.

San Francisco, February 14, 1924.

By "Berkeley,"

Special Correspondent "The Canning Trade."

OUTLOOK Bright—Northern California has been visited by another rain, and the situation, from the standpoint of the grower, is much brighter than it was a couple of weeks ago. The storm centered around San Francisco Bay, but reached all sections of the State north of here. The rainfall for the season at San Francisco is slightly more than 40 per cent of the normal to date, not a very satisfactory showing, but one far ahead of that made in Southern California. The last storm was sufficiently heavy to enable farmers to commence farming operations and work is being rushed. The situation has assumed a serious aspect in the lower San Joaquin Valley and in the southern part of the State, but with rains falling in the northern section, it is likely that relief is at hand. Practically no snow has fallen in the high mountains and the outlook is for a scanty supply of water for irrigation.

Asparagus—The tentative prices named on the 1924 pack of asparagus by the California Packing Corporation under date of January 28 were followed the next day by tentative prices by Libby, McNeill & Libby. Here and there a difference of 5 or 10 cents a dozen is noted in the two lists, but in the main they are practically identical. Considerable business is being booked, as asparagus is one of the items which is never packed in sufficient quantities to meet the demands of the trade, and buyers wish to cover their requirements as far in advance as possible. This year's prices are a little higher on some grades of tips and green asparagus than those of last year, but in general there is little change. The warm rains that have been experienced since the first of the month have been of great value, and a good size pack seems in prospect.

Spinach—While some interests named opening prices on spinach several weeks ago, prices have not been named by the large operators, and the volume of business done has been comparatively small. The breaking of the protracted drought has improved the crop prospects materially, since the bulk of the California pack is made in the territory tributary to San Francisco. Opening prices on this canned vegetable are expected at an early date from the California Packing Corporation and other large interests.

Fruits—Growers of canning fruits in Sutter and Yuba counties, California, are well pleased with the manner in which last year's pack has moved off, and with the tendency of canners to offer higher prices for canning stock. One of the large canning concerns is in the field making offers of $35 a ton for sling peaches for a period of five years, with a proviso that if the market price is advanced, the company will pay 85 per cent of the increase. Last year grocers received $30 a ton, and canners were not anxious to buy even at this price. They did not enter the market until well along in the summer, and the fact that they are now willing to contract for fruit is regarded as significant.

Pears—The first annual pear growers' convention and demonstration in Alameda county was held at Hayward, February 8, under the auspices of the California Pear Growers' Association. The gathering was really a continuation of the recent fruit conference held at Berkeley and was the first of a series of fourteen such events to be held during the year in the various counties of the State where pears are grown extensively. E. K. Strobridge, of Hayward, acted as chairman, and the program included talks as follows: "The Relationship of Banker and Grower," William T. Knightely, manager of the Hayward Bank of Italy branch; "How to Improve Alameda County Pears," Arthur Manter; "What the Grower and Buyer Wants," Joseph Lemos, representing the Pacific Coast Canning Co.; "The Canning Industry," Harry Howell, representing the California Packing Corporation; "The Pear Growers' Association Work," Frank T. Swett, president and manager; "Community Interest of Banker and Grower," I. B. Parsons, president Bank of Hayward; "Pear Distribution," Wilmer Seig, secretary and manager, California Fruit Distributors; "Standardization," F. W. Read, manager of the Standardization Department, California Fruit Exchange, and "The Advantages of Education Fruit Advertising to the Housewife," Mrs. Pauline Partridge, of the Domestic Science Department of the California Pear Growers' Association.

Coast Notes—Joseph Durney, president of the Haiku Fruit and Packing Co., which operates pineapple plantations and a cannery on the Island of Maui, T. H., reports that, despite the fact that the pack of this concern was a comparatively light one, amounting to but 490,000 cases, the showing in a financial way was the best yet made by this concern. This showing was made possible by the splendid prices secured. "The Outlook for 1924 is excellent," said Mr. Durney, "spot business is very good, and while it is, of course, too early to discuss prices—they are usually determined in May or June—the increasing demand from England and Continental Europe is most reassuring. We are anticipating an increase in the pack this year to approximately 600,000 to 650,000 cases, as against 490,000 cases last year."

An interesting turn in the demand for canned pineapple of late has been the increased call for shipment of this fruit to Germany. By the time this product is laid down in Germany and the duty paid, the cost has mounted up to about 50 cents a can, or double the cost in the United States, but there is a call for it, and the quantities consumed are steadily increasing.

The Maui Agricultural Co., which now has 270 acres in pineapples near Makawao, T. H., is preparing to plant 500 acres more this year, and eventually plans to have 4,000 acres in bearing. H. A. Baldwin, manager of the company, denies that a cannery is to be erected on Maui, but states that negotiations are under way for the shipment of the fruit to a packing concern at Honolulu.

The Price Canning Co., of Oakland, Cal., which made a decision last year to enter the vegetable-packing field, has abandoned this plan and will continue to devote its energies exclusively to the canning of fruits. The plant at San Leandro is being overhauled and the storage facilities enlarged.

Preston McKinney, secretary of the Canners' League of California, was expected home from the National Convention by this time, but had been delayed at New York by a press of business.

The Kelley-Clarke Co., San Francisco, has been appointed brokers for the specialties of the Gorton-Pew Fisheries Co., Ltd., of Gloucester, Mass., packed in tins.

R. M. Hoey, formerly with the Kelley-Clarke Co., San Francisco, has joined the buying staff of Tillman & Bendel, with which firm he was associated years ago.

The jury hearing the case of the Pratt-Low Preserving Co. against Dr. C. W. Evans, a fruit grower, of Modesto, Cal., for alleged violation of a ten-year contract to deliver canning peaches, found it impossible to agree on the amount of damages and has been dismissed.

SMILE AWHILE

"Does your wife always have the last word?"
"No, indeed. I have it. It's 'yes.'"

Rastus—If yuh had de chance, would yuh go up in an airplane?
Rufus—Neider would yuh.

A CUTTING REMARK

"No getting around it—there's one guy you've got to take your hat off to."
"Who's that?"
"The barber."—Sun Dial.

Frater—The maid only broke one dish over at our house today.
Frater No. 2—How did that happen?
Frater—It was the only one left.—Green Gander.

NATURAL MISTAKE

Algy—What do you mean by telling Joan that I'm a fool?
Percy—Heavens, I'm sorry! I didn't know it was a secret.—Black and Blue Jay.

"Where did you go last night?"
"Out riding with father."
"I didn't know your father had a car."
"He's a street-car conductor."—Green Gander.

"So you sent a dollar for that advertised appliance to keep your gas bills down. What did they send you?"
"A damn paper weight."—Flamingo.

A cannibal's existence depends upon his ability to pick men that agree with them—Moonshine.

CLEVER

Wife—How can you stand lying in bed so late in the mornings?
Hubby—I don't stand lying in bed. I'm no contortionist.—Black and Blue Jay.

Lady—My! But doesn't travel bring out all that's in one?
Experienced Traveler—Yes, especially ocean travel.—Green Gander.

He—I'm from Bermuda.
She—You look big and strong.—Punch Bowl.

"I hear Bill's taking up spiritualism."
"What? That stuff that makes the tables hop around? I thought Bill was more practical-minded than that."
"But that's just the point. Bill's in the furniture-moving business."—Pelican.

"I hear that Hank had an accident."
"Yes, some one gave him a tiger cub, and told him it would eat off his hand."
"Well?"
"It did."—Wampus.
"That was a bad slice," said the golfer as he lay sick from eating his wife's bread.—Harvard Lampoon.

"Yes," said his proud mother, "John is such a good boy, and so fond of dumb animals. Why only last night I heard him say in his sleep, 'Feed the kitty, feed the kitty.'"—Bison.

There was a thin maiden called Lena,
Who bought a new vacuum cleana,
But she got in the way
Of its suction one day
And since then nobody has seena.—Wasp.

Mrs. Newbride—Well, Henry, if anything goes wrong, I will always be able to keep the wolf away from the door by singing.
Mr. Newbride—There isn't the slightest doubt of that, dear.—Lemon Punch.

EDITORIALS

SWELLS WORKING OUT—We are glad to report in this issue what seems to be a very satisfactory solution of the long controversy over the settlement of the Swells Claims matter. You know the Buffalo Convention opened with both sides standing firm for their plan of settlement, the canners contending that it was their business and that they had a right to reclaim and pay for their goods as they thought best, and the jobbers, on the other hand, protesting that they would accept no plan except the flat allowance, and upon the terms which they dictated. Business men, however, do not deal in such a childish way, and so it is not surprising that when they met in conference the jobber saw the right and justice in the demands of the canner to follow and settle for his goods and to know why they went wrong, if he chose to know this. And, on the other hand, the canner quickly recognized the difficulties confronted by the distributors in getting back every last single can for such examination. And so they met and agreed, the jobbers to accept the Warehouse Plan for canned foods as far as the stocks in jobbers' warehouses, and the canners to allow a suitable allowance for the single cans found in retailers' hands, after the goods had passed out of the jobbers' hands.

At Buffalo most canners considered that this compromise was, in reality, an abject surrender on the part of the canners to the jobbers, contending that the jobbers would secure, in this new allowance, all that they had ever asked under the flat allowance plan, and more; and it was even rumored that officials of the Wholesalers' organizations had instructed their members to secure this cash allowance on every swell claim before returning the goods to the warehouse. This, of course, would have annulled the whole procedure and left it in worse condition than before. But here is a good example of how unreliable Old Dame Rumor is in nearly every instance. Business men of the day know that business is done upon the solid foundation of good faith; in fact, there is nothing a business man more keenly detests than the man or concern which seeks to be "slick," who has to be watched. No man wants dealings with that kind of a man, or firm, or association. They resemble too much the snake in the grass, and no human being has ever been able to warm up to a snake. The jobbers saw the canners were in good faith in their offer; that they had a high ideal in wishing to get bad canned foods off the market promptly and surely, and the jobbers joined the canners with equal good faith in this desirable work. The single can in the remote retailer's hand was a real situation and not a mythical one, thrown in to accomplish an ulterior motive. And so long as the canners continue to guarantee their goods until consumed, the only way this could be satisfactorily settled was to have the situation realized and meet it. This they have done, as the account referred to shows. Even this small allowance may be too much for many canners, because of the almost perfection with which they pack them, and carefully sort out before shipping, but it is a penalty they will continue to pay so long as they adhere to the antiquated method of guaranteeing the goods out of all reason, and it is the best that can be done under such an unfavorable condition. The trouble lies with the methods of the canners, not with the method of settlement. Most other lines of industry have marched so far ahead of the canners, in their methods of marketing and distributing their products, that the canners cannot even be seen in the dust down the road, and it is time the canners awoke to this fact, and took steps to correct it and to get up to date. Other lines of industry do not have to call upon their associations to adjust settlements for faulty delivery. Such matters are settled quickly and satisfactorily because there is a personal contact between the seller and the buyer; where men meet eye to eye there is little opportunity for misunderstanding. Establish that personal touch between the producer of canned foods and the distributors and these misunderstandings and bickerings will all fade out as mist before the sun. The buyer wants to meet the responsible canner, direct and without interference, as he does in every other line which he handles, the one who has the authority to act and settle matters promptly. The less involved the transaction the smoother the dealings, and the quicker the settlement of disputes. It must be so.

Efficient methods of production, scientific studies of processes, improved means of crop production, cost accounting and other features are all highly important and valuable, but what this industry needs now most of all is improved marketing methods, a wider understanding of market conditions and possibilities and a more personal, intimate following of the goods through all channels of distribution to the consumers.

CANNED FOODS WEEK—The big week of the year for the industry is almost at hand. The week when all the world will be told, in particular fashion, about **your** goods is here. What have you done for it? Have you contributed any small amount to the expense? Are you going to sit by me while a stranger comes into your warehouse, takes your goods out and shows them, and explain their merits to the consumers you must reach if you expect to continue canning foods? Most of you are doing just that! The party is put on for you; to help your business and you are taking no part in it. Did ever the world see such a spectacle?

Last year about 10% of the canners contributed anything, either in money or co-operation, towards Canned Foods Week. Is that record to be duplicated this year? It will be if you do not, or have not, sent your check to the Canned Foods Week Committee, National Canners Association 1739 H St. N. W., Washington, D. C. All that you are asked to give is $10 per line of canning machinery operated. A one-line plant, $10; two-line plant, $20, and so on. The wholesale grocers are spending a small fortune to increase the consumption-sale of your canned foods; they're in this Canned Foods Week, with sleeves rolled up and working hard, everywhere in the country. And the brokers are working with them. The retailers will put on the show; hundreds of men will lecture before clubs and assemblages, all telling about the merits of canned foods, and urging their greater co-operation, making more business for you. The least the canners can do is to co-operate towards the expense of the Week by contributing the small amount asked. They ought to go out and join these lecturers; to visit big retail stores and address the consumers there, cutting goods and feeding the audience; to appear before their churches and clubs and explain—just tell the real story of canned foods, and how they are produced. The whole world is hungry to know the truth about canned foods; the story is the most interesting one that could be told, and who should tell it if not the men who produce the goods, the canners? But do it!!

THE BEET SECTION—The reporter's transcript of the Beet Section got mixed up in the heavy storm around Chicago and dribbled in to us in such a fashion that we had to drop it out of its orderly position in the big Convention issue, and so having gotten out of step, we left it for this issue. There is yet to be given an account of the many amusements at the Buffalo Convention, and it is due the generous machinery and supply men who played hosts at these features that they be fully described, and they will be next week. You have had so much Convention that we thought to give you a rest. We have never known our subscribers to be so intent upon a Convention report as this year. They have been buried in it ever since last week, and are only just looking up! They have all the business of the Convention, now for the pleasure.

ARE YOU AWAKE TO NATIONAL CANNED FOODS WEEK OPPORTUNITIES?

Forthcoming Canned Foods Week Is to Be Celebrated Everywhere in the United States March 1-8, and Holds Forth Great Possibilities for Everyone Participating.

Banquets, canned foods luncheons, get together meetings of all kinds, special canned foods window trims, novel ideas for national and local advertising, and an unprecedented distribution of window streamers, mark final preparations for National Canned Foods Week, March 1-8.

Effort is now being specially directed towards Canned Foods Week luncheons by such organizations as the Rotary, Kiwanis, Lions, Optimist and other luncheon clubs.

Already 1,356 letters have been sent to Rotary Clubs throughout the United States, suggesting that they put on special luncheons during Canned Foods Week. The replies have been beyond all expectations.

Up to date about one hundred and twenty-five luncheons have been arranged for that week from the Rotary Clubs alone, and there have been many requests for speakers. Each day brings letters announcing additional luncheons. Chairman Royal F. Clark is scheduled to deliver an address at the Canned Foods week luncheon of the Chicago Rotary Club.

The National Canned Foods Week Committee has arranged a selected canned foods menu for these luncheons. There is indicated the number of cans of each commodity which will be required to serve one hundred persons. There is also included with the menu copies of addresses that might be delivered on that occasion, and likewise copy of statistics of the canning industry. This literature may be had on application to the National Canned Foods Week Committee.

All Parts of the United States to Be Reached—There will be wide use of the radio during Canned Foods Week. Availing themselves of this up-to-the-minute method of communication, speakers will reach vast audiences in all parts of the country. The talks will be strictly non-commercial in character, with the result that the facilities of the principal stations are being made available for addresses upon the excellence, wholesomeness and convenience of canned foods.

To date prospective radio speakers have advised the National Canned Foods Week Committee that there will be addresses made from New York, Philadelphia, Chicago, Minneapolis, McKeesport, Pennsylvania, and Morgantown, W. Va. One of the speakers heard from will speak in four different cities. Another will make seven talks, one each evening, from the broadcasting station in his home city.

The National Canned Foods Week Committee urges local committees to consider the advisability of securing a place on the program for a speaker in cities where there are broadcasting stations. This should be done as soon as possible, inasmuch as radio programs are made up considerably in advance. When an engagement to speak has been secured, it will be appreciated if the Washington office be notified as the committee has prepared tentative speeches, which it will be glad to forward upon request.

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 **Quality.**

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water-front enable us to give the **Service** required.

Our connection with closing machine manufacturers enables us to gives the latest, speediest and best closing machine **Equipment.**

Can you see any reason for not letting us take care of your requirements in the manner you desire?

Put Your Troubles Up To Us
Inquiries appreciated

Meeting of The Beet Section

Hotel Statler, Buffalo, Tuesday, January 25th, 1924

[COMPLETING THE SESSIONS OF THE BUFFALO CONVENTION]

DR. T. O. GOERES, Chairman.

THE CHAIRMAN—It is only a year ago that this Section was organized. Less than a dozen companies were represented at the organization at Atlantic City. I am very much pleased to see this representation increased to such a magnificent number. It surely gives the organizers the satisfaction that their efforts have not been in vain. It gives us the further satisfaction that our fellow-beat packers agree with us that this organization is really a necessity. It gives us still further satisfaction and proof that this organization has already borne fruit.

It is only in recent years that the beet packers have been recognized as packers at all. It used to be, "Oh, we pack a few beets as a side line." Pack them any old way—yes, and sell them any old way, and the jobber surely did make "side lines" of us.

At our organization meeting we agreed to take a few subjects at a time, master them, and then take up others. The real problem that confronted us was that of standardization of grades. A committee has this matter in hand, and we will hear from them later.

I have various matters in mind that we should and must deal with sooner or later:

First—To promote intelligent labeling. As soon as we get our grades standardized and adopted by the U. S. Department of Agriculture, we ought to follow our products with labels that will tell the consumer definitely what is inside of the can. If they buy 10 over beets they should know it. If the housewife wants to serve a little luncheon and wants to use a certain sized beet, the label should inform her what can to buy. You know the whole story. You agree with me that the consumer is entitled to this information, so why not give it to him? It may make a little inconvenience in the label department, but it surely will render real service, and that is what all of us want these days—service—intelligent service.

I would recommend, if you fell that it is the proper time, that a committee be appointed to formulate some plan of intelligent labeling and report at an adjourned meeting of this convention or at the next annual convention. It would be well for this committee to confer with similar committees from other Sections.

Second—Are canned beets a food or merely a relish? Have we as beet packers ever done anything to advertise the value of beets as a food? I am convinced that the consumption of beets is on the increase. I am further convinced that if the packers and the consumers knew their real food value and the different ways in which they may be served, the consumption would be doubled. I don't recommend an expensive campaign, but I do think that our produce is entitled to more publicity than it has been getting.

I would suggest that a committee be appointed to get up a small pamphlet giving the important food value of beets and containing a liberal supply of recipes.

I would like to hear some of the other packers express themselves on intelligent labeling. Table beets take in four or five sizes, and table beets sell from 20 to 35 cents a can, and the baby beets take up the other sizes.

MR. KARCH—With regard to labeling, it seems to me that at the present time the labeling of beets is in about the same situation as the labeling of peas. We use a select label, extra select and tiny beet label. We have only the three labels and five or six or seven different combinations. It would be a very simple matter for the packer to put the count on the label. It means a little extra expense, of course, in having these different counts, but they can be imprinted at a very nominal cost and in that way we can clear the situation.

MR. MINTON—I am from the Pacific Northwest, Oregon and Washington. We have just had our Northwest Canners' Association meeting ,at which we adopted the grades and names for our beets. We have taken practically the same count that you have. We start with the 35s and over, which we call the Midget, 25s the Tiny, 15s the Baby and 10s the Ruby. Seven we just designate as Whole Beets. With this on the label it will make it very easy for the housewife to tell what is in the can. We have graded not only vegetables, but fruits to a standard grade, so that when the housewife buys our cans she knows what she is going it get.

CHAIRMAN GOERES—Is that all you have on your label, "Baby Beets", You have not the number of beets in the can?

MR. MINTON—No, and I concede that may be an advantage.

CHAIRMAN GOERES—There is one objection to that—you would have to educate your consumers as to what you mean by Baby, Ruby, etc., whereas if you put a definite number it would be a little simpler. Don't you think so?

MR. MINTON—Yes, I think it would.

MR. DELAHOY—We label our beets differently. We have a special label for every grade of beet, but we do not show the number of beets on the label. I feel that we should do that. We have been marking on the end of the can 80 or 50 or 60, exactly what was in the can, but I agree with you that the label should carry the count.

CHAIRMAN GOERES—We do not realize how our products spread. Some of these gentlemen's beets may go in the same territory where ours and yours go, and you see how confusing it is. What we want to do is to get the consumer in as good humor as possible, and please him and let him have what he wants.

MR. KARCH—To bring the thing to a head, I move that the chair be instructed to appoint a committee of three to draw up a definite labeling plan and report at the next annual meeting.

Which motion was duly seconded and carried unanimously.

CHAIRMAN GOERES—The next recommendation was to ascertain the food value of beets. I have personally taken up this matter with our university at Madison, but I could not get just what I was looking for. It was a little too complicated.

We had a committee appointed last year to take up the standardization of grades, and we will listen to the report of this committee, which consisted of Mr. Greb and Mr. Garrahan.

REPORT OF STANDARDIZATION COMMITTEE

Your committee appointed to work out a standardization plan in the packing of beets has the following to report:

After a thorough consideration and a discussion lasting two hours, it was decided upon motion of Mr. Lon Sears and seconded by Mr. Gerrahan to adopt the standard as used by the Wisconsin packers during the season of 1922, as listed below:

Cut Beets:

All beets over 2¾ inches in diameter cut to uniform size.

Sliced Beets:

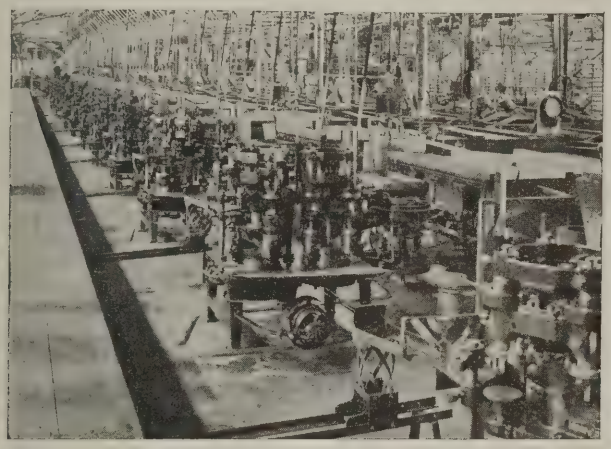
Beets 2 inches to 2¾ inches in diameter sliced ¼ to 5/16 inches thick.

hole or No Count:

A can full of beets of 2 inches to 2¾ inches in diameter.

No. 2 Tins	No. 3 Tins	No. 10 Tins
7—over 1-13/16 in.	15—over 1-13/16 in.	30—over 2 in.
10—over 1⅝ in.	20—over 1⅝ in.	50—over 1-13/16 in.
15—over 1-7/16 in.	30—over 1-7/16 in.	70—over 1⅝ in.
25—over 1¼ in.	40—over 1¼ in.	100—over 1-7/16 in.
35—over 1⅛ in.	60—over 1⅛ in.	130—over 1¼ in.
50—over 1 in.	90—over 1 in.	200—over 1⅛ in.
10—over 2 in.		300—over 1 in.

The above sizes are for beets after being peeled. For beets that are graded before peeling an allowance of ⅛ to 3/16 inch should be made. The method of peeling must also be taken into consideration.



It was also decided, upon motion of Mr. Greb, seconded by Mr. Sears, to circulate this report to all packers of beets who are members of the National Canners' Association, and as many of the non-members as it was possible to reach.

By MR. A. WETTENGEL,
Chairman of Committee.

MR. HOLT—I have one question to ask, whether it would not simplify matters very much to grade by per pound instead of by can.

MR. GREB—We thought that we would not have so many figures to keep in our head. We have seven different sizes, and they make 20 different counts from the seven sizes using the

different sizes of containers. We have some Wisconsin packers now who are labeling their beets according to this count.

MR. C. H. SEARS—Is it not true that the trade demands, in buying beets, a certain count per can, depending on the size of the can?

CHAIRMAN GOERES—That was the object of this grading and establishing the size of the screens for the information of the beet packers. We have the sizes now and everybody could adopt them. I remember at a meeting two years ago in Milwaukee I had circulars from several packers and 50 sizes of beets. Now we have brought that down to seven.

MR. HOLT—Take your first grade No. 2 cans, 50 and over. The No. 2 can practically holds a pound of beets. It would seem to me that by weight you would only have seven counts in place of 21.

MR. GREB—I might state that it would not be necessary to make the count, but if you filled your can full you would know that you had the count in every can.

CHAIRMAN GOERES—There is the point, also, that we have not a standard grader. We want to establish our grades and then some manufacturer will get up a standard grader.

MR. GARRAHAN—If you look at these jars we have here, if you fill them to the shoulder you will get the count the circular calls for.

CHAIRMAN GOERES—Is Dr. Blanck in the room? Dr. Blanck is from the U. S. Department of Agriculture, and he will doubtless give us some pointers, and we can then go on with his.

DR. BLANCK—I notice from the record of your meeting last year and from the discussion so far this morning on the standardization of beets that you are interested in the question of beet sizes, in the numerical count of these various sizes of beets, in certain sizes of cans, and that you are also interested in the so-called styles in which beets are packed.

The question, or, rather, the subject, assigned to me, "What the U. S. Department of Agriculture will do with the Standards as Recommended," might better be changed to "What the Department Can Do, etc." The definitions and standards which the Department of Agriculture adopts for use in the enforcement of the Federal Food and Drugs Act are definitions and standards that are formulated and adopted and recommended by what is known as the Joint Committee on Definitions and Standards. This Joint Committee is composed of nine men, three representing the Department of Agriculture, three the Association of American Dairy Food and Drug Officials, and three representing the Association of Agricultural Chemists. After they have considered a schedule embracing definitions and standards for food products, they recommend to the Department of Agriculture their adoption. These standards are then promulgated by the Secretary of Agriculture in the form of food inspection decisions, and then become the basis for determining action under the Federal law as to whether the product is misbranded within the meaning of that law. These definitions and standards under the Federal law have no legal standing. They are not provided for in the law itself, but they are simply formulated and promulgated for the guidance of officials in the proper interpretation of the law. In any case involving a violation of these definitions and standards it is absolutely necessary for the Department to establish the validity and accuracy of these definitions and standards in any particular contested case.

In the formulation of definitions and standards for canned beets, canned beets are, of course, in the first place, a canned vegetable. There is a definition which the Department of Agriculture adopted for canned vegetables which was recommended by the National Canners' Association quite a number of years ago, at the time when the canned pea grades or qualities were under consideration, so that I would suggest, in the first place, in your preparation of your beet standards for submission, that you give a definition as to what canned beets are, irrespective of quality or size, just a general definition of what canned beets are.

I am also impressed with what looks to me like a slight confusion which is developing in the canned fruit and vegetable industry, and that is a slight confusion in terms.

Now you are using the term "grade" here, and I think properly so, to differentiate size, because from my own experience in the field and among the canners the apparatus that separates any product into different sizes is called a "grader." I think you are correct in restricting the use of the term "grades" to size; yet the current practice to a certain extent has been used to apply that term "grade" to quality, as was evidenced in the standards for the various so-called grades of canned peas. I believe, however, that the Pea Section is going to get away from that by using the term "quality" to indicate the different qualities in canned peas.

The second point I want to call to your attention is: You have certain descriptions of cut beets, sliced beets, diced beets, etc. I would like to raise the question as to whether or not they do not represent different styles of packing, rather than the question of grade. I have in mind, particularly in the packing of corn, the question of whole corn or cream corn, etc.

There is another point there: In your question of size I am impressed that you are combining two things in your size statistics, you are combining the actual size of the individual beets that go into the can, and you have seven of those; you are combining the actual size of the beetes with the fill of the can, because when you state on a No. 2 can 15 over, you are specifying there not only the size, but you are specifying the actual fill of the can; at least, that is the interpretation I would place on this, and I would raise the question as to whether from the standpoint of definitions and standards it is necessary for you to specify the fill of the can, because the fill of the can is taken care of by every food law that I know of. From a labeling standpoint it is a different question, and for the information of the consumer the question of knowing the number of beets that are in any particular sized can, of any particular size, is an important question, and is certainly a desirable thing. But I am simply stating that under the general requirements of all our food laws, Federal and the various State laws, the fill of the can, the proper fill of the can, automatically takes care of itself.

I would suggest in the first place that you prepare a general definition for canned beets, describing them in simple, accurate language, just what canned beets are.

Then if you are so disposed to recognize the different qualities, such as fancy, or crushed, or standard, or so forth, because that seems to be the general tendency in fruits and vegetables, to indicate the various qualities to differentiate as well as you are able the difference between such qualities in the canned beets, if that is the practice, to distribute your canned beeets on the basis of quality differences.

Then, third, to define or describe your canned beet styles, if that is the proper designation of these differences between these beets, the whole beets and the baby beets, and so forth.

And, fourth, to define canned beet sizes, probably these seven sizes that you have indicated.

The question probably will naturally arise as to what the Department of Agriculture can do with such a definition or such a series of definitions and standards for canned beets. There has been a great deal of misunderstanding as to just how far the authority of the Department of Agriculture under the Federal Food and Drug Act can go. As far as the law itself is concerned, there is no positive requirement which sets a correct statement of the nature of the contents. We cannot require under that law that a packer of beets shall put on his can that the can is fancy quality or extra standard or what. We cannot require under the Federal law that he shall designate either the size of the beeets from a diameter standpoint, or that he has so many beets of a certain size in a particular sized can. All that the Department of Agriculture can do under the Food and Drug Act as it is now in effect is to require that the statements which appear on the label regarding the contents of that can are true and correct.

There is another size, however, to the adoption by the Federal Government of definitions and standards, and that is the educational value, the promulgation of such definitions and standards, reaching practically every person in this country. You are all familiar with the development and the increased interest that the housewife and thee consuming public are taking in a more intelligent labeling of canned foods or any other product, where they cannot actually see the product, and with the adoption by the Department of the definitions and standards recommended by you gentlemen as beet packers, recommended by you as representing the best trade practice, commercial practice in the canning of beets, recommended by you as recommending uniformity in the packing of that product, the adoption of the definitions and standards by the Federal authorities I believe will go a long way in the increased education of the consumer, and to the point that if they do not find what they want to find on the label, that they will come back and indicate to the retailer just what they wanted when they were buying, either from the standard of size or the standard of quality.

CHAIRMAN GOERES—I would like to appoint a Nominating Committee consisting of Mr. Karch, Mr. Delahoy and Mr. Sears.

Dr. Bigelow will now address us, having for his subject "Processing Beets in No. 2, 3 and 10 Tins."

(Dr. Bigelow's address may be published later.)

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

A MEMBER—I would like to ask a question, whether the soil and seed have any influence upon the color of the beets?

CHAIRMAN GOERES—There is no question about that.

DR. BIGELOW—I am sorry Mr. Woodbury is not here to discuss that question with you. This can only be controlled when we get a law that will enable us some way to handle the seed. There is a bill that has been approved by the Department of Agriculture and the National Canners' Association has been using its efforts in its behalf, and it looks to me as if we may in the future be able to control the different strains of seed, so that the person getting the seed will know what they are.

As has been said, there is a great deal of trouble that the beet packers have as to the unreliability of seed. I saw this last summer where some canners simply rejected large fields of beets because they had no use for them. We can only control that by some systematic way of handling the seed. Many seedsmen are doing all they can in the matter in growing the seed properly and not getting it too cheap.

CHAIRMAN GOERES—We will now hear from Mr. Karch, of Hartford, Wis., who will talk to us on "Experience With Beet Toppers."

EXPERIENCE WITH BEET TOPPERS

By M. Karch

AFTER having been in the beeet-canning industry for a number of years, the Hartford Canning Co. found it necessary, or, at least, very desirable, to find some other method of topping beeets. There were two principal reasons: One is the matter of expense, and, second, the difficulty of securing labor at the proper time. We found that it cost us from $4 to $8 per ton to top our beets, the largest of this expense, of course, being for topping the largest sized beets, where we had fields of that kind, costing around $4 a ton, and for the smaller beets, $8 a ton, up to $8 a ton, making an average for the year 1922 of approximately $7 per ton. When we considered that some of our neighboring canners were having the beets delivered at the factory from $8 to $12 a ton, topped and all, we found that we were having considerable trouble in competing with them.

The second reason which I have mentioned is the difficulty of obtaining labor, which was more noticeable after the 1st of September. Up to that time we always had a large number of school children to help us, but after the schools opened our troubles began, especially in the years when there has been a scarcity of labor. Several times we were not able to pull all our beets before they were frozen in solid. Last year we decided to investigate toppers, and instead of buying a topper or renting one, we built one, and I think that this is of enough interest to others so that I will explain the way we got our topper or what we did.

We purchased an ordinary two-row corn husker. Taking a strip of wrought iron about a quarter of an inch thick, and about three-quarters of an inch in width, we wound the strip of wrought iron in spiral shape around one of the rollars, first to take the leaves off, and the second reason was we felt that the beets would be pushed to the bottom much more quickly if the strip was on in spiral form. Of course, we soon found that there was where our troubles began. The spirals would work all right until a lot of beets would be brought in that had a number of stones mixed with the leaves, and it would be necessary to shut down. The capacity on the large beets when dry went up as high as 15 tons during a ten-hour day. When the beets were wet and small, and carried considerable mud, the capacity ran down to three or four tons a day, and as the capacity ran down, the grief increased. One trouble with wet beets is that they clog and stop the machine. I saw one machine working that had a stream of water playing on the roller while we were there, and it seemed to help, although it made a terrible mess around the machine. Of course, that could be improved by having a suitable flushing arrangement. At the present time we are working with another party, and we are hoping to improve our machine to the point where it will work much more efficiently, and where the expense will be much less.

I am not representing the Hansen Canning Machinery Corporation at all, but I want to state that there is a circular published by that company in which they are advertising a small beet topper, and they claim that since they are using worm gears which are run, they won't have the trouble of the gears being stripped; that trouble has been overcome. That is the representation of the manufacturer, and they claim that one machine has a capacity for 15 acres, their plan being to place the machine in the field, and one canner who used a machine similar to this last year had it placed on a low truck, and had the truck fastended to a regular wagon, the elevator from the machine extending over the wagon, and both trucks being pulled through the fields. As I understand it, the machine was on so low a truck that the people in pulling the beets did not have to raise them very far to get them into the topper. Just how successfully a scheme of this kind would work we do not know.

A MEMBER—Does it take the tops off close to the beet, or is there a part left on?

MR. KARCH—Not as close as the hand topping does. It leaves sometimes three-quarters of an inch, sometimes an inch, and when the beets are wet and muddy the tops will be still longer.

A MEMBER—What experience have you had with the topper as regards the small beets—are they crushed or damaged excessively?

MR. KARCH—No, there was very little trouble in that respect. Of course, it did damage some of the small beets, but not enough so that we would really pay any attention to it.

A MEMBER—Do you know how many tons you ran through the machine a day?

MR. KARCH—We run through as high as 20 tons a day. Of course, our beets were all very similar.

CHAIRMAN GOERES—We now come back to the standardization proposition, and I would suggest that as long as we have some difficulties that we postpone this and keep the same committee in force, and let us take this up again next year. Let us experiment further and see how our crops come out. Don't let us get discouraged. All these things take time and experience to come to a conclusion.

MR. THORNE—With regard to the 2½ cans, there is quite a large agitation to substitute 2½ instead of 3, and I would suggest that we might consider that size.

THE CHAIRMAN—The suggestion is well taken, and I think the Committee will be glad to consider that.

If there is no objection, we will have this Committee continued and give their further report at the next annual convention.

We will now listen to the Nominating Committee and elect our officers.

THE ELECTION

MR. KARCH—There are two reasons for giving the report which we are giving—one, that the present officers have done such efficient work during the past year that we as members of the Committee felt that they ought to be continued in office another year; and the second reason is, that a large part of this work has not been completed, and the present officers are better able to continue the work than new officers would be, so the Committee recommends that Dr. Goeres be again elected chairman, and Mr. Greb secretary. We would like to suggest, also, if the by-laws provide, that Mr. Wittingill be elected vice-president.

We present this report and move that the same be adopted.

(Which motion was duly seconded and carried, and the above-mentioned officers were declared elected for the ensuing year.)

(Whereupon the Beet Section adjourned.)

OFFICERS OF BROKERS' ASSOCIATION ELECTED FOR 1924

At the annual convention held in Buffalo the following officers of the National Food Brokers' Association were elected for the current year:

President—Charles P. Whiteman, Interstate Brokerage Co., Oklahoma City.

First Vice-President—Walter B. Timms, Warmington, Timms & Co., New York.

Second Vice-President—Lewis R. Donelson, Jr., Donelson & Poston, Memphis.

Third Vice-President—H. A. Fleager, Kelley-Clarke Co., Seattle.

(The office of Secretary is not elective, the present incumbent having been previously appointed for the year by the Executive Committee.)

Convention Notes.—A report of the proceedings of the Convention will be printed and mailed to the members as soon as the transcript can be furnished by the official reporter.

The attendance at the Convention broke all previous records. More than 600 brokers were registered, including the non-members. The registration of canners, machinery and supply men, wholesale grocers and others interested in the gathering brought the total Convention attendance well about 4,000. Two special trains, a total of 26 cars (the Brokers' Special Train) carried part of the crowd from Chicago, and there were special train and special car movements from many other points.

THE AMERICAN KRAUT PACKER AGAINST IMPORTATION OF EUROPEAN SAUERKRAUT.

(Translation of an article which appeared in "Die Konserven, Industrie.")

It cannot be denied that the American Food Industry in recent years has made tremendous progress. The American food products have no reason to be afraid of competition from foreign countries now, because of the stringent regulations and protection which the Pure Food Law offers them. European products are now being attacked sharply, if there seems to be any reason to suppose that they do not conform in any respect with the Pure Food Laws. This is particularly true of the American sauerkraut industry. This industry in the past had to fear especially competition of German products. However, this industry has succeeded in raising the quality of its own product so that it has been able to expand and secure practically entire domestic market.

The National Kraut Packers Association have an agreement whereby all sauerkraut is shipped in new barrels. This association has established the fact that European kraut exporters are using old lard barrels in which to ship kraut into the United States. They are advertising the fact that the kraut which is packed in old lard barrels has a disagreeable and even harmful smell, due to the rancid lard. This is dangerous to public health, as the consumer has no means of establishing whether he is buying imported or domestic sauerkraut. The National Kraut Packers Association is making a thorough investigation of the qualities of sauerkraut shipped in old lard barrels in order, if necessary to start vigorous action against inferior imported kraut.

BALTIMORE, MARYLAND

AYARS 1924 MODEL
New Perfection
PEA and BEAN FILLER

This Model Made For No. 1, 2, 3 and 10 cans.

REVOLVING HOOPER

New design, straight side, large at the bottom. The peas do not stick to one side and get cold. They are always level in the hopper at all heights and do not require any agitator.

HAS POSITIVE CAN FEED

CIRCLE SPRAY IN NECK OF HOPPER

SPLASH PLATE over cans so peas will not wash out on floor.

Brine goes in cans hot. Large heater in brine tank.

CHANGING GRADES.—Filler stops and all filled cans deliver to closing machine.—LARGE DELIVERY DISK— NO CAN NO FILL.—WILL NOT WASTE BRINE.—NO RUBBERS to catch cans after they become worn—FILLS ABSOLUTELY ACCURATE—DOES NOT CUT PEAS—BAKED BEANS—Only filler for baked beans. Has separate measure and seperate saucer. If measure fails to drop part or all the quantity of beans the can will show slack to inspector.

Ayars Machine Company SALEM NEW JERSEY

Present Status of the Spoilage Claims Matter.

What has been done---The results of recent conferences--- Allowances agreed upon for certain articles

Summary—1. Full recognition by distributors of the right of the canner to guarantee against all losses in his products and to the adjustment of the claim either by shipment to zonal warehouses for examination, so far as existing laws will permit, or by any other proof which will be satisfactory to the buyer and seller.

2. The impracticability of a definite decision on the part of the Conference Committee of the National Canners Association as to the proper percentage allowance for different products and immediate reference of this question to smaller units of the industry for investigation.

3. While in all previous conferences the National Chain Store Grocers Association has not officially participated, the unanimous approval of the present recommendations by the Conference Committee of that Association was secured. The Chain Stores Association has heretofore stood for a flat allowance of one half per cent on all products.

4. The desire of both manufacturer and distributor that present trade relations be not interruptel in any way which would injure or impair distributive arrangements or future contracts which are vital to all interests.

5. Should buyer and seller jointly agree upon a cash allowance in lieu of full guarantee the division of canned foods for the present into two classes, one carrying one-quarter of one per cent. allowance and the other one-half of one per cent.

6. Immediate efforts on the part of the National Wholesale Grocers Association, American Wholesale Grocers Association and National Chain Store Grocers Association is to co-operate in every way possible with national, state and municipal food officials to see that the present plans are fully carried out.

General Statement—The question of adjustment of spoilage claims between canner and distributor has become especially acute since the issuance of S. R. A. 381, prohibiting the return of spoiled canned foods to the manufacturer. This subject has been the sole topic of discussion with the Conference Committee of the distributors' organizations at every conference held since this regulatory announcement of the government was issued. The industry is familiar with the results of these conferences held in 1923.

On January 19th, 1924, a joint conference called by the officers of Association of State and National Dairy and Food Commissioners was held in Chicago, attended by representatives of the National and the American Wholesale Grocers Associations and a committee representing the National Canners Association. This conference adjourned without any positive action, and, meeting again during the Buffalo Convention, unanimously adopted the following resolution:

"The Conference Committee representing the National Wholesale Grocers Association, the American Wholesale Grocers Association and the Conference Committee of the National Canners Association,

"Approve as a principle the canners' warehouse plan as applied to wholesale warehouse stocks only, as far as permissible under federal, state and municipal food laws.

"Approve as a principle for the purpose of the wholesale grocer crediting the retailer for spoils which must be destroyed when and where found, that the wholesale grocer is to receive from the canner an allowance mutually agreed upon between wholesale grocer and canner at the time of purchase, or in the alternative, the adjustment of such losses to be left to the contracting parties.

"Approve Aug. 1st followiing year of purchase as the expiration of the guarantee period of sales for delivery from future pack, and the period of six months on spot sales, for both the wholesale and retail stocks."

This resolution recognizes the principle of the canners' warehouse plan, as applying to spoils in the hands of the wholesale distributors, but the exceedingly delicate and difficult problem of adjusting losses in retailers' hands was left to the contracting parties for settlement.

Fany canners express entire satisfaction with the resolution and have signed up their future contracts, carrying 100 per cent guarantee. Other canners have experienced considerable trouble and have urged upon the National Canners Association the necessity of further conference to decide on uniform recommendations which would apply throughout the country to the different commodities in case of cash allowance in lieu of general guarantee.

An informal conference was held in New York on Saturday, February 2nd, at which for the first time the Conference Committee of the National Chain Store Grocers Association were active participants. A tentative understanding was reached and the whole subject was fully discussed by the Conference Committee of the National Canners' Association at a meeting in Chicago on February 6th.

At the request of the National Chain Store Grocers Association, National Wholesale Grocers Association, and American Wholesale Grocers Association a formal conference was called in New York on Saturday, February 16th. Representatives of the three classes of distributors and the Conference Committee of the National Canners Association were present, and after a lengthy discussion the following resolutions were adopted:

"The Joint Conference Committee recommend:

"The approval and reaffirmance of the guarantee by canner of his products against swells and spoils and his right to require the return, provided return can be made under existing food laws and regulations, of same to zonal warehouse, or otherwise as may be desired, so far as swells and spoils are concerned, which develop in jobbers or in buyers stocks as accepted by the Buffalo conference.

"Recognition of the difficulty of combining with a canner's guarantee a cash allowance in lieu of full compensation for retaile rswells and a recommenda-

END STACKING MACHINE

The End Stacker shown is designed to be placed adjacent to any of our various sanitary end producing machines where it is desirable to stack ends as discharged. It is also well adapted to any work such as baking powder, lye or cleanser bottoms, or any ends having straight or curled flanges. This device is built in two sizes, and being entirely automatic, receives and places the ends in a neatly stacked form. The object of this Stacker is to eliminate hand stacking and possible damage caused by excessive handling.

Adjustment is also provided to vary the height of the intake chute so as to correspond with the discharge of the machine to which it is attached. The can ends as received are stacked automatically from the bottom. The hopper has sufficient capacity to accommodate 36'' of ends and is so constructed that they may be removed without interfering with the continuous operation of the machine. The adjustment for different diameters is very simple and can be accomplished in a few minutes. The complete apparatus requires very little floor space and is provided with grooved pulley that allows it to be operated direct from the adjoining machine

McDONALD MACHINE CO.

7600 South Racine Avenue **Chicago, Illinois.**

tion that this provision be eliminated from the guarantee provision.

"That it is the sense of the Joint Conference Committee that there is a desire on the part of the seller to fully protect the buyer against spoils loss, and that buyer does not wish any profit or loss to accrue from said cash allowance made in lieu of normal swells.

"Recognizing this principle, it is apparent that the members of the Canners Conference Committee are not in position to fairly determine the different classes in which the different products should be placed when buyer and seller desire a cash allowance in lieu of normal spoils.

"That the final decision of proper allowances be immediately referred to the sections representing peas, corn and tomatoes; the Canners League of California, the Northwest Canners Association, the Hawaiian Pineapple Canners Association, and the Association of Pacific Fisheries, for immediate investigation and conference with distributors.

"That in order trading in canned foods be not interfered with the following percentages be recommended to meet the present situation:

Class 1. Allowance one-quarter of one per cent. Commodities: Peas, corn, beans, pumpkin, squash, apple sauce, spinach, beets, succotash, tuna fish, tomatoes, red Alaska salmon, medium red salmoon, pink salmon, chum salmon, pachs.

Class 2: Allowance one-half of one per cent. All other canned fruits, fish and vegetables, excepting sauerkraut and pork and beans, which the N. C. A. is not in position to pass upon.

The above percentages are in lieu of normal swells."

The above approved by:

The National Canners Association, Royal F. Clark, president; James Moore, Acting Chairman, Conference Committee.

American Wholesale Gorcers Association, J. H. McLaurin, President; George E. Sloan, Chairman, Conference Committee.

National Wholesale Grocers Association, J. W. Herscher, President; Arthur P. Williams, Chairman, Conference Committee.

The National Chain Store Grocers Association, Charles Parr, Chairman, Conference Committee; Alfred H. Beckman, Secretary.

It will be seen from these resolutions that the agreement is tentative and that no attempt has been made by the Conference Committee to settle this question in a final way. The committee were impressed, however, with the fact that in many distributing centers future contracts were being held in abeyance, awaiting the outcome of this conference. The recommendations which were finally adopted are not satisfactory to everyone, but the present uncertainty and the consequent interference with future business was so apparent that action of some kind was absolutely necessary to prevent imperiling the entire 1924 output of canned foods. The question is held open with the hope of final settlement when the necessary data can be obtained.

The members of the Conference Committee of the National Canners Association felt that they could not fairly express the views of the canners of the different products, and the resolution recommends that so far as each product is concerned data be collected by the commodity sections of the N. C. A. or by local organizations representing particular products. Immediate action is urged in getting this data collected as quickly as possible. The information desired is a collection of detailed figures showing the actual amounts of swell and spoilage claims paid by individual canners over a period of years. As soon as this information is secured arrangements will be made for conferences between representatives of the commodities sections or local organizations with the distributors.

ARK.-MO. FUTURE TOMATOES.

Springfield, Mo., February 11, 1924.

Dear Sirs:—It is a fact beyond dispute that it will cost more money to pack tomatoes in 1924 than the cost of packing last year. This is due to the advance in prices on packers' cans, and the further fact that canners are compelled to contract for tomatoes at about $2.00 per ton over the price paid in 1923.

Although prices were not named on future tomatoes by any of the canners of our district until about thirty days ago, the sales to date are the largest we have ever known for so short a time. These orders for futures are much larger from each individual buyer than they have been at any time since the period of the great World War. Quite a few of our canners have already sold to their limit on futures and have withdrawn from the market.

We quote below opening prices on future tomatoes for our district, and are prepared to handle orders for account of old, established and absolutely reliable canners, whose packs are of a quality we do not hesitate to recommend. These quotations are subject to canners' confirmation:

48 No. 1 Standard 10-oz. Hand Packed Tomatoes, 60-62½c. dozen.

48 No. 1 Talls 15-oz. Hand Packed Tomatoes, 76-77½c. dozen.

No. 2 Standard Hand Packed Tomatoes, 90c. doz.

No. 2 Extra Standard Hand Packed Tomatoes, 95-97½c. dozen.

No. 2½ Standard Hand Packed Tomatoes, $1.20-1.25 dozen.

No. 3 Standard Hand Packed Tomatoes, 1.30 doz.

No. 3 Extra Standard Hand Packed Tomatoes, 1.37½-1.40 dozen.

6 No. 10 Standard Hand Packed Tomatoes, 4.25-4.50 dozen.

Most canners will only sell futures on pro rata delivery contract. A few canners will guarantee 75 per cent. delivery.

Jobbing grocers located in district where the car rates of freight are very advantageous on shipments from our packing district should feel perfectly safe in covering for a large part of their future tomatoes while we have offerings for the account of old, reliable and well-established canners. We earnestly solicit correspondence from jobbers in the market for future tomatoes, as there might be times when it would be possible to handle same business at slight shade in prices. As we have many canners who do not care to sell for buyers' labels, it is very necessary that we have full information if buyers desire to make purchases for shipment under private labels.

Jobbers receiving this letter can make their purchases of future tomatoes through our office with every confidence of receiving satisfactory service.

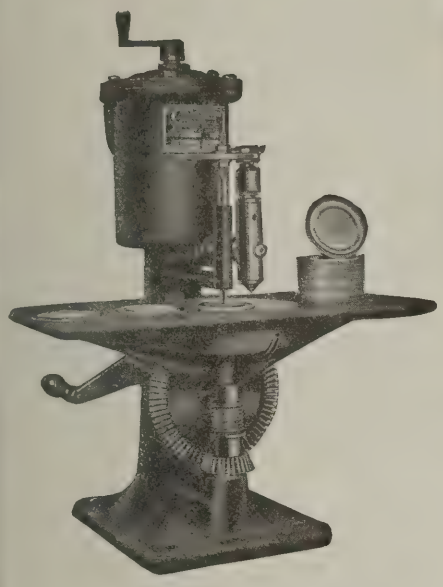
A Good Canned Foods Week Address.

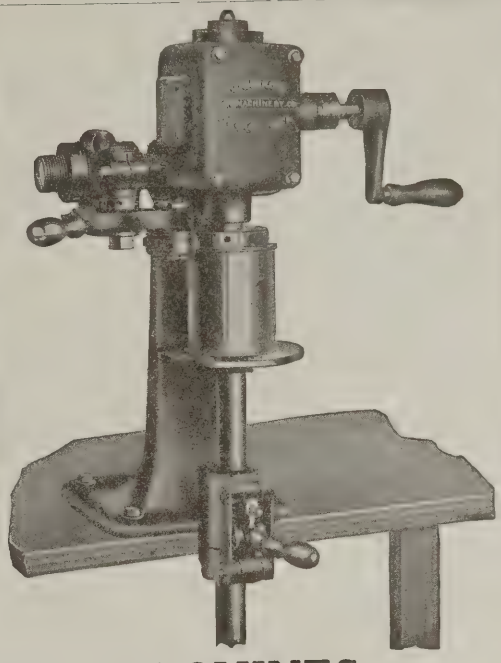
By Royal F. Clark, of Beaver Dam, Wisconsin, President of the National Canners Association, Before Buffalo Rotary Club, Thursday Noon, January 24.

A working Model For Speakers during Canned Foods Week.

I WANT to say at the outset that I am very grateful for this opportunity of telling you something of the work of the National Canners Association. which organization is devoted to the ideal and has within the spirit that is the very life of Rotary. Although I am an infant Rotarian, I appreciate and feel the thrill of Rotary, and the great principle that is its guiding star, service above self.



The purpose of the National Canners Association is industrial co-operation for service to the canner in promoting the welfare of the industry and increasing the consumption of canned foods, and service to the public in providing wholesome canned foods of great variety at all seasons of the year.

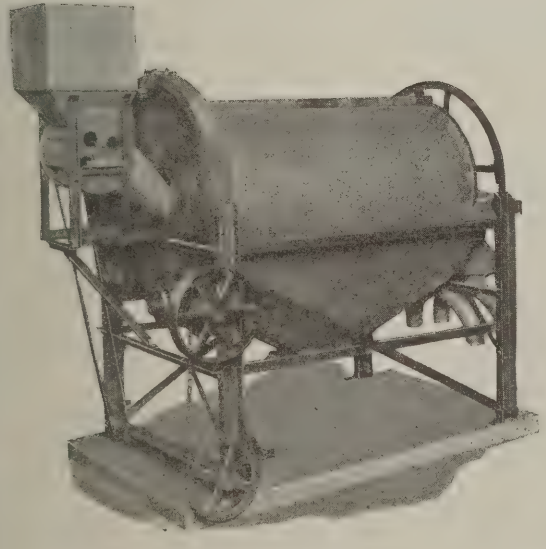


That you may know the magnitude of the canning industry, I desire to give you a few brief facts. There are approximately today 4,500 canneries in operation in this country and Hawaii, with an annual output of over 200,000,000 cases, and well over one billion dollars in value. Over two hundred different products are now preserved in either tin or glass containers. The commodities are divided into vegetables, fruits, fish, milk, soups and meat, thus conserving all of the necessities of life with the exception of grains. Of course, I am speaking in reference to those commodities preserved in hermetically sealed cans, and am not attempting to mention the many products, such as cereals, coffee, and so on, which are distributed in tin containers, but not hermetically sealed.

The canning industry has grown by leaps and bounds during the last decade, and particularly has production and consumption increased since the World War. While it is necessary to overcome certain prejudices in the marketing of any product, the growth of this industry has in the past been particularly menaced by a deep-seated prejudice in the minds of many consumers about the use of canned foods. This prejudice has been largely overcome by broadcasting the truth in reference to the preparation and canning of food products, in which the National Canners Association has played an important part. The greatest activity of the Association in production of canned commodities was during and since the war. Canned foods became an important factor in the feeding of the armies and caused a temporary shortage throughout the country. At about this time very rigid standards of sanitation were adopted by the National Canners Association, which have been followed since. The by-laws of the Association require a member to maintain sanitary canneries and operate them under sanitary conditions. The Association has adopted a code for the guidance of its members and the operation of their canneries, and provides such inspection as it deems practical for the purpose of keeping in touch with existing conditions and advising members of the problems of sanitation. In addition to that, many states have gotten into line by the promulgation and enforcement of rules of sanitation, assuring the consumer first of all that the commodity preserved is clean, fresh and wholesome.

One of the greatest menaces to the canning industry is the publication and circulation of false reports relative to food poisoning. Special research work on food poisoning was begun in 1917, in co-operation with Harvard University, and has been carried on since that time in co-operation with the United States Public Health Service and three other colleges, namely, Stanford, California and Chicago. These investigations have been of great value, not only to the industry, but to the medical profession and business at large. Results of the research work of the Association are published in bulletin form and in the scientific press.

The research work of the National Canners Association has likewise been in progress for many years. The laboratories in Washington at the headquarters of the Association occupy three floors, and ten trained scientists are now employed there. The chemical, bacteriological and physiological research includes studies of canned foods and canning methods. The research work covers problems in every stage, from the container to the finished product. Much attention has been devoted to the study of the principle of sterilization of canned foods, with a view of putting this important study of the canning business on a sound practical basis. The same principle which guided our ancestors in the conservation of food commodities by canning is likewise applied to commercial canning, that of heat sterilization. However, to make doubly sure that the product is safe and will not spoil, it has been necessary, through scientific research work, to establish the thermal death point of bacteria, so as to make spoilage a very small factor in the industry. One of the special problems included in the research work is a study of the tin plate used in the manufacture of cans, including the effect of the acidity of food on sterilization, the effect of the consistency of food on sterilization, and the vitamin content in canned foods. New problems arise almost daily, and but a short time ago certain scientific men in the colleges and high schools of this country made the announcement that vitamins in certain com modities were completely destroyed under the process of commercial canning. Immediately our trained men at our laboratories, in conjunction with laboratories in colleges, with whom we had made arrangements to study specific questions, commenced an investigation, which is now being carried on. This investigation has progressed to the point where it can be safely said that the statements thus made are not in accord with the facts. For instance, it has been proven that more vitamins are destroyed by the boiling of cabbage in the open kettle than by the process employed in canning. I have no fear in making the statement that when these investigations are com-



CAMERON HAND OPERATED MACHINES

This double-seamer attaches bottoms to can bodies and covers to filled cans. The Compound Applier spreads the rubber cement on the edges of the can ends. These machines are suitable for cans from 2" to 6" in diameter and up to 9" high.

CAMERON CAN MACHINERY CO. 240 N. Ashland St., Chicago, U. S. A. 23

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

pleted we will be able to prove, not only through our own men, but through scientific research in the colleges of this country, that the vitamin content is conserved rather than destroyed in canning.

It has taken a great deal of work on the part of the Association, and many thousands of dollars have been expended, to prove that canned foods are safer than fresh foods sold on the market—that they are pure, wholesome and nutritious. To the users it is a reality; the future work is one of advertising and ultimate conversion of the non-user.

The National Canners Association has a Bureau of Information, keeping the members advised of laws and rules relating to the industry, pending legislation, and of other matters which are of interest to canners, excepting only those relating to question of price. It promptly investigates complaints where canned foods are concerned, and up to date has investigated 1,130 charges. The results of these investigations show that a large majority are without foundation, false, and are due to misrepresentation, deliberate extortion or blackmail. It has a raw product research bureau, which is carried on in co-operation with various agricultural organizations and institutions designed to improve varieties, use of improved seed, control of plant disease and blight. It has a foreign trade committee which works in co-operation with the Department of Commerce to increase and develop foreign trade in canned foods. It has prepared and distributed to the canners systems for the classification of canners' accounts which have been found to meet practical requiremets. It issues bulletins from time to time and other publications relative to the research work of t Association, and in addition popular and trade bull tins are issued. It publishes annually statistics the pack of certain canned foods and an annual dire tory.

In order to secure more intelligent and unifor labeling the Association is continually working on de nitions for various grades of foods, but here is whe the Association has a vast amount of work ahead. T Food and Drugs Act proved to be a blessing in di guise to the canner, but this act has many limitation Neither the Bureau of Chemistry nor the Departme of Agriculture has the power under the existing la to make definitions covering quality of goods, dealin only with what is known as "misbranding." In oth words, the Government is clothed with authority seize foods misbranded, but has no authority to defi quality of the goods labeled. The past system of l beling, to a great extent, led to confusion in the pu chase of canned foods from the retailer, and one crit cism directed against the industry has been again the system of labeling. An industry which has esta lished and proven to the world the purity and whol someness of canned foods must let the label reflect t true contents of the can, and at this convention it expected that the details of standardization of labelin will be agreed upon and followed in further distribu tion of food products, so that housewives will be ab to make intelligent purchases.

Other great factors in the increase in consumptio of canned foods have been convience, economy, an

HAMACHEK IDEAL VINERS

Tests and comparison of packs have clearly demonstrated the importance of more efficient hulling. Experienced packers have replaced over One Hundred viners of other manufacture with Hamachek Ideals.

Hamachek Ideals are the best constructed viners on the market. They are built of durable material, require less power, their up-keep is small, and they have the greatest capacity.

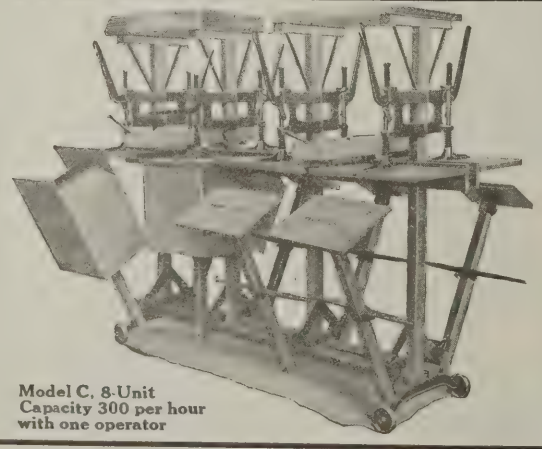
necessity. Convenience, because the contents are cooked and ready to serve. Economy, because we eliminate the waste and are able through large production and distribution to bring to the consumer the same quantity of food at less cost than the same commodity fresh. Necessity, on account of the large increase in population in cities—apartment dwellers—shortage of domestic help. And as the bulk of our population moves towards centers will the necessity increase, and thus we are engaged in conservation, the watchword of the American public.

You have heard much about conservation of forests, water power, and resources, but very little about the conservation of food.

From time immemorial civilization has rested upon three factors, namely, food, shelter, and clothing. wars have involved one or more of these factors. Progress depends upon the abundance in reserve, but the greatest of all is food, and yet America, styled as the land of plenty, has paid very little attention to the food requirements of the future. While the farmers, due to increased efficiency of methods and larger acreage, have temporarily choked their market and strangled their own prosperity, they have awakened to the fact that their attention must be turned to quality, and quality decreases production in any line of endeavor. Twenty per cent. of the total farmers have left their farms during the last decade, and the same rate may continue during the next, but economists tell us that cities can absorb the influx without disturbing industrial conditions.

We have but one crop of agricultural lands, and by far the greater part suitable for profitable quality products is now being farmed. What of the increase in population, sure to bring us soon to 150,000,000 in the United States? In this the canner visualizes his future, but already has realized that his success lies only in quality production and intelligent distribution, and in this we are not different from any other industry—quality must be the slogan.



I am optimistic as to business conditions during 1924, if quality is put into industry, although manufacturers must avoid overproduction. Wages will not go down and may advance, likewise costs of manufactured articles will advance, and wage earners must reconcile themselves to increased prices. I have greater faith in America today than ever before—faith in her ability to grapple and solve industrial and social problems upon the new plans of activity and life. Professional politicians, having in mind only their own advancement, out of touch with the real problems of industry, and leading the voters into chaos by their radical schemes, must be turned out of office and sent back to their homes to work like the rest of us. Capital and labor, hand in hand, must work out their own destiny by favoring laws that will protect all of the people and make real the possibilities that are so easily within their reach.

While we must give attention to foreign trade—cultivate it, reach out for it—we must remember foreign trade amounts to but ten per cent., and our real business is home business. Home business can be increased only by working in harmony, not by strife and deception. Protection and full guarantee of the rights of all the people must be proclaimed and maintained.

The Markets

BALTIMORE, FEBRUARY 25, 1924

WEEKLY REVIEW

Rumor Trying to Induce Lower Prices—Reason Dictates Just the Reverse—Buying Steady and Continuous With Advance—Futures Selling Quite Well in All Lines—Some Sellers Impatient—All Indications Point to Growing Strength of Market.

STALKING THE MARKET—Most too much is being made of the apparent belief that prices will soon be lower on all canned foods—spots and futures. It is said that the buyers are taking but few goods because they feel that lower prices will soon be seen. A timorous seller of futures who is induced to lower his prices, even very slightly, causes all buyers of futures to hesitate and to wait, because there may be a lowering of prices, it is said. Market influences need not be reasonable; sometimes the most flagrantly foolish things are causes for declines or advances in market prices, and the present condition would seem to present one such situation. What real cause can be pointed out for a lowering of prices on spot canned foods, particularly? Why should they be lower? The consumption of canned foods is upon a really immense scale today. The people know the goods and are eating them to their heart's content. The retailers are not complaining of the way the goods are moving off their shelves; and even if this were not true, there is rapidly approaching an occasion which will quicken that consumption—Canned Foods Week, with its nation-wide appeal to all consumers to speed up on canned foods consumption. And if you are of the doubting kind, and discount the effect of Canned Foods Week in toto—though one must be a crass fool to make such a discount—then just consider that the heaviest consuming months of the whole year are just beginning. From now on is the time when the country eats most canned foods, a fact proven by long experience. What, then, is going to bring about this reduction in prices? Is it because the stocks of goods are top-heavy? You laugh at such an inquiry, and you do well to laugh.

It is just an empty, unreasoning rumor that tries to disconcert the holders, and to help the buyers get a little better bargain in supplying the urgent wants they feel. There is not a foot of ground upon which such a rumor can rest for even a moment. It is not our mission, nor have we any desire to "bull" the canned foods market, but any other view of the present situation than a bullish one is the direct opposite of the real condition. That is so far as spots are concerned. Of course, anything might happen as regards futures. There have always been a lot of canners who can grow record-breaking crops, bring all the product to waiting factories and produce it for far less than any definit figures could show—and such canners, working while the snow is on the ground (in their imagination), and months before even the seed could be sown, often rush out to sell futures before the whole bottom drops out of prices! There is no way to account for them. But sensible canners are not proceeding upon any such theory. And if there are any buyers who would like to contract for their supply of goods with the other class, they deserve what they may get.

TOMATOES—There is no gainsaying the fact that spot tomatoes are being traded in upon a most conservative basis. The buyers are taking what goods they need for present wants, and by their apparently disinterested action are succeeding in holding down the spot market. We do not know but what it is a good thing that they are holding down the market. If it ran away now, as it might very readily do, there would be such a deluge of futures sold and so many men get into the canning game that next fall there might be "the devil to pay." Big operators in the market say: "The market on spot tomatoes, while not active, is holding firm and stocks are being gradually reduced." All over the country, it would seem, the jobbers prefer dealing among themselves for what tomatoes they need, but this cannot go on forever. These buyers know that practically all canned tomatoes are in the Tri-State territory, and what are there are held by men who do not have to sacrifice. We know of only one block of tomatoes held on speculation; the rest are held by canners who know the value of the goods and intend to hold until they get it. And they will get it. It's a long time between now and tomato-canning time, and the people will continue to eat canned tomatoes.

Futures seem to be worrying some canners. The bargain hunters in future canned tomatoes should seek that certain trade which must sell a large proportion of their expected pack at this time if they expect to be financed during the season. It is out of this class that the mistaken idea was spread that the canners are forced to sell futures to finance themselves. Just the reverse is the truth—the canners that are "financed" have their futures sold for them to cover loans on seed, cans, cases and such supplies as these loans are made, and hence there are often forced sales at below market quotations. If the jobbers will clear this class of future sellers out of the market, all the industry will rise up and bless them. And they are usually pretty good buys. Because the canners have an additional compelling force behind them to see to delivery, and that if they do not deliver that they pay the additional price—it's always an additional price—on the quantity of goods by which they fall short. These fiscal agents take no chance of a pack of goods put up by a financed canner remaining unsold. The market just now, in tomatoes, is suffering from these, so-to-call-them, forced sales, but the drive will soon be over and the market for futures will then improve most likely. The future market in this section is quoted a little lower this week—No. 1s, 57½c; No. 2s, 87½c; No. 3s, $1.27½c, and No. 10s, $4. These prices are for standard quality. Extra standard ranges from 2½c to 10c, as to size, above these figures. The canner who is not forced to sell may be wise to stay out of the market for the present.

CORN—From all sections come reports that spot canned corn is cleaning up rapidly. The market in the West has been very strong on corn for some time. The East is beginning to follow suit. Corn at low prices is now looked at twice before buying, and, of course, there is a reason. The better grades of corn are firm and held with confidence. There are no changes to report in prices this week, but the feeling is growing stronger with each day.

Future corn is variously reported. Some say that it is not selling as freely as it should be; others that now the swell claim matter has been satisfactorily settled, the buyers are coming in for their requirements. It has long been known that large orders for known quality corn have been placed, without haggling on prices. A report from Iowa shows how futures have been selling there, when one firm has to buy out other well-known canneries to get production to meet demand. They are booking orders here for standard "crushed" corn at 90c, standard shoepeg at $1.15, extra standard shoepeg at $1.25, and fancy shoepeg at $1.35. This latter might easily be on a par with fancy Golden Bantam, in the opinion of many.

PEAS—Latest indications are that the canners believe that it would be wise to sell no more futures, but to hold what prospects they may have for the open market, as promising almost certain better prices as spots. We have always believed that not to exceed 60 per cent of any pack should ever be sold as futures. Peas have often exceeded that mark, but now the canners seem to be coming around to that opinion, if they have not already passed that figure. It means, however, a strengthening in the future prices and that any orders now accepted will have to carry better prices. Both spot and future pea prices are largely nominal today.

OTHER ITEMS—Stringless beans are bought, as futures, with confidence, and business has been fairly good in them. Most canners in this section have sold as many ahead as they care to, and have advanced their prices to check demand. But it does not seem to stop business. Demand for spot goods of all kinds has been continuous, though not in large blocks. But the visible supplies are being steadily eaten away, and holders are asking premiums for what goods they have. No item in the list shows any alteration in prices this week, but it will not surprise anyone to see higher prices from now on.

NEW YORK MARKET

Steady Buying Movement—Tomato Buying Quiet—The A. & P. Offers Prizes—Local Trade Will Heartily Support Canned Foods Week—Future Peas Wanted—Future Corn Is Quiet—Fruits Show Strength—Asparagus in Good Demand—Notes.

New York, February 21, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

STEADY Buying Movement—There has been no developments of a sensational character in the New York market during the week, but a healthy buying movement is in progress, with the price undertone steadily strengthening. Local distributors are not carrying large stocks, and buyers are in the market right along for replacement goods. Chain stores are featuring canned foods in all of their advertising, and are quoting some very low retail prices on the various grades offered.

Tomato Buying Quiet—Demand for tomatoes has been quiet during the week, with no quotable change in the price basis. Buyers aree fairly well covered on their spot requirements, and do not intend to be stampeded into any heavy buying movement which might have the effect of shooting prices upward. In some quarters it is reported that distributors are showing more interest in futures than in spots.

Wheeler Bureau Moves—The Wheeler Service Bureau has moved into larger and more commodious quarters in the same building at Chambers street and Broadway. The Bureau has made substantial progress during the year, and is now an extremely important feature of the canned foods trade, from the standpoint of both distributors and packers. "Singin' Ed" Greenwood and Mr. Lind, of Minnesota, are doing field work for the Bureau at the present time, with F. C. Wheeler in charge of the office force at headquarters.

Five Thousand Dollars in Prizes—The Great Atlantic and Pacific Tea Co., leading chain store organization, has aroused widespread interest in New York City by offering $5,000 in prides for the best suggestions as to how it may improve its service to consumers.

Canned Foods Week—With the swells dispute settled, for the current year at least, jobbers' support in the Canned Foods Week campaign is assured, and the local trade is making ambitious plans for the conduct of the campaign March 1-8. Retailers are being lined up for their co-operation in the movement, and jobbers are planning to placard all of their delivery wagons and trucks with Canned Foods Week signs and streamers. It is expected that the chain stores will feature canned foods in their advertising during the week.

Future Peas Wanted—In the face of a steady demand for future Wisconsin peas, more packers are withdrawing daily, and it looks as though many buyers who normally get their season's supply from Wisconsin will have to seek elsewhere for a good part of their stocks this year. Canners are not turning down business because the assortments ordered do not suit them, as was the case a month or so ago, but are refusing to take the orders ffered because they have sold up to the limit of their expected pack. This situation has naturally made for a stronger market for peas of Michigan, Illinois and Ohio packing, as well as Eastern packs.

Southern Peas—Maryland and Delaware pea canners who have named future prices on peas have booked a substantial amount of business, and the market outlook is strong. The Southern packers are in a fortunate position, in that they will be able to be delivering peas just at the time the Wisconsin packers start canning operations. Being thus able to put their goods on a probably bare market, they will be able to command better prices than they otherwise would.

Future Corn—Maryland corn canners are not believed to be doing much in the way of future business on standard corn. With the market on spot corn hovering between 92½ and 95c, factory, there is little incentive for buyers to commit themselves to futures on the same price basis. Reports from Western points state that canners are quoting spots at 95c to $1.00, mostly the latter price. It would seem, however, that if this is the case the Southern packers would be getting more mid-Western business than they are now receiving.

Fruits Are Strong—While demand for fruits has continued rather routine during the week, the market is showing increasing strength. This firmness reflects to a great extent distributors' confidence in the statistical position of the market, borne out by the reports of light holdings in California. Many of the trade believe that the start of the 1924 fruit canning season in California will witness bare floors in canners' warehouses, and quite possibly bare floors in many jobbers' warehouses in the fruit sections.

Future Fruits—California canners are not rushing in with their prices on 1924 fruits, as there are several factors which they must first take into consideration. Cans and other raw materials have increased in price. The sugar market is giving chief concern just now, however. Higher sugar prices will, of course, mean higher fruit prices. At present writing the outlook for future California fruits is that prices will be as high as they were at the 1923 opening on most items, and that on some lines they will be higher.

More "Grass" Business—There has been an increased demand for future California asparagus during the past week, and sales by the better-known canners have been heavy. The opening of the Corporation has been shaded by about 10c in at least one instance, but the value of the advertised brand of the Corporation offsets this lower price in the minds of many of the buyers.

Salmon Dull—Little buying interest has been shown in salmon during the week, and the anticipated Lenten buying spurt has so far failed to materialize. The Coast situation is strong, however, depsite current quiet in this market.

Personal Trade Notes—Georgia Pimento Canneries, Inc., of Atlanta, has appointed Arnold & Montgomery, Inc., its New York sales representatives.

J. W. Herscher, of Charleston, W. Va., president of the National Wholesale Grocers' Association, was in the market last week.

Charles E. Farriss, well-known broker in fancy Japanese crabmeat, is on a visit to the Pacific Coast.

C. A. Lumb, of the J. K. Armsby Co., is on his annual visit to the Pacific Coast this month.

J. E. Barr, of the Minnesota Crosby Corn Exchange, of Minneapolis, is visiting in the local market.

D. H. Stevenson, of the Torsch-Summers Co., of Baltimore, was in the market during the week.

Among the up-State canners in the market this week was S. C. Osborn, of the Livingston County Canning Co., of Hemlock, N. Y.

C. W. Baxter, president of the Portland Packing Co., of Portland, Me., was visiting along Hudson street this week.

CHICAGO MARKET

Good Shipping Weather Hard to Hold—Demand for All Goods Very Active—The West to Celebrate Canned Foods Week—Inquiry for Fruits Improving—Pineapple Demand Improving—Corn Cleaning Up—Tomatoes Must Come From Tri-States—Marshall Canning Co. the Leading Producer.

By "Wrangler,"
Special Correspondent "The Canning Trade."

THE Weather and Shipping—We have had shipping weather for canned foods now for nearly ten days. Snow and ice have laid on the ground, but the weather has not been severe enough to prevent shipments. At this writing it is snowing, and the snow appears to be getting heavy and deep. It may turn cold after the snow is over and again prevent shipments and cause an accumulation of orders.

Canned Foods Week—The demand for canned foods of all descriptions is very active, and the activity is attributable to the buying by retail grocers in order to replenish their stocks and complete their assortment, preparatory to the trade which they anticipate from Canned Foods Week, March 1st to 8th.

This sales event will be very generally observed all throughout the Central West, and an enormous quantity of canned foods will be disposed of by the retail grocers, for which they are now making preparation by purchases.

Fruits—The inquiry for California canned fruits is improving and orders are going to the Coast, so I understand, for numerous carload lots. The buying is especially in extra standard and fancy yellow cling peaches and apricots.

There is a reaction noticeable in canned pineapple. The market has been slow for some time past, but is now very much improved. The holders who have had stocks and who were anxious to dispose of them seem to have had a change of heart, and are now not offering. Several kinds have increased enormously in price on account of the demand, especially crushed pineapple in No. 2 and in gallon cans, sliced grades, which have been dragging a little bit, but have now apparently revived and are selling well.

The depression in pineapple, it appears, did not come from speculation, as but very few speculators were permitted to buy any of the pack of 1923; but on a sag of the market a number of small holders who needed money were inclined to close out at opening prices so that they could use the money to better advantage in goods that were more active.

It is claimed by well-posted packers and operators in pineapple that the price for 1924 will be a little higher than the price for 1923. The extensive plantings which have been made in the islands will not come into bearing until 1925. The price of cans and the price of sugar will be considerably higher, and this will bring about the necessity for the slightly higher price of canned Hawaiian pineapple for the pack of 1924.

Corn—Canned corn is cleaning up well. It is now difficult to find any standard corn at the former market price anywhere in the Central West.

Tomatoes—This market is relying entirely on Maryland and Delaware for its supply of canned tomatoes, as the resources of the Central West are entirely exhausted, except as to a few lots which are being held for speculative purposes.

Peas—Occasionally a spot lot of canned peas is found in less than carload quantities, and the brokers do not find much trouble in placing them with the jobbers, who are all looking for certain grades and qualities, and who are all short on canned peas.

I have seen several letters recently from Wisconsin pea canners advising their brokers to the effect that they have sold up on futures and do not want any further orders for future peas of the 1924 pack. It is remarkably early for activity of this kind, and it shows the trend of things.

The Marshall Canning Co., Marshaltown, Iowa, has just bought the Kelley Canning Co., of Waverly, Iowa, and will operate the plant for the 1924 season and afterward. This establishes the capacity of the Marshall Canning Co., so it is said as the largest producer of canned corn in the world. The company will operate for 1924 the following plants:

Marshall Canning Co., Marshaltown, Iowa, output	120,000 cases
Marshall Canning Co., Hampton, Iowa, output	120 000 cases
Marshall Canning Co., Roland, Iowa, output	60,000 cases
Marshall Canning Co., Ackley, Iowa	40,000 cases
Marshall Canning Co., Waverly, Iowa	120,000 cases
Total	460,000 cases

The Marshall Canning Co. was compelled to add the Kelley Canning Co. at Waverly, Iowa, to their producing facilities for the reason that their sales of canned corn for future or 192 pack have gone beyond the capacity of their other four canneries. This is remarkable for so early in the season. The Marshall Canning Co. specializes on extra standard and fancy Evergreen canned corn and on fancy Country Gentleman canned corn, and on account of careful attention to quality has built up a patronage that is taxing their capacity. They state that their sales of the 1924 pack are now encroaching upon the probable output of the newly purchased factory, and may necessitate the purchase of other plants.

ST. LOUIS MARKET

Market Quiet This Week—Future Buying Slows Down in Hope of Lower Prices—Buying Spots Only for Immediate Wants—Weakness in Tomato Futures Halts Business—Peas Continue to Gain Strength—Corn Is Firm for Fancy, Standards Steady—Fruits Quiet.

St. Louis, February 21, 1924.

By "Missourian,"
Special Correspondent "The Canning Trade."

MARKET Quiet—The movement in canned foods has been rather quiet the past week. This applied not only to spot goods, but to futures as well. The distributors have been placing some small business for immediate shipment and larger contracts for future deliveries. There has been a healthy demand for spot shipments as to vegetables, while futures have sold in quantities that have exceeded expectations. Buying of vegetables of 1924 pack is inclined to go slow, as jobbers want lower prices than those now quoted. Spot goods of all kinds have been slow sellers, as they are now taken principally for present requirements only.

Tomatoes—A falling off in the consuming demand for tomatoes is hardly explanable. There has been a fair business until only a short time ago, and some interest was shown in futures. Then, too, the fact that concessions have been made on some future business has had a weakening effect. Less future buying has been reported since. The general range of the market is unchangeable. Southern tomatoes are selling in a limited way for factory shipment, and then mostly in 2s, with very few gallons. Traders are drawing upon private and public warehouses for most of their goods for current use and are not so interested in future shipments. There is some buying in the country, but it is restricted and is confined largely to small orders. Canners have no cheap ideas, because they feel able to clear their stocks without trouble before the season closes. Some future business is being booked, but sellers and buyers are still too far apart in their views to get together. Some operators maintain that jobbing stocks are heavier than canners have realized, and that while country points have sold out, the big pack, the output of 1923, has not yet reached the consumers.

Peas—Brokers say that it is getting more difficult all the time to get through future orders of peas at going prices in all districts. Canners are fortified by the favorable results of the past three or four years, leading at present to a well-sold-up condition on 1923 lines and further strengthened by the higher packing costs of 1924. No canner has cheap ideas, as he is able to get his prices and sell his anticipated pack. Canners in the South think that their goods will be needed for early distribution to fill the positive gap in stocks of 1923 lines. Spot peas are firm in all grades, and are sparingly offered mostly in small lots and wholly in a resold way. Restrictions as to assortments and suggested average prices along with advances on straight standards have not limited the business in future peas. There is a free movement among packers who have heretofore limited their

offerings, the business being divided between Wisconsin, New York and other Mid-Western packing points. Southern peas futures are not so attractive, although there has been a fair volume of business concluded. Wisconsin packers have been withdrawing from the market. Those who are still taking business in futures are demanding assortments of 75 per cent fancy and extra standard grades. Spot peas are difficult to find.

Corn—Spot corn is firm in fancy lines, which are scarce and steady in standards. There is not a large supply of the latter on the spot, and while it can be had at a price, holders insist on full quotations. Moderate interest is shown in new packs.

Miscellaneous—Asparagus has been disappointing, although the total of the business booked to date is not by any means small. Orders have been for limited quantities for the most part. Future string beans, spinach of the spring pack and succotash are in fair demand, but the volume is not excessive.

Fruits—The fruit line is inactive. There is no speculative demand for any item for even a normally good seller like pineapple is not moving in its usual volume. The pineapple market is rather depressed by reports of low-priced offers of good brands, which often are not vailable at figures mentioned. California fruits have had a better demand during the past few weeks. Although the markets have not bought heavily, the aggregate business from the entire country reaches sizable proportions. It is probable that 1923 pack fruits will be cleaned up before the new pack is ready, and it may be expected that 1924 prices may be somewhat higher. Peaches, pears and cherries are featured in the trading, with a limited demand in evidence for fruit salad. Berries are less active. Tentative openings on Oregon and Washington fruits, and berries have attracted little interest.

CALIFORNIA MARKET

Crops Are Doing Better—The Growing Season Now On—More Rain Badly Needed—Canned Foods Week Bigger Than Last Year—Some of the Work Being Done—Business on Spots Active—Good Business in Asparagus—Notes.

San Francisco, February 21, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

THE Crops—The rains which visited Northern and Central California early in February did an immense amount of good and enabled farmers to plant crops which should have been in the ground much earlier. They were followed by warm weather. The growing season may now be said to be definitely under way. However, much more rain is needed if crops are to be anywhere near normal, and conditions in the southern part of the State have reached a critical stage. Even when the rainfall is normal there is none too much water in California, owing to the rapid development of irrigation facilities and the wide use of wells, and when the precipitation is so far below the average as this year, the situation cannot be anything but alarming, particularly following a series of dry years. The rainfall for the season at Los Angeles has been but 1.81 inches, as compared with a normal to date of 9.66 inches; that at Fresno is but 1.81, as compared with a normal to date of 5.89 inches, and San Luis Obispo has had but 3.77 inches, instead of an expected average of 12.30 inches. Further north a better showing has been made. San Francisco having received 9.34 inches, as against a normal of 14.55, while Sacramento has had 6.43, as compared with a normal of 12.37 inches. Growers and canners are taking comfort in the fact that the late rains are the ones which do the most good, but the fact remains that the situation is about the most serious of its kind ever faced in California. The late rains saved the spinach situation and enabled growers to plant peas, but came too late to permit the planting of the acreage that had been contemplated.

Canned Foods Week—Much interest is being taken in Canned Foods Week on the part of canners, jobbers and retailers, and there is every indication that this will attract much more attention than was the case last year.

Newspaper stories are commencing to make their appearance and retail grocers are being lined up for window displays, which promise to be out of the ordinary. In directing attention to this special event, Joseph Durney, of the Griffith-Durney Co., San Francisco, recently said:

"In 1922 canners, jobbers and retailers started a campaign called Canned Foods Week, setting aside one week in the early spring to feature canned foods of all kinds. During said week wholesale and retail grocers devoted practically their entire time toward interesting and explaining to consumers the wonderful merits of canned foods.

"In endeavoring to educate consumers we explained to them that practically everything put up in cans is better than the fresh article ordinarily bought in the market. For instance. canned salmon: When one is able to buy fresh salmon in the market, one never knows how long it has been caught or how long it has been in the refrigerator, and the longer it has been on ice, the less flavor it has; whereas, salmon is canned within a few hours after it is caught.

"It requires very little demonstration to prove to any consumer how much better canned asparagus is than that in what we call the fresh state. If there is one vegetable that is more delicate than another and which loses flavor and becomes more or less fibrous after it is cut, it is asparagus. It is true that there is nothing more delicious than fresh asparagus if it is grown in one's garden and cooked within a few hours after it is cut; but most asparagus bought in the fresh state has been cut from thirty-six hours to two days, is ungraded both as to color and size, some has even gone to flower, and is in no way comparable to the canned article which is canned within a few hours after it is cut.

"Then, consider pineapple. The bulk of the fresh pineapple brought to the United States is grown either in the Hawaiian Islands or in the West Indies. It is picked and shipped green, and ripens after it is picked; whereas, canned pineapple is packed from fruit that ripens on the plant and is canned within a few hours after it is harvested. For one's own satisfaction he has only to buy a fresh pineapple in the market and compare it with that in cans.

"On canned fruits the foregoing remarks equally apply; in fact, more so for the reason that canners for years have been buying the choicest part of the crop; whereas, the bulk of the fruit marketed fresh is what we call second grade. I have only mentioned a few of the interesting points connected with the work we do during Canned Foods Week to show the consumer how much better and really cheaper the canned article is when the labor, time and expense of cooking in the household are taken into consideration. In other words, Canned Foods Week is now recognized as a week devoted to educating the consumer, and I am pleased to say we have met with marked success."

The Market—Spot business is quite active on almost all lines of California canned products, with the export demand quite an interesting factor once more. In California canned fruits Bartlett pears are being given considerable attention, and some holders are asking higher prices. Apricots and cling peaches are also moving well, and some grades are in very light supply. Most orders are for assortments and immediate shipment is specified, indicating that stocks are low.

Asparagus—An excellent volume of business has been booked on asparagus at the tentative prices named recently by several of the large packers, and it is anticipated that much of the pack will be disposed of by the time that canning is commenced in March. It is expected that the formal opening prices will be the same, or practically so, as the tentative prices announced.

Tomatoes—While formal opening prices have not been named on future California tomatoes, some business has been done locally on the basis of $1.10 to $1.15 for No. 2½ standards. Spot stocks are moving off in good shape, with many packers out of the running.

Coast Notes—The California Packing Corporation, San Francisco, is having plans prepared for a very large plant at Sacramento, Cal., which will represent an investment of about $1,000,000.

The Tulare Co-operative Creamery Association and Riverdale Co-operative Creamery Association plans the erection of a $75,000 powdered milk plant at Tulare, Cal.

The H. J. Heinz Co. is preparing to enter the Greater San Francisco field, according to reports. It owns property at Oakland and has asked permission to close two streets to enable the erection of a building to cover two city blocks.

E. G. McDougall, of Libby, McNeill & Libby, Chicago, is visiting the San Francisco offices of this concern.

The Van Camp Sea Food Co., Inc., experienced a very satisfactory year in 1923, according to the annual report, a net profit of $302,675 having been made. Sales for the year totaled $2,061,322.35.

MAINE MARKET

Business Shows More Activity—Promise of Early Spring—All Spot Goods Very Scarce—The Future Corn Prices—Not Offering No. 10 Corn Freely as Futures—Stringless Bean Future Prices—Canners Are Buying New Machinery.

Portland, Me., February 22, 1924.

By "Maine,"
Special Correspondent "The Canning Trade."

WHILEbusiness has been very quiet all through the winter, the past fortnight has seen rather more activity and a more optimistic feeling pervades the local market. The weather so far has been mild and open, so that rural dealers can now be assured of an early spring season, and are buying more freely. (It is possible that this confidence in the weather may be misplaced, as this week has brought a touch of real winter storm, almost the first we have had.)

Spot Maine canned foods are surprisingly scarce. Beans were cleaned up, of course, at the close of the canning season, with short deliveries on about ninety per cent of the contracts. Blueberries are also gone, with the call still coming in for this line of goods. On Maine apples I doubt if there are half a dozen cars left in first hands, and those are not being pressed on the market now, as May and June are sure to bring a demand at good prices. There are several lots of Maine corn held, owned in small blocks, and comparatively little of real fancy grade. On the other hand, the quality runs very good, much better than ordinary standard, and it is steadily going into consumption—like all spot stocks today it is moving often in smaller lots, but is steadily disappearing. The strictly fancy is also finding a good market.

Future corn has now been offered by all Maine canners, and the prices heard at the Convention are still in force. Crosby corn is $1.45 and Golden Bantam $1.70. There are still some who think these figures too low and who are asking $1.50 and $1.75, and, as usual, there are one or two "weak sisters" who will grant concessions if pressed.

Although the demand for No. 10 corn increases each year, there are fewer Maine canners offering that size today. When offered the prices are $7.25 and $8.50 for the two sizes.

Stringless beans have been put on the market simultaneously with corn, at prices of $1.30 and $6.00 for 2s and 10s. There is a steadily growing demand for these beans and a consequent increasing interest on the part of the canner.

Much new machinery has been purchased this season with a view to maintaining the present high standard of quality while increasing the volume.

TOMATO IMPROVEVENT WORK TO BE ENLARGED.

Money Appropriated and Other States Induced to Cooperate—The Allotments.

ACCORDING to notice duly given, the Executive Committee of the Tri-State Packers' Association met at Wilmington, Hotel Dupont, on the evening of February 14th.

The principal business at this meeting was to devise, if possible, means of increasing the membership. The plan of assessing each member so much per case on his pack, which had been suggested at a former meeting, was gone into rather thoroughly. This plan contemplated raising such a sum of money as would enable the Association to employ what might be called a field man, or full-time secretary, to traverse territory, gather statistics of the crops, conditions of the crops· packs, stocks on hand, etc., and to send them in to the Secretary, who should compile them and send the result to the members.

This was considered in its various details until quite late at night, but no definite conclusion was arrived at. The meeting, therefore, was adjourne until 10 o'clock the next morning. When the matt was taken up again and the Secretary submitted son figures bearing upon the proposition, but no defini conclusion was reached by 11 o'clock, at which tim the Association had an engagement with the Agricu tural Committee and the heads of extension work i the three States of Delaware, Maryland and New Je sey.

Upon opening the session with the Agricultur Committee and others, Dr. Symons presented a stat ment showing what had been done in Maryland durin the past year with the funds put in his hands by th Association to be expended for better tomato growin

Dr. McCue, of the Delaware Extension Servic stated that excellent results had been obtained in De aware by following largely the same lines of procedur as had been followed in Maryland, but that they di not go into it to the same extent as did Maryland.

A representative of the New Jersey Extensio Service was also present, and stated that, while th plans adopted in Maryland had not been generally pu into practice in New Jersey, yet he was satisfied tha in some localities where it had been used great benef had been derived.

The question then came up as to how much mone the Association would be able to appropriate toward better tomato growing, as well as to the eradicatio of diseases in corn. After considerable discussion, i was thought that if the Association could be assure of $1,000 at least from the can companies who had s generously aided in this movement last year that th Association would pledge itself for $1,400, making th sum of $2,400 to be applied to agricultural objects i the Three States.

This sum of $2,400 was apportioned as follows:

For corn growing and eradication of diseases	$5·000.0
For better tomato growing in New Jersey	200.0
For better tomato growing in Delaware	500.0
For better tomato growing in Maryland	1,200.0
Total	$2,400.0

Dr. Symons introduced Mr. Metzger, a corn spe cialist, who detailed the method of securing the bes seed corn and keeping up the strain. It seemed to b conclusive that corn could be saved in different locali ties and kept pure provided sufficient care was em ployed. This seemed to have been the practice of som canners for a number of years who had maintaine the quality of their seed stock, but of course great car must be taken both in selecting and propagating th stock.

The matter of saving tomato seed was also brought up and generally discussed, and it was agreed that canners who were properly equipped with pulp ing machines, and would take the proper care in se lecting their tomatoes in the field· bringing them t their factory and extracting the seeds and drying them properly, could very easily secure seed of a high grade and suitable for their uses. It was thought that this could be made a paying proposition to the canners who might devote sufficient care to the saving of the seed.

It was thought wise to increase the membership of the Agricultural Committee, and accordingly Messrs. C. L. Reckord, Greenwood, Del., and Orrell S. Saulsbury, Ridgely, Md., were added, making the committee consist of F. A. Torsch, Lucius Hires, Harry L. Cannon, C. L. Reckord and Orrell S. Saulsbury.

A NEW EDITION

OF

"A COMPLETE COURSE IN CANNING"

SOON TO BE READY

Thoroughly and completely revised, in every detail, by the highest authority and leading food technologist of the world.

OFFERED

¶ As the finest, most comprehensive and most authorative treatise ever published on the canning, preserving and pickling of all food products, and for the making of condiments, preserves, frust juices and specialties.

READY ABOUT MAY 1st, 1924.

¶ A HISTORY—There were about a dozen books on canning on the market at the time "A Complete Course In Canning" was first published, 1902; and several have attempted the market since; but they all failed for the same reason: they were either a mere collection of formulae (the times and ingredients) or were too highly technical and scientific for ordinary use. As its name implies, A Complete Course In Canning was written to cover the entire subject, from the building of the cannery, the contracting of the crops, and their procedure through the factory to the warehouse, and in such language as the variest beginner could understand. It was based upon the best proceedure of that day, and in the four revisions since, has been kept well up to the most modern methods. This latest revision brings it not only fully abreast of the times, but rather in advance of them. There is no man in the business but what will find this work a welcome visitor to his desk-—a real necessity.

¶ We published some of those other works for the authors and we have known them all, and we unhesitatingly recommend this new edition of "A Complete Course In Canning" as the finest thing ever offered the industry.

IN THE MEANTIME.

¶ The old edition of the book has been exhausted, except for one case of books which was caught in a flood, caused by a bursting City main. We have rebound these books, the only damage to them being a slightly wrinkled appearance to some pages. We are offering these at $4. per copy, instead of $5. the price of "A Complete Course In Canning".

The price of the new edition will probably
be $10. though this is not definite, as yet.

SMILE AWHILE

PAGE THE OLD SCRATCH

The daughter of a certain strict principled old deacon ha attended a dance the previous night, much against her father wishes. When she appeared for breakfast the next morning h greeted her with the words:

"Good morning, daughter of the devil."

To which the maiden respectfully replied:

"Good morning....father."—Jack o' Lantern.

HIS HORRIBLE MOTIVE

The respectable tramp knocked gently upon the door.

"Madam," he began, touching his cap to the lady who ap peared, "a while back you gave me three doughnuts. Would yo mind adding another one, to make four?"

The lady was all gracious.

"Gladly," she answered, smiling, as she wrapped one up an handed it to the tramp. "So you like my doughnuts, do you?"

"No, Mum," replied the truthful tramp, "but me and som friends down in the holler wants to have a game of quoits."— Voo Doo.

She—Mandy, did you sweep under this carpet?

Mandy—Yes, Missus Jones, I sweeps everything under tha 'ere carpet.—Punch Bowl.

A negro had heard his parson tell the story of Daniel i the lions' den. He doubted the story very much, however, so h decided to see the parson about it.

"Pahson," he questioned, "am it true dat Daniel was throw in de lions' den and dey didn't eat him up?"

"Yas, suh, Brudder Smiff," answered the parson, "dat ar de fack."

"Den dey must have been circus lions."

"No, suh; de Bible say just de kontrary."

"It do?"

"Yas, suh, it do. Don't it say dat it happened 600 B. C.?"

"Yeah it do say dat."

"Well, don't B. C. mean befo' circuses?"—Black and Blu Jay.

She (back from a honeymoon from Switzerland)—Don't yo remember that wonderful gorge in the Alps, dear?

He—Sure do, it was the squarest meal I ever had.—Roya Gaboon.

CONSERVATION IN EXTREMIS

The dying man shook his head tearfully and maintained "I won't take it, no, Ikey, it tastes awful."

"But, mine dear fren," groaned Ikey, "you can't die an leave all these expensive medicines wasted."—Bison.

WOMANKIND IN THE MAKING

"How long before she'll make her appearance?"

"She's upstairs making it now."—Royal Gaboon.

IN DEEP

Smith—It must take a lot of money to follow the radi craze. I hear you have a new outfit—what kind of receivers ar you going to have?

Smythe—I don't know. The court hasn't appointed them yet.—American Legion.

OUGHT TO BE SATISFIED

Wife—It says here in the paper that there was a marriec couple in Omaha who didn't speak for ten years and then got a divorce?

Husband—Why?

ANOTHER ALIBI

"What's the idea of driving all over the place?" demanded the traffic cop, sarcastically. "I suppose the road looks that way to you."

"Not a-tall, officer," replied the slightly befuddled motorist "I'm awright. Road's awright. But thish is new car and just got christened. Champagne went to th' steerin' gear."—Ameri can Legion.

THE CANNING TRADE

THE JOURNAL of the CANNING and ALLIED INDUSTRIES

Established 1878

PUBLISHED EVERY MONDAY BY

THE TRADE COMPANY

ARTHUR I. JUDGE . . . . . Manager and Editor

107 South Frederick St.

Baltimore, Md.

Telephone Plaza 2698

Packers are invited and requested to use the columns of THE CANNING TRADE for inquiries and discussions among themselves on all matters pertaining to their business.

Business communications from all sections are desired, but anonymous letters will be ignored. ARTHUR I. JUDGE, *Editor.*

THE CANNING TRADE is the *only* paper published exclusively in the interest of the *Canned Food Packers* of the United States and Canada. Now in its 47th year.

TERMS OF SUBSCRIPTION.

Payable in advance, on receipt of bill. Sample copy free.

Entered at Postoffice Baltimore, Md., as second-class mail matter.

Vol. 47 BALTIMORE, MARCH 3, 1924 No. 28

EDITORIALS

THE WEEK "THEY" CELEBRATE---Under the Food and Drugs Act we are not allowed to label this paragraph "we," as it would seem it should be named, because, if you will recall, there is a provision therein which says that the article must be named after the predominant ingredient, or in other words after the one which is most in evidence. Now Canned Foods Week is essentially and wholly a time when canned foods (the products of the canners) are called particularly to the attention of the consumers, and this ought to make it "our week." But as a matter of fact other than canners are putting the week on, and the canners are taking only a very minor part in it, so it is "the week They celebrate."

Frank H. Langsenkamp, the well-known maker of the equally well known tomato handling machinery, copper kettles, etc., has jumped into the week with characteristic energy, and is making Indianapolis, his home town, know that canned foods are good to eat. He has the newspapers of that town up on their toes, talking canned foods, boosting them, and he even went so far as to introduce William Clendenin, the apostle of sauerkraut, the man who invented the kraut cocktail, and who, himself, admits he wrote "Paradise Regained" (the discovery of sauerkraut) to come down to Indianapolis and to tak to the various clubs. Between them they are going to address every club and civic body in their section during this week, and will hand out samples of tomato paste in cans to all the members. The brokers, wholesale grocers and jobbers are joining him heartily in the good work, and we trust at least some canners are running along with him.

Out in Cincinnati that aggressive and progressive bunch, the United States Printing and Lithographing Company, who supply such a large proportion of the labels for canned foods, have issued one of the most attractive circular announcements of the week that we have yet seen. It is done in colors, and announces radio talks by the Cincinnati Canned Foods Week Committee: H. J. Esterman, chairman; J. C. Kerr, Ben Schmidt, Aug. Janszen, George Bauer, G. T. Mougey, John Flach, G. V. Lewis, Henry Helmers, E. F. Klum, Nic Janson and W. H. Gersie. The circular shows Station W-S-A-I (309 meters) broadcasting talks beginning March 1st, showing likenesses of the speakers (the committee), and then, on the other end, the country receiving the messages, headed by the likenesses of J. A. Anderson, F. E. Gorrell and Royal F. Clark, each one topping a can of foods and backed up by the listening multitude. It is a catchy, attractive, expensive announcement, and a credit to Cincinnati and its committee.

Everywhere, in all sections, the peons of praise of canned foods as the best foods fed the people are welling up to the skies, and it is hoped the voices of the canners are heard in chorus with those of their friends. Canned foods will receive this week such an impetus as they never received before. May the shade of Sam Haserot, who first dreamed of such a reality, feel comforted that his dream has come true.

HOW WE HAVE GROWN—"There are 4,200 canneries in Indiana; Pannsylvania has but 3,000; Illinois 3,600 and Ohio 2,900 * * Indiana canneries produce six cans of tomato products every working second of every working day in the year, and leads other states of the Union in the tomato canning industry." Mr. Clendenin is speaking before the Service Club at a luncheon in the Hotel Lincoln, according to the Indianapolis Star of February 26. We think we know Mr. Clendenin most too well to believe that he made any such wild statements, and we attribute them to the enthusiasm of the newspaper.

And yet President Royal F. Clarke, in addressing the Rotarians at Buffalo, said htere are 6,500 canners in the business. Just what Secretary Gorrell and his staff of secretaries can be doing when they publish, in their annual directory, hardy 3,000 names of canners, may become a matter for investigation, now over-popular in Washington, unless, of course, there are only just that many firms or individuals in the business. There has been a lot of wild-eyed talk among the machinery and supplies men, coming from inexperienced parties, seeking to make them believe there are

anywhere from 5,000 to 10,000 canners in the business, and this is most unfortunate. The Directory published by the National Canners' Association, to which we have referred, is the best and most authentic list of men in this business published and more nearly correct than any other possible list. For the sake of sanity and fairness to all concerned let this be understood once for all: there are just about three thousand canned foods packers in the business, operating approximately 4,000 factories, and if we add all items, including fish, fruits, vegetables, meats, milk and all the specialties, the total number may run to 3,300 canners, producing approximately five billion cans of foods yearly. The world wants to know more about the industry of canning, but it expects its members to agree on what they say. Let's get together.

For the supply man and the man seeking business from the canners, if he has a list showing 5,000 names, as some boast, the best thing he can do is to throw it into the fire and get an N. C. A. Directory; and when the advertising solicitor offers you any such immense field you will be safe in judging his game by the manner of its presentation. There is need of this statement, it would seem.

The speed in which we live—The Buffalo Convention passed into history six weeks ago!

Man needs little here below—and the less he has the more he bellows.

THE DEMANDS OF THE CANNERS---Time was when the Association canner paid his dues of $5 or $10 per year, religiously packed a clean collar into his little hand grip and traveled to the Convention; there sat and listened to all that was said, resoluted with his fellow-canners, that the record might read "unanimously passed,' and returned home and forgot all about whatever may have been done at the meeting. To have his name mentioned as a member of some committee was about the height of his ambition, and the extent of his work, on behalf of said Association. They met, passed resolutions, appointed committees—and the committees carried out the resolutions—and buried them as a rule.

Does this satisfy the canner of the present day? Not as a rule. They are now beginning to ask, what do we get for our dues? Why pay even $5 per year for the privilege of attending an annual Convention, when we can attend it without paying? And the inquiries are coming because a great many canners' Associations are now giving their members "something' for their money. Their secretaries have become fiscal or business agents, serving all members faithfully and well, and making of the Association, as it should be, a real business assistant to every member. As more of them take on this new life, more Associations want and demand this style of service, and it cannot be denied them. Not if it is expected to keep the Associations alive. The Association can be a mighty power of help and the day has come when it must be that. Those that cannot answer up to that requirement will do well to look to their status. There are still some canner organizations which should take this advice seriously, and others that are beginning to adopt it. Men are spending dollars more freely than they ever did before, but they are, also, beginning to ask more pointedly, "What do we get for this dollar?" And this demand is but reasonable.

VIRGINIA CANNERS TO MEET MARCH 5th.

The Virginia Canners Association will assem at the Chamber of Commerce, Roanoke, Va., Wednesday, March 5th. Speaking of this, the lo paper says:

The next annual meeting of the Canners' Assoc tion of Virginia will be held here on March 5, it w decided at a meeting of the board of directors of t Association, which also discussed plans for the co vention. The board met at the Chamber of Commer in the assembly room of which the annual conventi will be held. One of the features of the conventi from an entertainment standpoint, will be the lunche served the visitors by the Virginia Can Company he and the Bedford Can Company. The full program w be announced later.

The meetings of the canners have always been inspiration to them, it was said. The meeting th year is expected to be one full of interest and t canners are expected to derive much benefit from it. large number of canners throughout the State a expected to attend.

These present at the meeting this morning we A. L. Murray, W. G. Spigle, C. G. Reaburn, J. V Gillaspie, B. F. Moonmaw, B. R. Ikenberry and L. Johnson.

The Virginia Canners' Association was organiz fourteen years ago at Fincastle, with a small numb of charter members. It now takes in practically canners of the State. Roanoke, being centrally locate is a logical place for the convention, it was said.

Officers are: B. R. Ikenberry, Daleville, presider and W. J. Spigle, secretary-treasurer.

Tomatoes are the principle products of the canner Around 800,000 cases were canned last season, it w stated. The chief markets are in the South and in th coal fields of this State and West Virginia.

H. W. FREEMAN BRANCHES OUT.

After having been in active charge of the Fo Sales Corporation, the well known brokerage house Newark, N. J., for some years, H. W. Freeman h decided to launch out on his own hook. He h named his company Harry W. Freeman & Co., and h offices at 671 Broad St, Newark, N. J. He says th they will conduct a strictly brokerage business. H large circle of friends will be glad to know of thi and, we predict, continue to entrust him with the business.

MORRAL BROS. ISSUE A CATALOG.

The Moral line of canning machinery is quite we known among all canners, especially corn canners, an there are a great many who use it. The Morral sing and double corn husker are particularly well known an used extensively. The Morral corn cutters have bee on the market for even longer, and have advocates wh praise them far above all others. These machines, t gether with the various styles of cutters—for recuttin double cutting, and the Morral labeler are all shown i a new and handsome catalogue just recently gotten ou In this they call attention to their ability to cut Golde Bantam corn with ease and precision and this will lea many to investigate this line further, and to their ad vantage. These machines win on their own merit They are made in the town of the same name—Morra Ohio.

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER:

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 **Quality.**

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water-front enable us to give the **Service** required.

Our connection with closing machine manufacturers enables us to furnish the latest, speediest and best closing machine **Equipment.**

Can you see any reason for not letting us take care of your requirements in the manner you desire?

BROOKLYN, N. Y.

Tin Plate and Its Defects from the Canners' Point of View.

By Dr. W. E. Elwell, Chairman Tin Plate Committee.

IT IS an interesting fact that the manufacturers of food products preserved in containers made of tin plate are indebted to the enterprise and public spirit of a manufacturer of men's clothing for a comprehensive and authoritative review of the tin-plate industry.

As a result of prizes offered by Messrs. Hart, Schaffner & Marx, of Chicago, in an effort to draw the attention of the American youth to the study of economic and commercial subjects, numerous essays were submitted, among them one by D. E. Dunbar on "The Tin-Plate Industry," which was awarded first prize by a committee of university professors. I have taken much information from this essay as an introduction to what I have to offer you on the subject of tin plate as we canners use it when made into tin cans for the preservation of food products. Let me make acknowledgement now to the author of this book for his valuable contribution to a subject, always of importance to canners, which has become of increasing importance as our industry has developed, and includes the ever-increasing variety of food products that we offer to the consuming public. This book was published in 1915 by the Houghton Mifflin Co., and is entitled: "The Tin-Plate Industry—A Comparative Study of Its Growth in the United States and in Wales."

In a parliamentary document published in 1912, which consists of a report on the conditions of employment in the manufacture of tin plate by E. L. Collins, her majesty's medical inspector of factories, it is stated that the tinning of iron plate had its origin in Bohemia; that in 1620 the Duke of Saxony obtained the secrets of the industry and introduced the manufacture of tin plate into Saxony. It was from this country that England learned the process in 1665, but no commercial application of this knowledge was made until 1720, "when the manufacture of tin plate began its career in Wales." The history of the industry in Wales is an exceedingly interesting story, altogether too long to even review in a brief address of this kind. It is sufficient for our purpose to say that by 1890 the Welch manufacturers of tin plate had secured an almost world-wide distribution of their product, which had been adapted to a constantly increasing variety of domestic and commercial utensils and had a virtual monopoly of the business.

In these days of rapid and enormous production it is interesting to know how the product of 1890 differed from that of the present time. The Iron Age of January, 1892, gives the following description of manual tinning as practiced at that time:

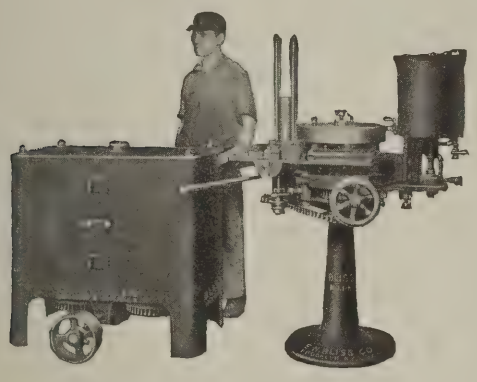
> "After the second bath in sulphuric acid, the sheets remain in water until ready for tinning, which is done by the 'five-pot' process. The top of a long brick dresser contains five oblong troughs heated by fires from below. Standing in front of the dresser are three men, known as the tinman, the washman and the riser. They are flanked by several girls, called 'branners' and 'cleaners.' Into the first pot containing boiling palm oil the tinman places the sheets one by one and leaves them immersed from **one to five minutes** in order to clean the surface of all impurities and make it absorbent. Next, he transfers the sheets to the second pot which holds the molten tin. They remain immersed from **two to five minutes**, and their surface forms an amalgam with the tin. In the third pot the tin is purer and hotter, and here the sheets receive a second coating. The washman removes the sheets from the third pot, and, placing them on the hearth in the middle of the dresser, brushes them with hemp, to take off surplus tin. Then he dips them in the fourth pot, which contains the purest tin. Finally, the riser immerses the sheets in the boiling grease of the fifth pot through a pair of revolving rolls. The pressure of the rolls regulates and makes uniform the coating of tin."

It will be seen from the above that up to 1890 the bla plates were dipped in tin three times. The present practice Wales and this country in the manufacture of coke plate is pass the steel sheets quite rapidly, by means of rolls, throu the molten tin **but once.**

The McKinley Tariff Act was passed in October, 1890, b the clause relative to tin plate did not go into effect until July 1891. This provided for a duty of 2.2 cents per pound on t plate imported into the United States and was intended to pr mote the establishment of the industry in this country. Th this proved to be a timely and constructive piece of legislati is shown by the fact that the United States is now by far t largest manufacturer of tin plate in the world and has tak much of the world trade in this product from Wales.

The Welch manufacturers in anticipation of competiti under the McKinley Act began, as early as 1890, to give serio attention to improving their methods of production, largely wi a view to economy in manufacture, and are responsible for ta ing the initiative in the development of more or less automa machines for tinning purposes, but the American industry we them one better by constructing much larger machines. T Welch developed rolling machines weighing some 7 tons, b since 1895 American machines have been built weighing 14 to with rolls 28 inches in dlameter, as compared with the ea Welch rolls of 19 inches in diameter.

A review of the history of the tin-plate industry in t United States makes it clearly apparent that there has been constantly increasing demand for this product, which has be due, in no small measure, to the really remarkable increase the confidence of the public in the wholesomeness of cann foods, and the present dependence of the people, in a large pa of the civilized world, upon food products sterilized and pr served in containers made of tin plate.



There is no doubt that much credit is due the Americ steel and tin-plate manufacturers for the prompt and efficie way in which they have responded to the demand for produ tion. This has been the ever-pressing and, up to the prese time, the most serious problem with them.

It is but natural that in meeting the larger problem of pr duction, by the development of machines and changes in meth that some change in quality should result. In considering t question of present-day quality of tin plate, which has becor so serious a problem for canners, it is always important to gi first consideration to the character of such improvements have been made and full credit to those who have labored earnestly in the production end of this vast industry.

Economy has been introduced in connection with the rollir and cutting of the steel bars from which the plates are roll to meet the demand for a very wide and somewhat unnecessa variety in sizes of cans with a minimum of surface loss. Metho have been adopted for passing the plate through the tinning rol in such a way as to avoid loss of tin from its excessive accum lation upon the edges of the plate, and rolls have been made wi great care and engineering skill to permit of maintaining a tr surface under varying degrees of expansion from heat at t center and ends of the rolls. The object of this is to insure coating of tin as nearly uniform in character as possible, so th there may be no waste resulting from excessive tin at the ed of the plate caused by greater expansion at the center of t rolls and separation of the ends.

Mechanical devices of various kinds that have permitted economy in labor are in general use in tin mills, and there ar no doubt, other improvements of methods in mechanical oper tions that only those who use them can adequately describe.

ATLANTIC CAN COMPANY

BALTIMORE - - - MARYLAND

What, then, of the product as the canner finds it today made into cans which he uses as containers for the numerous food products which he endeavors to preserve for future use?

Cans cost from 4 to 22 per cent of the cost of the finished product, but in some respects are the most important article he uses. His success depends, to a very large extent, upon the stability of the container. If the container fails for any reason, there is lost with it from 78 to 96 per cent of the total cost of the product.

Practically all of the food products which the canner seeks to preserve, when once sterilized, exhausted and adequately sealed, are imperishable for many years. When spoilage occurs in goods treated in this way it is due to the defects of the container, either leaks, cracks or perforation, or discoloration from metallic salts produced from the action of the contents upon the metals from which the container is made.

Canned foods are not perishable; in fact, the object of canning is to make perishable articles imperishable. It is the container that is perishable, especially when made of defective plate.

If all containers made of tin plate reacted uniformly to the strain put upon them incident to processing and transportation, and to chemical and electric reactions set up by their contents, the problem arising as the result of spoilage would be greatly simplified. It is a well-known fact that they do not. Fortunately the majority of the cans used give reasonably satisfactory service so far as the tin plate from which they are made is concerned. If all cans were made of plate that is as defective as some that finds its way into canners' cans, there would be no canning industry.

Our problem, then, is to ascertain in what respect a given sample of tin plate differs from another, and why. It is not necessary to set up the fact that tin plate as now made is of variable quality, for it is freely admitted that from 15 to 20 per cent of the plate made is of inferior quality and is classed as "seconds" or "wasters." In addition to this, there is considerable variability in gauge and ductility. Let us consider the latter qualities first.

Reasonable accuracy and uniformity of gauges for cans of different sizes can be secured by adequate methods of sorting plate. This would, no doubt, result in some surface loss because of the difficulty incident to rolling accurately to gauge and the fact that exceptionally thin plate sometimes occurs in rolling bars cut for sheets for cans of large sizes. It is thought that these thin sheets should be sorted out at the source and cut to the sizes for which their gauge is suitable before tinning. This would be a far smaller economic loss in the end than now results from making cans and covers of plate that is so thin it buckles, cracks and panels.

The open top can of today imposes narrower limits upon the platemaker and the canmaker in the matter of gauge and ductility than cans of the old cap-hole type. The acute bending of the plate in locking seams and rolling tops and bottoms demands that a reasonably soft plate be used. Brittle plate is a fertile source of cracks and leaks. This can be eliminated, first, by proper annealing and, second, by proper sorting, and to do this at the source would result in less economic loss than now results from cracked and leaky cans when filled with food many times the value of the can. These two defects are comparatively minor faults that can be eliminated promptly; in fact, just as soon as canners realize their rights as purchasers and insist upon them.

Right here the canner can perform a real service for his friends and canmakers, who, we are convinced, have many serious problems of their own, for it is only by demonstration that the purchaser insists upon certain qualities that the canmaker can persuade the tin-platemaker that his product must be adequately sorted and graded before delivery.

We now come to the more serious and difficult problem of securing plate that is uniformly and completely coated with tin of a quality best adapted to protect the steel from the action of the contents of a can of food of any kind.

It is admitted by all that coke plate, which is the plate used for making most of the cans used by canners, is never completely coated with tin. When examined with the microscope the surface shows innumerable small openings and voids which are of two kinds. First, pinholes which sometime look like small volcanoes and are caused by the escape of hydrogen gas when the tin is in a molten state. Hydrogen results from the pickling of the plate in dilute acid to remove the scales and clings to the steel surface in condensed form which expands from the heat of the molten tin. When defective steel is used, there are other small openings through the tin exposing the plate which are generally somewhat larger than the pinholes. These are due to failure of the tin to unite with the steel, either because of su face scale, pitting or other minute defects in the surface son times of a spongy or porous character. It is these small ope ings through the tin, more especially those which, for want o better term, I have referred to as microscopic waster spots, th are primarily responsible for perforation and discoloration.

First, as to discoloration, which is, perhaps, the least of t two causes of loss. Leaving out of consideration all of the tec nicalities and theories that have tended to obscure the questi the fact remains that all who have studied this problem agr that the iron in the iron sulphide comes from the steel base pla Just why the quantity of iron sulphide appears to vary in d ferent cans containing identically the same substance is a tec nical question concerning which there is some difference of opi ion. It may be stated generally, however, that where the su face of the steel is well finished and homogeneous, iron sulphi may and does eventually develop where the pinholes leave t surface uncovered and is widely distributed rather insoluble a clings to the surface. When, however, there are certain defec in the surface of the steel, which result in the formation of m croscopic waster spots, the altered, spongy or scaly conditi of the steel seems to invite union with sulphur which is prese in a considerable number of food products as a constituent protein and is liberated by the decomposition of the protein the heat necessary to sterilization. Without regard to these d tails, if the surface of the steel was uniformly and complete covered with tin, the iron sulphide would not be formed.

As to perforations: Tin is more resistant to the chemic action of the acids that occur in fruits and berries than ste The small openings through the surface of the tin coating coke plate permit of access to the steel by the acid contents the can, especially when they occur over pitted areas of the ste surface which may extend from one-quarter to one-third throu the steel sheet.

This contact of an acid solution with two metals of differe electric potentiality forms a battery cell. Tin and steel a such metals and under certain conditions that may exist in a c made of coke plate and filled with fruit or berries, the steel the pole of the battery where destructive disintegration occu with resulting perforation.

While it is probable that perforation may result from d structive chemical action, independent of electrical action, t formation of a battery cell as above described is believed to the principal cause of perforation.

Again, if we could secure steel plate uniformly and cor pletely coated with pure tin in the right form for resisting cher ical action, there would not be sufficient loss from perforati to be noticeable.

That you may see clearly the pinholes, waster spots, di coloration, etc., I call attention to micro-photographs of t plate, coke plate, charcoal plate, etc., which, for your conven ence, will be thrown on the screen. (The room was darkene and the photos shown on a screen.

These micro-photographs of sections of tin plate as mad today show clearly conditions that are important factors in ou problem, but which are scarcely discernible to the naked ey When, however, defects are magnified to the extent of 200 dian eters, their character may be readily seen.

The important question is, can they be eliminated? Th problem has been studied for some years, but is so completel involved in the question of present-day rapid production that n practical solution has as yet found application in commerci practice. To go back to the old practice of dipping three time would eliminate the pinholes and most of the microscopic waste spots, but would add very greatly to the cost, because of th interruption of the process and the increase in amount of ti used.

Unfortunately, tin is not a very abundant metal. It is foun in comparatively few localities in sufficient quantities to b mined profitably, and the very great increase in its use tend to advance the price. It is, therefore, highly important that i considering this question we recognize the fact that if we woul have a much thicker coating of tin than is used at present, w must pay a very much greater price for it. The amount of ti now used, if evenly and continuously distributed over the whol of the surface of the steel plate, would have better service valu

How can this be done without increasing the amount of ti used? We have been told emphatically more than once tha there are no methods by which it can be, and that we must b satisfied with the product as now produced. We are not conten with this dictum, and many others are not, as is evidenced b research work that has been carried on during the past year.

I am pleased to show you another set of micro-photographs

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

A. This is a picture of steel plate as now prepared for tinning by the pickling process. Note the irregular and scaly char-character of the surface.

B This is a picture of steel plate prepared by a new process which, briefly, consists of removing the scale and changing the character of the surface by scratch-brushing it with rapidly revolving wire brushes. Steel plate has been prepared in this way for tinning because of a theory advanced by Bielby, which is to the effect that in polishing a metal surface the crystals flow, and the soft crystals flow more than the hard, so that in polishing steel a ferrite surface is obtained. By a ferrite surface is meant a surface of pure metal The advantage of having a surface of pure metal is that it will unite more thoroughly and readily with tin.

C. This picture is from a micro-photograph of steel plate pre pared by the scratch-brush method and electroplated with very small amount of tin, about sight ounces to the base bo The plate has a soft and attractive appearance to the unaide eye, but the microscope seems to show that the tin has bee deposited upon the ridges and not in the valleys. The hop of the inventor that he could make good plate with even les tin than now used on coke plate does not seem to be born out in this instance. A practical method for electroplatin steel with tin has, however, been discovered that gives prom ise of improvement and economy in making tin plate.

D. This is also a picture of plate prepared by the scratch-brus method, but tinned in the usual way with no more tin tha is found on coke plate. Note that there are no pinholes. Sev eral sheets of this plate have been furnished me by the in ventors, and seem to have some advantages. For instance

ROBERT A. SINDALL, *President-Treasurer* HARRY R. STANSBURY, *Vice-President*

it is possible in preparing in this way to cheapen the process by eliminating the second annealing and possibly the pickling. If carried on in the manner designed by the inventor, the plate will be prepared without strain hardening. This is very important if we are to use a thin coating of tin. If the surface of the plate is hardened so that it is in the nature of a crust, it cracks and splinters when the plate is acutely bent or stamped and comes through the thin coating of tin. If, however, the surface is free from this strain hardening and the plate is reasonably soft, splintering does not take place and the coating of tin is left intact. It is claimed by the inventors of this process that when once installed plate can be made more cheaply than by the present process, and quite as rapidly. It is further claimed that the method permits of an easy ocular demonstration of defective spots, due to corrosion and impurities in the steel. Being at once apparent, this defective plate, that will not take tin uniformly, can be rejected before tinning.

Some years ago the paper industry was confronted with complaints because of the occurrence of defective sheets in the paper offered to the trade. These sheets were spotted, discolored, and sometimes torn. To eliminate this trouble the parties interested appealed to the Bureau of Standards, which rendered valuable assistance in arriving at methods that would eliminate the defective paper, with the ultimate result that paper can now be secured in which the defective sheets have been reduced to one in ten thousand.

Is it not probable that the Bureau of Standards could aid us in doing equally well with tin plate?

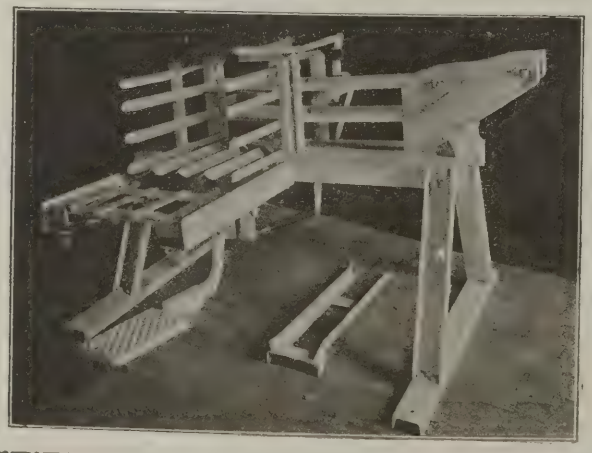
One of our greatest troubles has been the disposition on the part of those representing the tin-plate interests to minimize the disadvantage of using waster plate in canners' cans, and even to defend its use. I do not know of a single canner who would willingly have cans made of waster plate, but the present practice of tin-plate manufacturers, which follows an old custom, requires the purchaser of tin plate in quantities in this country to accept the wasters arising. Much of this defective plate gets into the cans which are distributed to canners notwithstanding the somewhat crude efforts on the part of canmakers to eliminate it by sorting. Canmakers ought not to be required to do the difficult work of sorting out waster plate, and that plate reasonably free from wasters can be furnished is evidenced by the fact that such plate is shipped in the export trade. It is, however, designated "all primes—no wasters," as distinguished from "prime" as sold in this country and carrying a considerable percentage of wasters, sometimes as high as 10 per cent, and in addition to this there is from 12 to 15 per cent of acknowledged wasters which must be accepted by the can manufacturer. Under present conditions of rapid manufactur in canmaking plants this ancient practice is no longer justifie This would not be necessary if a method was adopted that woul permit of detecting at the source the defective steel plates whic do not take, under any kind of treatment, the tin throughou their whole surface area, and, as stated before, it is claimed b the inventors of the scratch-brush method of preparing plat that these defective plates can be readily recognized and re jected when finished by their method.

Let us see what might be accomplished from an economi point of view of the defective steel that makes waster plate wa eliminated at the source.

The Department of Commerce reports that 2,707,648,71 pounds of tin plate were manufactured in the United States dur ing the year 1922—the last year for which final statistics ar available. If we take the moderate figure of 15 per cent for th wasters accruing, we have more than 4,000,000 base boxes o waster plate produced. This waster plate carries approximatel 6,000,000 pounds of tin. It is a conservative statement that a least 20 per cent of waster plate cannot be economically use for any purpose and must be scrapped. We, therefore, hav scrapped with it approximately 1,200,000 pounds of tin.

There certainly seems to be a considerable leak here tha might be stopped. In fact, this looks like an inexcusable wast of tin. In addition there is a large loss from freight paid upo this heavy material when shipped from tin plate mills to vari ous points, where it is cut up and part of it used—too often fo canners' cans.

Certainly the saving of this tonnage of tin and freigh charges, which would amount to not less than $1,000,000 a yea would seem to be worth while. A million dollars as conserva tively used as is tin for coke plate would go a long way towar paying the cost of detecting and eliminating defective steel plat at the tin mills, if not at its source. Such steel could, of course be melted over again and used for some purpose just as defec tive paper is returned to the pulp tanks.



It is not to be expected that radical changes in the metho of preparing and tinning plate can be introduced immediately i the tin mills of this country. There must inevitably be a ver long period of experimental work connected with developin machines and organization of methods to carry out any chang of practice, and if finally a new method is found to be advan tageous, it will take another long period of at least two year to make and install machines. We cannot, therefore, expect plat to be prepared for us by an entirely new method within a fe months. We can, however, take some courage in the knowledg that efforts have been made to improve the method of preparin plate and that some success has been obtained in an experimenta way.

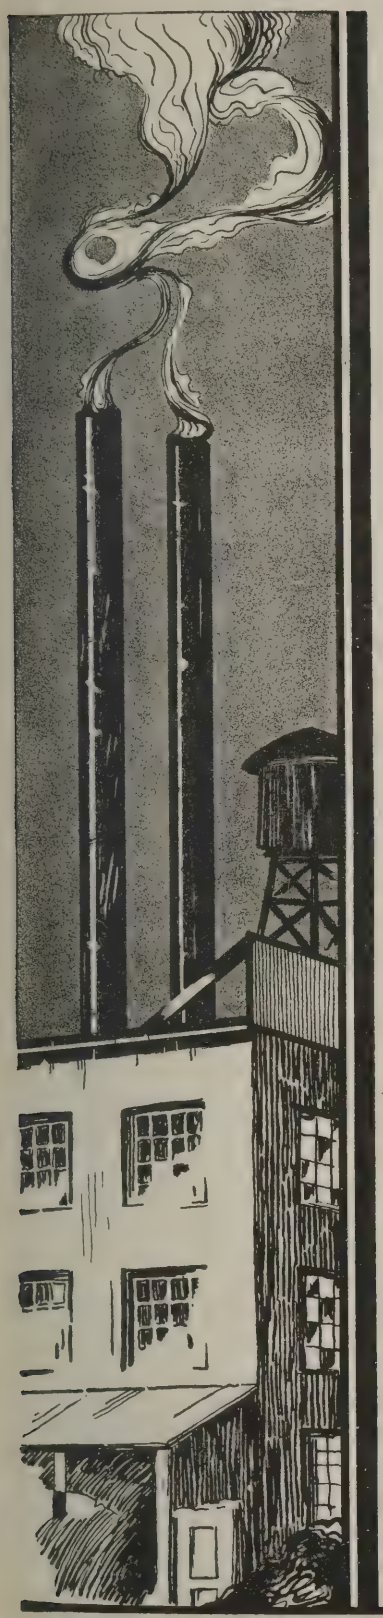
The New KYLER BOXER.

A machine, simple in construction, positive in action, which takes the cans from the Labeler – or Automatic Cooker – as fast as they come and places them in the cases without injuring the cans or Labels. Sturdily built to last a lifetime; all metal – operates either by foot or hand – both furnished with all machines – always on the job.



BALTIMORE, MD., December 6, 1923

It is with great pleasure we write you regarding the performance of the Boxing Machine we purchased from you this season. The features of this machine are too numerous to mention in this letter, but if you have, at any time, an interested prospect who desires to communicate with a present user, we will be only too glad to tell them of the many advantages we have found in using this machine. As a labor saver, it cannot be beat, and its construction could not be better, in our estimation. Very truly Yours J. H. Roberts & Co.

Manufactured and Sold by

Westminster Machine Works

Westminster, Md.

SPRAGUE-SELLS and Peerless Canning Machinery will be the staunchest—the most efficient, durable and dependable that fine materials, experienced workmanship and sincere purpose can make them.

Every machine bearing our name will be backed by an unequivocal guarantee of complete satisfaction—or money refunded.

Field service—unstinted and gladly rendered will be constantly available to the users of our equipment—with a corps of experts at their command to aid in the solution of any problems that may arise.

The prices of our machines will be kept preeminently fair at all times by adjustment to conform with labor and material costs.

Our prices will be standard—one unvarying price to all. You purchase our machines with the satisfying knowledge that your investment is precisely the same as that of each and every other purchaser—no higher or no lower.

This is the platform upon which Sprague-Sells and Peerless Canning Machinery is offered. We believe it will win the instant and sincere commendation of everyone intimately associated with the Canning Industry.

From our two plants, at Buffalo and Hoopeston, we can supply practically every item of canning equipment.

Write us today for quotations on any equipment you may need, addressing your inquiry to:

SPRAGUE-SELLS and PEERLESS CANNING MACHINERY

It is not to be expected, however, that much progress will be made unless canners generally make it manifest that they earnestly desire it, but this desire must of necessity be tempered with patience and tolerance in view of the very great difficulties incident to the radical changes in a large industry.

In connection with research work that is being carried on with a view to improving tin plate, there is another important problem, and that is the quality of the tin used. To give the best results it must be reasonably pure; that is to say, it must be free from an excessive amount of lead which is rather a common impurity in tin. It is a matter of common knowledge that the tin plate of today discolors independently of iron sulphide and more especially when iron sulphide is not formed. This discoloration is said to be due to tin sulphide, but may sometimes be in part due to the black salt of lead from the impurity of the tin. The question has been repeatedly raised by canners as to why the cans of today are so generally blackened inside when such was not the case with cans of a former period to anything like the extent that it now occurs. It has been explained that the acid zinc flux used in considerable quantity on the old-style can inhibited the formation of tin and iron sulphide. There is, no doubt, some justification for this statement, but it does not cover the whole case.

The cans of a former time when made with rosin flux did not give as much trouble from black discoloration as the cans of today, and there are cans now made, with no more acid flux than is used on the cans in this country, that do not blacken as much as American plate blackens. Some study has been made of this question which brings out the interesting fact that tin, like carbon, occurs in several allotropic forms, and one of these forms is not quite as soluble or subject to electrical action as the other. This question of the different allotropic forms of tin and the characteristics of each of these forms has not as yet been fully investigated; in fact, there seems to have been less research work in connection with this than the importance of this subject to canners justifies.

I recently submitted two sample cans of peas to one of the professors of the Institute of Technology in Massachusetts. They were both modern cans, sealed without solder, except so far as the side seam was concerned; both cans packed a year ago last summer—one can packed in Belgium and the other in the United States. The inside of the can packed in Belgium remained bright; the American can, as is commonly observed, was pretty thoroughly blackened. The analyst makes the following report in regard to these two cans:

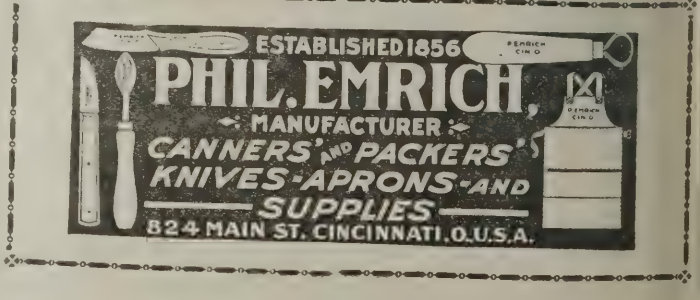
> "On etching the two samples of tin plate, one from a Belgium can and the other from an American can, it was found that a water solution of ferric chloride had no effect on the Belgian can, but gave square patterns on the American can. This shows the stained American can was more easily attacked than the other, and from the form of the pattern this might be due to the presence of rhombic tin. The metallographist suggested, however, that it is more probably due to impurities in the tin, especially lead, which is a common impurity and which gives a black sulfide. If you wish to have a chemical analysis made which would answer this question, please send several cans of each kind. The tin could probably be removed by melting. In case you wish to have the analysis carried out, please also let me know whether you wish qualitative or a quantitative analysis. I should think qualitative analysis would be sufficient for the present.
>
> "I have paraffined the backs and edges of the two samples and set up the following cell:
> "American stained tin plate.
> "10 per cent sol. of stannic ammonium chloride.
> "Belgian tin plate.
>
> "At first there was no difference in potential or electromotive force at all, but within an hour 0.04 volt had developed, with the American plate the negative or soluble electrode. If the two different kinds of tin were present in the surface of tin plate, this would be enough difference to cause one to dissolve or form some compound such as sulfide. I do not care to put much weight on these few preliminary measurements, however."

This is, of course, a preliminary statement and cannot be taken as conclusive until considerable research work has been done. Canners can have this work done if they are sufficiently interested to ask for it.

I believe it is of great importance that we should have de nite knowledge as to the purity of the tin used on the plate fro which our cans are made, and that we should know definite which form of tin is the most resistant to chemical action.

It has been more than once reported to me that cans th have been carried over a year show less tendency to blacken a perforate than cans that are freshly made from new plate. such is a fact, we should know why. At present we can on guess. This, too, can be determined by adequate research wor

It will be seen, therefore, that while the situation as to t quality of plate from which canners' cans are made can be som what improved promptly by an adequate system of sorting a classification at the source, the real problem of securing pla free from this large percentage of wasters and free from t pinholes which are inevitable in plate as now made is a difficu one. We cannot expect the manufacturers of tin plate and ca to undertake to solve this problem unless we make it appare that we earnestly desire it and are willing to lend our hone co-operation.



Current controversy with grocers over the question of spoi age gives emphasis to the importance of this question and fu nishes an adequate reason for earnest effort on our own part search out a method that, while permitting plate to be mad rapidly and in great quantities as it is made today, will still giv us plate that is better protected by a uniform coating of tin tha that which is now generally manufactured as coke plate and so universally used in the making of canners' cans.

No committee of your Association can do this for you with out evidence of your earnest interest and support. If you be lieve that it is altogether worth while that research work shoul be continued, especially from the canners' point of view, yo must emphatically and clearly make it manifest, and you mus further show willingness to bear your part of the expense inc dent to this research work. We have been, perhaps, too pron to lay down and "let George do it for us" in the matter of ti plate and tin cans. Cans, however, should be considered lik any one of the other raw materials that we use. We must kno enough about them and their quality ourselves to be able t specify what we want in order to get it. This is really not a difficult as it seems if we once put our minds to it.

Let us refuse to remain in this quagmire of spoilage and it resulting contentions with our good customers. A problem o the kind that confronts us is not unlike disease. No disease ca be cured by treating the symptoms. The cause must be foun and eliminated. When once an accurate diagnosis has beeen ar rived at, it is comparatively easy to fulfill the indications; tha is, a definite line of action reveals itself. Now, until we ar satisfied and can satisfy others that our diagnosis as to th cause of that class of spoilage which occurs after goods reac the trade—one or two cans to the case here and there, which i the kind of spoilage that is giving us the most serious trouble we will not be able to eliminate that source of loss and worry that has been the bete noire of canners for the past few years The warehousing plan is a good temporary expedient, and will no doubt, if properly carried out, help to arrive at the facts but in the meantime we should not neglect other methods tha will make our diagnosis acceptable to all parties concerned.

Let me emphasize again that we must take up this matte with a spirit of patience and tolerance. We must recognize the great difficulties involved from the manufacturing point of view—that up to the present time the greatest problem of the manufacturers of steel and tin plate in this country has been that of adequate production. This has been creditably solved.

Let us now insist that the same energy and enterprise that has made the United States the largest producer of tin plate in the world be turned toward improving its quality, and let us further agree that we will lend all practical assistance and retain an open and friendly mind until our object has been obtained.

Automatic Scroll Shearing Machine

An original machine used to cut strips in staggered formation for the making of can ends in our Automatic Strip Feed Presses. This method of staggering permits greatest economy in material, and maintains the high output established by our Presses.

The machine accommodates stock up to 30'' x 30'' and has sufficient capacity to supply strips for several presses. The material is automatically cut and trimmed while being produced A safety device is provided, which prevents accidental starting of machine, and all working parts are carefully guarded. For all can ends up to No. 3 size the economy of scroll strips exceeds all other methods and shows a saving amounting to as high as 7% according to size handled.

Upon request we will be glad to furnish detailed particulars showing the saving in material this process affords.

THE Buffalo Entertainment Committee for the National Convention said in announcing the Convention: "We promise you that every minute of the National Canners' Convention not devoted to business will be crammed to overflowing with wholesome fun." And the unanimous verdict is that they made good on this promise.

This committee, and all Buffalo, certainly did everything that could have been expected of anyone to make the Conventionites comfortable, and then stay enjoyable; in fact, the whole town seemed to take part in entertaining the visitors. We have commented upon this fact before, and we repeat it here because Buffalo is entitled to this credit. And to make good they had to battle against Old Boreas and all his legions, for the weather was bad, to say the least.

It is not possible, of course, to recount the pleasures of the Convention. There were dinner parties, theatre parties and small and large group meetings for the purpose of entertainment every day and almost every hour, so this account covers only the set, or formal, entertainments. We set a new standard for Convention reporting this year, making it all business and nothing else but business. This was disappointing, we know, to many who hoped and expected to see their pictures and a few words of commendation and praise in the "Convention Issue," as had always been done. In fact, that is the only reason a lot of men ever look at a Convention issue—to see their pictures and to learn what seven-day wonders they are, and just in proportion to the degree of that wonderment—and the "goodness" of the picture—is the Convention issue "the best ever" or—worse. There is always so much "bull" of that kind spread by the others that we thought it wise to sow the seeds of wisdom as we did.

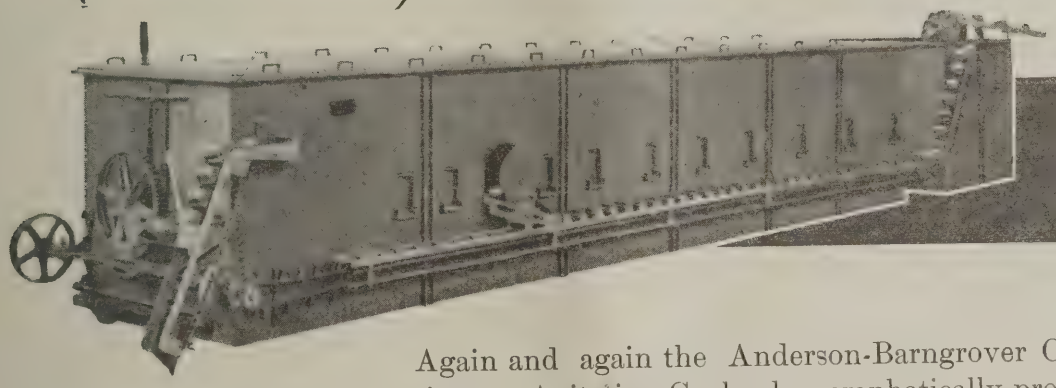
There is one man, however, who deserves special mention and the publication of his photograph, and that is Millar W. Sells, Chairman of the above-named Entertainment Committee. And here he is. He anticipated every want or convenience of the Conventionites; was in constant touch with everything that was going on—busier than any proverbial bird-dog anyone ever heard of, and through it all kept smiling and working. And if you think it isn't work, just try it once. President Englehart, of the Canning Machinery and Supplies Association, at their annual meeting, praised him as he deserved. You have read that on page 34 of our Convention issue.

LADIES FIRST, ALWAYS—That seemed to be the motto of the Entertainment Committee, and everyone agreed with them. So the ladies, whom they knew had come to the Convention for amusement, while the men worked—the standing joke since the first Association was formed in 1882—were taken in hand early Tuesday afternoon and given a delightful luncheon in the Fillmore room, and there was no attempt at a pun in the selection of that particular room. A handsome special menu, in blue and gold, contained the very things calculated to tickle the hearts of the ladies, and about 275 of them would cheerfully testify that the hotel surpassed itself in its service. Afterward they were escorted downstairs to the Ballroom, where an elaborate musical program was rendered, with Buffalo's leading soprano as the soloist, Mrs. Agnes Preston Storck. This musical was broadcasted by WGR, and the next day Mrs. Storck called Chairman Sells to say that she had had approximately 15 telephone calls from people who had heard her over the radio, and who stated that the music and singing came through clearer than any other concert they had heard. There were about 325 present at this concert and all showered praises upon the Committee as representing the Canning Machinery and Supplies Association, who were the hosts. Mrs. Daniel G. Trench presented the appreciation of the guests by calling upon all to rise in honor of their hosts.

VISIT THE CANNED FOODS SHOW—Again the ladies the Convention were the guests of the Supplymen, w provided autos to take the entire party to the Cann Foods Show in Elmwood Music Hall. This took place Wednesday afternoon.

THE BIG DINNER DANCE—Wednesday evening the N tional Canners' Association held its subscription Dinr Dance in the great Ballroom, and every seat was tak It is necessary to limit this affair to 400 people—not THE 4 particularly, but because it is not possible to seat and wait up a great number than this. They ate and danced to a late ho and the handsome women, gorgeously gowned, passing throu the surging crowd of brokers, canners and others lent an air festivity which all enjoyed. It is to the credit of the Committ

MILLAR W. SELLS



Who put the Buffalo Convention on the map. A real host.

that for the first time since the Hotel Statler was built th were able to induce the famous Vincent Lopez Orchestra to lea the dining room and come into the Ballroom. Mr. E. C. Gre manager of the Statler, did this as a token of his appreciati for the Convention.

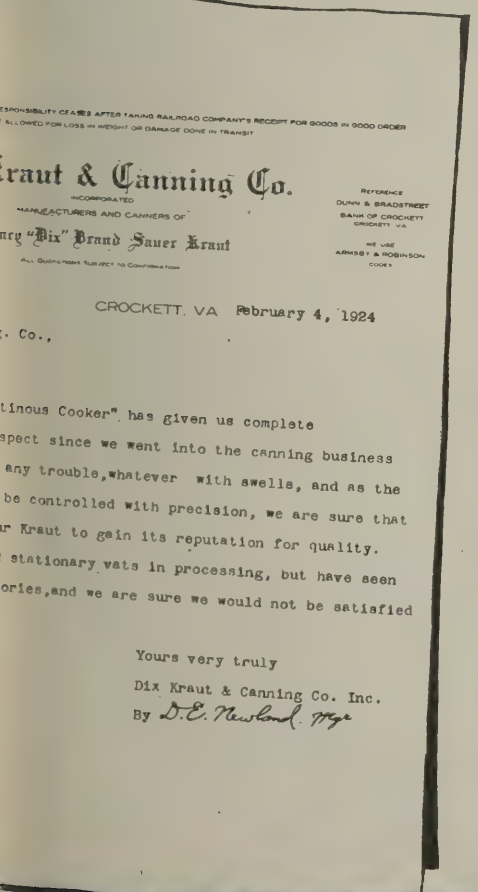
THEY GO TO NIAGARA FALLS—You know I am not or getting a lot of you fellows who refused to bring "t wife" to the Convention into serious trouble telling abo all these good times and the way the Canning Machinery a Supplies Association lavishly entertained the ladies, but am ris ing my own neck. But the truth must be told, in justice to the generous hosts. Not content with all they had done thus f they had Millar Sells turn off the wintery blasts and put on t Spring Song sort of weather, so that the ladies might view Nia

'TATING COOKING and COOLING

duces *Perfect* Cooked Foods Unsurpassed *Uniform* Appearance

Again and again the Anderson-Barngrover Continuous Agitating Cooker has emphatically proved its ability to deliver unmatchable cooked foods as the indisputable proof we hold over authorative signatures shows.

For them A-B Continuous Agitating Cookers put quick, uniform heat penetration into every can thereby conserving nature's own color and appearance–nature's own flavor.



Coolers of similar design make sure the cook is stopped before the cans are stacked, eliminating the uncertainty of air cooling. With every cooking expense largely economized, some entirely eliminated, A–B units give their users a finer product, at enough less cooking expense to return them the initial cost – in other words, their Cooker cost them nothing.

Are you looking for a good cooker for nothing ?

ara Falls in all its winter beauty, but in the balmy weather which the ladies enjoy. They were taken to the Falls, shown all that is to be seen, and given a neat luncheon at the Falls, and then brought back in time for the Theatre Party. A veritable cavalcade of autos was commandeered, the weather had turned warm and delightful, and the ladies had "just one grand, good time." And talk about a bargain—which the ladies so dearly love—it never cost them a cent! And they had no sooner gotten back to the hotel and began to dress for the theatre, than Old Boreas got busy again and sprinkled snow from then until the end of the Convention.

THE PRESIDENTS' BALL—We are bringing this in ahead of the big theatre parties on Thursday night, because the above-referred-to unfavorable weather took a decided hand in this, the most pretentious thing a Canners' Convention has ever attempted. The idea was to honor all Presidents of the Associations, and a really grand affair was planned, and was enjoyed by all present, many remaining over particularly to do honor to those to whom honor is due. We are told that there were about 400 there. It was held in the great Ballroom. About 11 P. M. the Committee lined up all the present Presidents and as many Past Presidents of the three Associations as were present, and a Grand March was started, that everyone might pay his or her respects to the men who had done so much for this industry. The Presidents formed a reception, or reviewing, committee, and the marchers filed past them, and they beamed their pleasure at this homage.

THE THEATRE PARTIES—The American Can Company, in its always generous manner, took the whole Convention to the theatre on Thursday evening, some of them to see, or to hear, Bitzi in "The Magic Ring," and others to "The Greenwich Village Follies." The Convention always waits for this treat, and it is never disappointed.

President Royal F. Clark spoke the thanks of the Convention, and President H. W. Phelps responded, adding some timely advice that will be found very well worth serious reflection. President Phelps said:

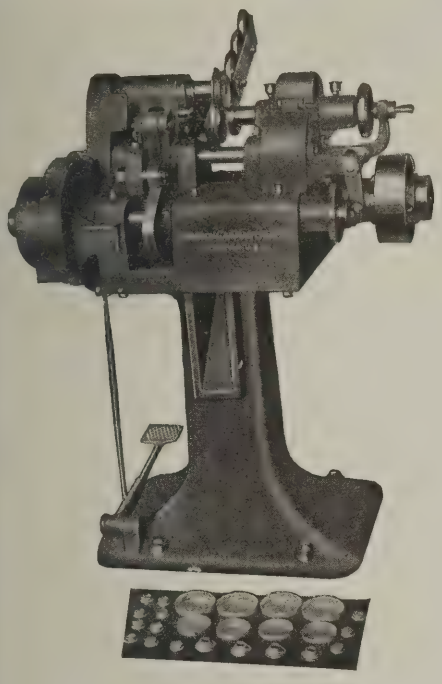
TAXES MUST BE REDUCED

Address of President H. W. Phelps, American Co.

MR. PRESIDENT, Ladies nd Gentlemen: I thank you from my heart, Mr. President, for those cordial words of introduction. I assure you that in behalf of our company, my associates and myself, I bid you a most heartfelt welcome. It hardly seems a year since I stood before you, but it is. I know we are a year older. I hope we are a year wiser. I hope you are several years richer, and I believe you are. I believe that I can come before you, gentlemen, and congratulate you on the year 1923 and its results. I believe your market condition is good. I believe your bank accounts are good. I believe you are in good shape as an industry and as individuals. I certainly congratulate you and I certainly wish that the year 1924 may be even kinder to everyone of you than the year 1923.

I believe in the year 1924, as the President has said, but I am a kind of reservationist, and I believe that there are a few reservations, or, at least, a few sober thoughts with regard to 1924, bright as it may seem. One of the wisest men and one of the best friends I ever had used to say "when the sky is bright, look out for storms." I believe that is a wise thing to do. We sometimes do not watch so closely when we are in the car and the going is good; we drive a little fast and do not see the skiddy places until we hit them—therefore, I believe that all of us, you and I, the industry that you represent and that I do, which are so closely interwoven, should look out for the skiddy places and drive carefully, although surely and brisky and well through 1924. Within this country we are prosperous, but we are fictitiously high. Labor is high, taxes are high, transportation is high. These three things make the cost of living high. Ladies and gentlemen, they have got to come down. The world demands that they come down by the law of supply and demand and competition, and unless we bring them down we cannot compete with the rest of the world.

A proposition has been made by a man who I think is a wise man—I think the greatest Secretary of the Treasury that the United States has ever had, not even barring Alexander Hamilton—and he has shown us the beginning of the way. I say the greatest and mention Alexander Hamilton, who put the affairs of the United States for the first time upon a sound financial basis advisedly. Alexander Hamilton did wonderfully, wisely well in the day in which he lived, but Alexander Hamilton did not have the problems that Andrew Mellon has had to face. He might have faced them just as well—I don't know—but I do know that among other things the United States has been blessed for the last three years with a wonderfully wise, sagacious man at its financial helm. I believe he has shown the way to a reduction in taxes which means a reduction in the cost of living. I believe it is the beginning of the end. I believe that taxes will be reduced because I believe that the plan that he has outlined commends itself to the sturdy, hard common-sense people of the United States. I believe wages will follow. I believe transportation must follow, because transportation means wages. Then, the cost of living comes down, and we come nearer to competition with the rest of the world, where we must be if we live anything but an isolated life. That, I think, is the condition internally. We are rich; if anything, we have too much gold. Perhaps we are too prosperous, but at the same time that is our picture. As I look it seems to me that we occupy this side of the horizon upon which the golden bow of promise shines. It seems to me that there are in the many colors of that bow, peace, happiness, prosperity, and as it hangs over us we see its light, and we gain hope for 1924 and for the years to follow.



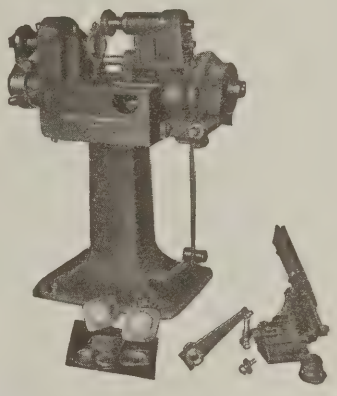
But, ladies and gentlemen, look on the other side of the horizon. Over there, lying low, but unmistakable, are some dark, sinister clouds that roll up and down, black and forbidding. In the middle there is Germany, desperate, hopeless, helpless, money gone, credit gone, energy gone, ambition gone, thousands and thousands of eyes looking out with the light of desperation from starving faces. That is a black cloud, indeed, and there at the side of it, a little lighter, perhaps, but still dark and gray, is France—currency running down by the minute, credit strained to the limit, feet entangled in the Ruhr and nobody knows how to get them out, unable to pay her debts or the interest on her debts, talking about an increase of 20 per cent in taxation upon a people already taxed to the limit. What of her? I don't know—do you?

Over on the other side, England. A little lighter cloud, it is true, seething, however, and writhing with unemployment, hundreds of thousands of people out of work, hundreds of thousands of people clamoring for something they know not what. That is shown in the change they have made in the last week, taking up the experiment of a Labor Government for the first time in history so far as the civilized world is concerned, except Australia, a minor province. It is an experiment. Will it be for her good? Will it increase her financial responsibility? Will it make her credit better? Will it give employment? They have an engineers' strike, paralyzing the railroads, staying manufacturing, a strike out of the hands of the labor unions or the Labor Government. Are conditions there such as to be a reflection of that rainbow? And back of it all, dark, deep, somber, lies Russia, a very large proportion of the world in black, disorganized despair. We read in the papers that Lenin is dead. Lenin, who has written his name upon the pages of history as a man of indomitable courage, of fanatical determination, of enormous ability, but the record stands there as simply another story of what those characteristics mean when they go wrong and it is written in letters of distress, trouble, starvation, the wreckage of a people. And what after Lenin? Do you know? I do not. God alone does.

Now, ladies and gentlemen, I am not painting a fancy picture here. Those clouds are there in their blackness and sinister colors just the same as the rainbow is over here, and because we happen to be under the rainbow we are inclined sometimes to look straight up and think it covers the earth. Now, I am not a prophet of evil. I do not say all this because I am a pessimist. I am not. When you and you and you and I rejoice in our present prosperity and look about us and think we are happy, we are doing well—we have finished a good year, we are coming to another, so we hope and so we believe, but back of it all there is the truth that we are part of the world. I believe that our Government wisely has decided to stay out of the entanglements going on under those clouds. I don't advocate going in there. I don't believe we can do any good if we do. On the other hand, nobody can stop the influences of those clouds upon us because we are a part of the world.

Now, will those clouds mount and mount and mount until they shut off the sun which is the source of the light of the rainbow and thereby extinguish that light or will the light of that rainbow with the beneficial help of the sun finally dispel those clouds? I don't know, do you?

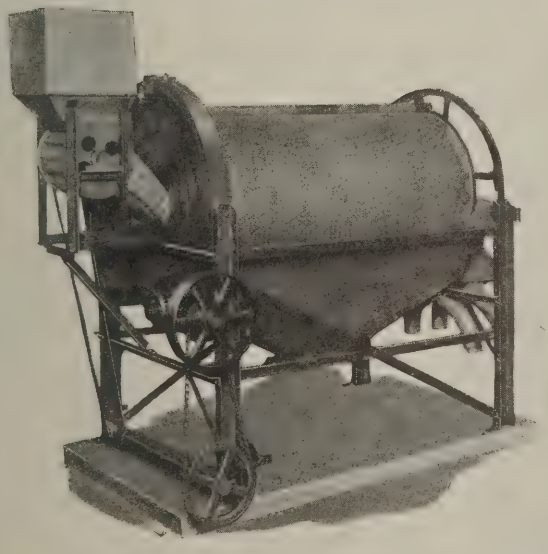
I believe the thing for us to do is to help that rainbow spread by optimism, by courage, by industry, by frugality, by saving, to use the influences that we have in a proper way to bring about a dissolution of those clouds and to spread the sunshine that gives life and health and happiness on all horizons. May that be the endeavor and achievement of the canners and their allied industries and friends during the 366 days of 1924. (Loud applause.)



ONE BLOCK AHEAD OF THE PROCESSION

This No. 46 Thread Rolling Machine is worthy of a place in the "CAMERON FAMILY."

One user writes: "I find it a great advantage to be able to remove the automatic feed when I have odd-shaped articles to be threaded."



We make every machine for "can-making."

CAMERON CAN MACHINERY CO.

240 North Ashland Avenue CHICAGO, U. S. A.

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

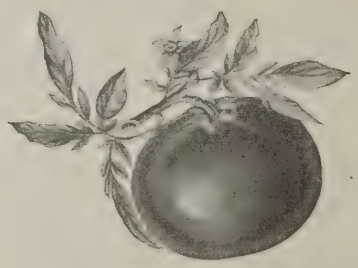
Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.



Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

THE MACHINERY SHOW—The Machinery Show does not belong in the list of entertainments, and yet it is the most popular entertainer of the whole Convention, and admittedly is the drawing card which attracts the crowd to the Convention. To describe the Machinery Show, or the individual exhibits, now, a month after the Show has passed into history, is about of as much value as to describe a circus after it has left town—it makes good material for testimonials, but is of no other value to the exhibitor. We described this big Show in our issue of January 14th—before the Show—so that the visitor to the Convention had an opportunity to visit and see the exhibits. We helped the exhibitor make a success of his exhibit, and we know this was appreciated.

In justice, however, we must say that this year's Show was one of the best ever put on. It was well housed, despite the extreme cold weather of Monday and Tuesday, and the snow and inconvenience of Friday, the day when the exhibitors hoped for a real day's business. It was so very cold Monday and Tuesday that it was a real discomfort to travel to the Hall, and while many did so, most did not. Friday, with its snow, made the Conventionites largely seek the trains, and thus the best Show was not as successful, from a financial point of view, as others, and this is unfortunate. No one heard a wimper out of any exhibitor —they are not that kind—but it is unfortunate that the crowd could not freely visit the Show, take its time examining the exhibits, and then leave with the exhibitors the orders which they would have left under more favorable conditions. It would have been a record for business, we believe, if it had not been for the weather. Ultimately the exhibitors will reap the benefit, we believe and hope.

Buffalo and the Committee surpassed themselves, each individually, and everybody is loud in praise of this, but the usual mid-winter lake weather set in to undo the well-laid plans of all. It was so the last Convention in Buffalo, in 1906, and it was so in Rochester a few years later. It is benerally so in all these northern tier cities at this season of the year, and that is why so many men, who previously derided Atlantic City, urged us to advocate Atlantic City as the future Convention City without change. We promised to make known their wishes, and we have done so, and we believe that the committees having charge of the next Convention City will do well to listen to this general and insistent demand. All now realize how important is good weather, and experience has shown that no place furnishes so much of it, or in such fine quality, as the seaside resort, with its ample hotels and splendid exhibition hall. The vote at Buffalo was all for Atlantic City.

25 Million Tomato Plants

LET us grow your tomato plants this season. We still have enough acreage left to book about 25 MILLION more. We can give you fine field grown plants, grown on new land free from disease and will guarantee them to reach you in good condition. If interested write or wire us for contract prices. ∴

J. P. COUNCILL CO., Franklin, Va.

TOMATO IMPROVEMENT WORK TO BE CONTINUED DURING 1924.

Similar Work to Be Carried on With Sweet Corn.

A MEETING of the Tri-State Packers Association Executive Committee, representatives of the Extension Service from Maryland, Delaware and New Jersey, was held in the Du Pont Hotel, Wilmington, Delaware, Friday, February 15th, to discuss plans for conducting Tomato Improvement Work and start similar work with corn during 1924.

Dr. Symons, Director of Extension, University of Maryland, stated briefly Maryland's plans for 1924 and presented a budget showing amount of money needed to carry out the plans outlined.

Dean McCue of Delaware outlined similar plans. The Canners and County Agents of New Jersey are co-operating and will conduct similar work this year.

Maryland's plan is as follows:

Holding a series of meeting where growers and canners are co-operating to discuss the "Tomato Improvement Project" and to outline plans and make arrangements for "Centralized Tomato Plant Beds".

A set of lantern slides have been made up to illustrate the growing of tomato plants in "Centralized Plant Beds" and many other factors covering varieties of tomatoes, preparation of the fields, fertilization and cultivation in the field and diseases that are hindering the production of larger yields per acre.

The best procedure for conducting these meetings will be for canners and growers to get in touch with their respective county agents and express their desire to hold such meetings. Messrs. Ballard and Radebaugh of the extension service will be available to address such meetings and assist in any way necessary to make the "Tomato Improvement Project" a success.

The county agents are eager to co-operate with

both packers and growers in their respective counties and assist in conducting the project.

As the time is getting short before planting will be here it is advisable that both canners and growers express their intention to the county agent of holding meetings so arrangements can be satisfactorily made to have the specialist from the University Extension Service present. Let's make the quality of tomatoes in 1924 in Maryland the best ever produced.

Plans for developing reliable sources of tomato seed for Maryland growers were discussed and details for accomplishing this valuable phase of tomato production will soon be issued.

Another bulletin entitled "More Tomatoes From Fewer Acres" has been prepared by Messrs Ballrad and Radebaugh of the University of Maryland Extension Service containing many factors relating to the "Tomato Improvement Project" as conducted during 1923 in Maryland and will soon be available for distribution.

County Agents of Maryland; R. F. McHenry, Cumberland; G. W. Norris, Annapolis; W. C. Rohde, Towson; J. H. Drury, Chaney; L. M. Goodwin, Denton; F. W. Fuller, Westminster; A. D. Plans for starting similar "Improvement Work" with sweet corn as is now being carried on with tomatoes are being prepared and some work will be conducted this year with a number of canners who are saving their own sweetcorn seed.

BIDDLE NOW BUYING IN BALTIMORE.

THE Biddle Purchasing Company, whose name has appeared in these columns in days gone by, in connection with the tomato market, tell us that they have opened an office at 4 E. Redwood street, known as the Phoenix Building, and wherein several well-known brokers have their offices. This is a branch office, they say, and then continue: "Which will have control of the buying of Southern packed canned foods." It will not be surprising to many that Price will control the operations of this branch, but it is F. S. Price, Jr., who was formerly sales manager for the Lord-Mott Co., well-known canners of Baltimore.

The Biddle Company is growing, and now has offices in Pittsburgh, Chicago and San Francisco, as well as their head office in New York, and this new branch in Baltimore. Robert Nelson, manager of their grocery department, is a live wire.

CHISHOLM-SCOTT IN SALT LAKE CITY.

The Chisholm-Scott Co., well known makers of the Pea Viner and Bean Snipping machine, have made arrangements with the Cannon Supply Company, 151 W. South Gemple St., Salt Lake City, Utah, to act as representatives for them, and all matters pretaining to the Viner Department in the States of Utah, Idaho and Montana. They will also maintain a stock of Viner repair parts, and will serve the company's customers in California and Washington from it, as well as their own territory.

All matters pertaining to the Bean Snipper will continue to be handled from the Columbus, Ohio, office.

The Markets

BALTIMORE, MARCH 3, 1924

WEEKLY REVIEW

General Canned Foods Situation at Its Top—January and February Business a Record—Demand Undoing the Canners' Calling—All Spot Goods Cleaned Down to Vanishing Point—Reliable Goods Are Selling Freely as Futures—Future Prices Heard This Week.

BUSINESS AT TOP—Canned foods have been selling at such high speed during the past few years that we wonder if the industry has not grown spoiled, or incapable of appreciating any business unless it be in a rush and up to a record. No canner of any standing—that is, of any years' experience in the business—ever expected to see spot canned foods cleaned as they are today after the size of the previous year's packs. It constitutes a record that the industry does not seem to grasp. Business is said to be quiet; that there is a steady outgo of the goods, the retailers and jobbers taking them in fair quantities to supply their immediate needs, but that there is no "vim" to the selling. As a matter of fact, the buying is of the kind that is eating down the visible stocks at an alarming rate. Even the most bearish buyers admit that the indications all point to a complete cleanup of spot goods before new goods can be produced, and yet, considering the sizes of the 1923 packs, the industry thinks the market is quiet! We are getting too blazé for anything, and that is the real condition of the market rather than anything else.

As a matter of fact, we are making records every day, and ones which it will be hard to equal in the years to come. We may do so if we keep the quality of the goods to a high point, and keep the consumers wanting "more"; but in their present frame of mind the canners will not consider the market as active if it merely takes up the packs of goods as fast as the canners produce them. The canners are supposed to conserve Nature's bounty in the time of plenty for the bleak days of scarcity and want, but as things are going now, they are not able to hold the goods long enough to reach the normal days of bleakness or scarcity—the buyers take the goods away from them long before those days.

The first of March—Canned Foods Week—and canners in almost every section reporting their warehouses cleaned out of goods! Peas cleaned up everywhere; corn gone from the great Central West and about gone from every section except Maryland, and not much of it there. Tomatoes cleaned out of everywhere, except some reported in Utah and some in the Tri-States, but mighty scarce there, or they would have come out in the "dull" period. Fruits, vegetables, specialties and all lines of canned foods in this same remarkably well cleaned-up condition. It is simply a record worthy of note. Why quote market prices under these conditions? The market is what the holder chooses to make it, dependent upon the quality of his holdings. The game now is to find the kind of goods needed, the price follows as a matter of course. You will note there are no changes in our market pages.

FUTURES—And what is true of spot canned foods is nearly if not as true of futures. Speaking with some old, time-worn canners of experience, they admitted that they had never seen the business in such splendid condition. They admit that they have never done as much business in January, and again in February, as they have done this year, spots and futures. And it has been "easy" business—no haggling over prices, terms and conditions. Most of the old-established canners in all lines have sold well of futures. A great many of them have practically withdrawn from the market. Of course, there are some canners who still want some business; there must always be such. Where the goods are known for their reliability they have not been able to hold off the market. There, possibly, is the greatest lesson in quantity packing of them all—the goods that are known are sold, or as one well-known canner put it, taken away from him at the prices he chose to put on them. Thousands of cases of such goods have been sold without price, the buyers merely wishing to be assured that they are covered in their requirements. That is the kind of confidence which makes business pleasant.

Peas and string beans seem to be well cleaned up, as futures, in all sections of the country, the Eastern or Southern canners having sold peas quickly as soon as they announced prices. Corn does not seem to be moving as quickl yas those canners might wish it, but it is selling, and at fair prices. Where the effort to improve quality has been made, the canners are getting better business. The future market on corn, however, is so much on a par with the spot that the buyers do not feel an inclination to "cover." This is affecting corn futures. But, again, private information from some of the large Central Western canners report about as many futures on their books as they wish. It is supposed these are at going prices. Tomato futures have been remarkably well sold for this time of the year. The Tri-States did not feel inclined to name future prices until just recently, because they were not sure of their growers' prices. While they waited Indiana largely sold out, Utah cannot be far behind, and other States are reporting one after another canner withdrawn. This week we reproduce a communciation from Virginia which intimates that they are going to demand a profit on their tomatoes for 1924. For some unaccountable reason the Tri-State canners seem to be trying to make the other canners of their section lose money—that age-old game of such canners. They see Indiana and the rest of the country selling future tomatoes to their limit at from 15c to 25c per dozen above prices quoted here, but that does not mean anything to them. Possibly it is the class of sellers to whom we referred last week that is tinging the whole picture, but if so, it is a most unfortunate thing. The Tri-States might easily advance its prices from 5c to 10c per dozen on futures and get the business if it had some backbone.

In olden days New Jersey used to demand a differential over her two sister States—Maryland and Delaware—and the New Jersey man will tell you that there was a reason in the quality; but now Indiana exacts a differential over all the Tri-States, and it is due to the business ability of the Indiana tomato canner who packs quality and sells it for what it is worth. Let some of the Tri-State canners take that sentence into a corner with themselves and think it over. At present they are just sitting down thinking how the Indiana canner does it, and doing nothing.

FUTURE PRICES HEARD TO DATE:

Asparagus—Prices have been named by most California canners.

Beans—Stringless, Baltimore, cut $1.00 to $1.10; whole, $1.10 to $1.20; Michigan reported about sold up; New York State, No. 1, $3.00; No. 3, $2.15; No. 4, whole, $1.60; No. 4, cut, $1.25.

Corn—Maryland, varying, averaging from 90c to $1.00 for crushed; shoepeg, $1.25. Middle West, 95c to $1.00 for standards, with extra standards up to $1.10; fancy, $1.15 to $1.30; Illinois strictly fancy Country Gentleman at $1.35. Maine Crosby, $1.45; Golden Bantam, $1.70.

Beets—No prices heard as yet, though some have been sold.

Peas—Wisconsin, canners largely withdrawn and prices mainly nominal. Demand continues strong. New York State canners in about the same position, well sold up and prices very firm. Maryland and Southern No. 4 Alaskas are quoted at $1.25 in conjunction with other sizes;; No. 3s, $1.35 to $1.45; No. 2 sieve, $1.50 to $1.70, as to packer.

Tomatoes—Missouri: No. 2s, 90c; extra standards, 95c to $1.00; No. 2½s, $1.20 to $1.25; No. 3s, $1.30; extra standards, $1.35 to $1.40; No. 10s, $4.25 to $4.50. Indiana: No. 2s, $1.00; extra standards, $1.10; No. 2½ standards, $1.30; extra standards; $1.40; fancy, 2½s. $1.65; No. 3 standards, $1.40; No. 10 extra standard, $5.00. Maryland: No. 1s, 57½c; No. 2s, 87½c; No. 3s, $1.27½; No. 10s, $4.00. Virginia: No. 3s, $1.30; No. 2s, 90c.

NEW YORK MARKET

Canned Foods Week to Be Put on Large—Winter Weather Helps Canned Foods Consumption—Tomatoes Strong—Future Spinach Prices—Peas Well Sold—Succotash Scarce—Buying Some Corn—Notes.

New York, February 28, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

CANNED Foods Week—Chief interest in canned foods as the month of February draws to a close centers in plans for the National Canned Foods Week Campaign, which gets under way March 1, continuing until the 8th of the month. Wholesale grocers, retail grocers and chain-store organizations have made ambitious plans for glorifying canned foods—and, incidentally, increasing sales—during this campaign, and it is believed that the movement will attain record-breaking success in New York this year, particularly so in view of the fact that recent storms have given us real "canned foods weather." Banners and campaign signs have been copiously distributed this season, and are to be seen in the offices of practically all of the brokers, besides being shown in the offices of wholesale grocers and on their trucks and delivery wagons.

Market Strong—Buying has been stimulated somewhat by the several snowstorms which we have had during the past week, and jobbers report that the movement into retail channels has picked up. The increased buying has not been anything exceptional, however, and dealers are still refraining from buying heavy stocks. Despite this buying idea, however, the market is in a strong statistical position, and strengthening still further in first hands day by day as holdings become more depleted.

Tomatoes Strong—Spot tomatoes are a thing of the past in all of the producing sections save the Tri-States and Utah, it is reported. The Utah tomatoes, because of the freight rate, are not a factor in competing with the Eastern pack, and Maryland and Delaware canners consequently are bullish on the market, anticipating a continuance of the present strong market, with probable price advances, before new pack becomes available. Chain stores have succeeded in keeping standard 2s around 10c per can at retail, and there is a good movement through this cannel.

Maryland and Delaware canners continue to book business on the basis of prices reported last week, and quite a good volume is being done, it is said. In view of the fact that the Tri-States tomatoes are 15c a dozen under the future prices named by other tomato-canning sections, it is not surprising that the buyers are booking early business.

Future Spinach—The feature of the California canned vegetable market has been the opening on canned spinach. Several of the canners have named prices for April and May shipment, Libby, McNeill & Libby quoting on the following basis: No. 1 tins, $1.05; 2s, $1.20; 2½s, $1.50; 10s, $4.85. The California Packing Corporation is quoting 1s at $1.10, 2s at $1.30, 2½s at $1.50, and 10s at $5.00, all prices f. o. b. cannery. Recent rains have improved the spinach crop, but canners are rather pessimistic regarding the size of this year's pack, owing to crop damage during the prolonged dry spell.

Peas Well Sold—Most of the larger Wisconsin pea canners are now entirely withdrawn from the market, being fully booked up on their expected pack. The volume of business reaching them after the settlement, or rather adjustment, of the swells controversy at the Buffalo convention cleaned up remaining offering. A canner might be found here and there with a small quantity to offer, but it is no longer possible to buy a line.

Southern Peas—As a result of the strong pea market in the West, renewed buying interest has been shown in offerings of Maryland and Delaware peas, and the Southern canners have booked a good volume. Prices are working up on spot peas.

Succotash Scarce—There has been quite a flurry in fancy succotash in the New York market during the past week, the demand and short supply sending the market over the $2 mark.

Salmon Neglected—Buying of canned salmon in anticipation of the Lenten demand has not materialized to the extent expected, and the market is quiet. Seattle quotes pinks for shipment at $1.25, but this figure is not attractive to local distributors when they can buy on spot at $1.32½. Other grades of salmon are also quiet, although Chinooks of fancy quality, owing to their scarcity, are strongly maintained.

Some Corn Buying—The cleanup of cannery holdings of standard corn in the Mid-West has strengthened the situation materially, and Southern packeds are now holding on a firm basis. The low price made on future standards has held back buying somewhat, buyers gaining the impression that the spot market is "pegged" at its present level. Fancy corn is not available in a large way, and is exceptionally firm.

Fruits Sell Better—Some increase in the demand for California canned fruits has been noted during the week, the storms keeping down receipts of fresh fruits somewhat. The strength of the market is obvious, however, and holders, both here and on the Coast, are showing firm views on the situation. Pineapple has weakened somewhat, however.

Personal Trade Items—E. C. Margileth, of the National Fruit Products Co., of Washington, D. C., gallon apple packers, is visiting the market.

Van Camp Sea Food Co., Inc., of Los Angeles, report net profits of $302,675 on their sales of $2,061,322 for 1923.

R. C. Rhodes has resigned as manager of the canned foods department of V. A. Seggerman, Inc.

C. S. Stevens, well-known canner, of Cedarville, N. J., and president of the Tri-State Canners' Association, is on a trip to Florida, following recent illness.

CHICAGO MARKET

Retailers Stocked for the Week, Buying Slows Down—Wholesalers and All Interests Keen for the Week—Lowest Prices on Canned Foods Not Looked For—Salmon in Good Demand.

Chicago, February 28, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

THE Market—The market is rather quiet as a reaction from the active demand for canned foods supplies for next week, which is Canned Foods Week, as retail grocers all throughout the Central West have been freely ordering to assort their stocks in preparation for the big selling event.

Business from that source has now been shipped, and buying from that source is practically over, until week after next. City retailers will, however, be buying this week and nearly every day next week in order to meet the demand.

Our wholesale grocers are taking hold of the Canned Foods Week proposition thoroughly, and the distribution of banners, streamers and other advertising matter has been very large. I understand that all the chain stores in Chicago are co-operating fully.

Walter A. Frost is in charge of the distribution of the literature to dealers here through the wholesale grocers, and has been very active and loyal in the matter. He has been invited by The Daily News, of Chicago, our great afternoon paper, to broadcast an address as to canned foods and Canned Foods Week, Saturday evening, March 1, over NWQA Station, which is owned and operated by that paper, and will do so.

Salmon—Canned salmon is selling well in response to the demand incident to the beginning of Lent, March 5th, 1924, and some attractive prices are being made by salmon owners on the Pacific Coast, especially for halves Red Alaska, of which there seems to be some overstock in first hands. The regular quotation on Alaska halves flat is $1.50, but that price has been shaded a few cents. I understand that a good line of carload shipments are now in transit from the Pacific Coast to Chicago, but that they are mostly all assorted as to kinds and sizes of salmon.

The price of evaporated milk has been very low, and wholesalers have been buying it pretty freely, but the price on non-advertised brands has advanced in the past few days, and is now named as $4.15 per case for 48-lb. cans, f. o. b. Chicago, and other sizes at a proportionate price. The cold weather, of course, necessitates the full feeding of cattle and makes milk cost more to produce.

The wholesale buyers of canned foods seem to have about become convinced that the prices for canned foods, both for prompt and future delivery, are so low as they are likely to be, and this is proven by the fact that far more contracts for future canned foods have been entered into by wholesale grocers than at this time last year, and that wholesale buyers are friendly to canned foods futures instead of decidedly unfriendly as they were last year.

There is going to be a rather serious development in the matter of canned foods for immediate use soon. Canned Foods Week will be widely observed throughout the United States, and an enormous quantity of canned foods will be sold in that period.

This special selling period and effort will still further heavily reduce the already inadequate supply of canned foods in the hands of the retail grocers, and they will be compelled to replenish their stocks promptly. This replacement will cause a clean up of the staples in canned vegetables, closer than there has been for many years, for stocks now are very low.

American sardines are not selling from the fact that prices are very high and canners of the article have been indifferent sellers even at the high prices, they having very little stock.

The laws permit the beginning of catching and canning of American sardines on the Atlantic Coast to begin April 15, but the weather seldom allows fishing conditions until several weeks after that time. The stocks of domestic sardines at present are very small in first hands, and there are no stocks scarcely in second hands.

CALIFORNIA MARKET

Orchards in Blossom—Springlike Weather Helping Everything—Growers Urged Not to Plant Crops Which Require Irrigation—Canners' League in Session—Their Program—Market Quiet, but Showing Increasing Firmness—Opening Prices in Spinach.

San Francisco, February 28, 1924.

Special Correspondent "The Canning Trade."
By "Berkeley,"

ORCHARDS in Blossom—Warm spinrg weather is prevailing throughout California, almond orchards are in blossom, and it will be but a short time until peach and apricot trees are in bloom. Early strawberries are in the market, and how vividly they remind one of straw. Newcomers from the Middle West are treating themselves to a diet of sulphur and molasses, and there are other signs that winter has come to an end. So far there really has been no winter here, barring a few cool days the first of the year and a few light showers. Week after week the weather man has chalked a long series of goose eggs opposite the list of California weather stations, a performance which may despair to many growers. In the southern part of the Sta have delighted visitors to the State, but one which has brough growers have been advised repeatedly not to plant crops whic require irrigation, and the use of water is being curtailed i every manner possible. In the northern section the situatio is not quite so acute, but is still very grave. The outlook fo crops in general is anything but promising, with spring in evi dence.

Convention—The annual convention of the Canners' League of California is to be held at the Hotel Del Monte, Del Monte Cal., February 28 and 29, and March 1. The tentative program has been announced, and is quite a complete one. The first session will be held on Thursday evening and will be marked by an opening address by President Elmer E. Chase, a talk by F. E. Booth on the work of the League during the past year, and the reports of the auditing committee, the nominating committee and R. Bellingall, the treasurer. The Green Fruit Section will then go into session, with Elmer E. Chase presiding. Suggested topics for discussion are: "The Crop Outlook for 1924," "Fruit Cost Outlook for 1924," "The New Fruit Sizes," "Late Irrigation," "Canners' League Handling of Fruit in Sutter County" and "Status of Industrial Welfare Commission." Discussions will be led by F. L. Monnet, G. H. Bradt, F. E. Laney, L. E. Wood, Louis Wetmore, W. E. Thomas, Alan Richardson, F. A. Dixon and Preston McKinney.

The first subject on the program for Friday morning will be "A Cutting Bee," with F. A. Wilder presiding. Several hundred samples, representing the pack of almost all the members of the League, will be on display, and in addition there will be samples of fruit packed in South America and Australia. Printed forms will be available for scoring and for comment, and at the conclusion of the inspection Dr. A. W. Bitting will give a talk on processing for color.

Following this the Canned Fruit Section will go into session, with R. M. Barthold acting as chairman. The subjects to be discussed will include "The Market Situation," "Handling of Swells," "Present Status of Our Fruit Standards," "Canned Figs," "Fruit Salad" and "Cost Accounting," with discussions led by W. A. Gellersen, G. H. Bradt, G. N. Herbert, Elmer E. Chase, G. N. Edwards, E. S. Morehead, J. C. Ainsley and A. M. Lester. In the afternoon there will be a general session, with talks by Royal F. Clark, President of the National Canners' Association; Frank E. Gorrell, Secretary of the National Canners' Association, and Mrs. Katherine Philips Edson, of the California Industrial Welfare Commission. At the conclusion of this session there will be a meeting of the Spinach Section, with Leslie S. Smith presiding. Prof. E. J. Lea, of the University of California, and Preston McKinney, secretary of the Canners' League, will speak on "Plans for Spinach Processing and Inspection for the New Season," and talks will be followed by discussions on the crop outlook and on combatting pests. The discussions will be led by L. E. Wood, Leslie S. Smith, R. Bellingall, C. E. Hume and D. L. Smith. The annual banquet will be held in the evening.

Saturday morning the Raw Products Section will go into session, under the leadership of F. L. Monnet. F. A. Dixon will make a report on "New Varieties of Peaches" and will display canned samples of promising new varieties. B. A. Rudolph, of the University of California, will talk on "Apricot Brown Rot Fungus," and there will be discussions on "Spinach Diseases and Pests," "Tomato Diseases and Pests" and "Asparagus Diseases and Pests." The Tomato Section will also hold a meeting in the morning, with W. St. B. Eustis, chairman. Discussions will be led by E. H. Duncan, H. T. Pyle, G. N. Edwards and V. V. Greco.

The afternoon will be given over to a golf tournament, in which many entries have been filed.

The Market—The spot market situation continues about as it has been for several weeks, with the tendency toward stiffer prices. Stocks are cleaning up well, and the outlook is none too promising for the 1924 crop, which is tending to stimulate the interest of buyers. There is an especially good demand for cling peaches, with holdings of these rapidly getting down to small compass.

Spinach—Opening prices on California spinach for April and May delivery have been madee by Libby, McNeill & Libby, these being slightly below those of last year. These are: No. 1, $1.05; No. 2, $1.20; No. 2½, $1.50, and No. 10, $4.85. A heavy pack this year seems out of the question, owing to the drought, and it is expected that a marked demand for spinach at these prices will soon be in evidence.

Asparagus—The Warmington-Duff Co. is quoting tentative opening prices on canned asparagus, these averaging about ten cents a dozen less than the prices recently put out by the California Packing Corporation, figured on the No. 2½ size. A strong demand has materialized for this vegetable, and many

interests have already booked about all the early business they care for. Fresh asparagus is in the market, but it will be several weeks before canning is on in earnest.

Peas—Far Western canned peas have seldom been sold in the Eastern markets, but Utah pack has been sold this season for delivery in New York. While the packing season is well in the future, many interests are virtually sold up and buyers seem to be still unsatisfied.

Coast Notes—Paul Findlay, merchandiser for a San Francisco advertising agency, plans to attend the convention of the Associated Advertising Clubs of the World, to be held at London, England, in July. Following the convention he will spend two months in England and France studying the market possibilities for California products.

The organization of the California peach and fig growers along lines similar to those upon which the Sun-Maid raisin growers are now operating is being considered. New crop contracts are also proposed.

The co-operative advertising campaign of the canners of Hawaiian pineapple will include both sliced and crushed pineapple this year. The demand is now well balanced, with no surplus of either.

MAINE MARKET

Market Showing Improvement—Clam Canning May Begin This Week—Market Bare of Clams—Sardine Canners Making Ready—Future Corn Is Selling Freely—The Quality of Corn Is to Be Improved.

Portland, Me., February 29, 1924.

By "Maine,"

Special Correspondent "The Canning Trade."

MARKET Improving—General trade in this market has shown improvement during the past fornight. Spot stocks are clearing up, and the buying has increased. We have had an exceptionally kind winter—although the thermometer has run lower and held down longer than usual, the sun has been almost constantly with us, the snow fall light, and the traveling good during the entire season. This is expected to result in an early opening of spring business.

The first item in the Maine canned foods calendar is clams, and work in this line will doubtless begin in the first week or so of March unless very unclement weather comes upon us. The market is bare and new goods needed. It is hoped that the spring up-put will be more profitable than the fall pack, as the spring clams usually measure up a little better—that is, more cans to the bushel than the fall "fruit." New clams have already been offered for sale at $1.30 and $1.95, and shipping will begin as soon as the pack starts in order to meet the present demand. The 5-oz. size is the popular package, and, as a rule, the 8-oz. is put up only on order.

The sardine canners are also looking ahead to the opening of their spring season, and are running in rather better luck than last year. The lateness of the spring and the damage from ice last season was a handicap from which they did not recover; but now there is very little harbor ice and every prospect of an early spring. No prices will be named on sardines until more definite plans for the work can be formulated and costs estimated. Spot stocks move slowly, but do move, and will be cleaned up before the advent of new goods in the market. The outlook this season is encouraging, with a bare market, promising weather, and the experience of the past few years to guide the canners and govern their pack.

Future corn continues to sell freely, and the prices to remain firm. Crosby corn at $1.45 is having its usual demand, this variety being the standard pack of Maine. Golden Bantam is increasing its popularity even over last year, and is being welcomed in the market at the $1.70 price announced. It seems to be a fact that these prices are well adhered to, despite the intangible rumors of less money. One small canner is known to have made early offerings at lower figures, and has now revised his prices; but the story still echoes and re-echoes in the markets—it reminds me of the man who did right a thousand times and heard nothing, but did wrong once and heard from it a thousand times. Prices are firm, and each individual canner seems anxious now to get full money for his goods.

There is decided movement on foot to improve the general quality of corn, principally based upon overcoming adverse weather conditions and being prepared for emergencies. Much new machinery has been installed this season, latest methods adopted, and every possible means provided to make a greater ratio of Maine corn come up to the very fancy quality for which the State is known.

Stringless beans are also selling well, at $1.30 and $6.00 for 2s and 10s. The demand for this larger package business increases each year. Canners report a wider distribution than ever, selling in markets which have hitherto been unfruitful on Maine beans. The acreage has been increased to take care of this growth and new equipment added at the factories.

TENNESSEE CANNERS MEET.

THE Tennessee Canners Association (it was formerly called Tennessee Tomato Canners Association) held its annual meeting at the Atkin Hotel, Knoxville, Tenn., Thursday, February 7th, 1924. The business meeting was held at 3.30 P. M., and in the evening the canners were the guests of the machinery and supply men at a banquet given at the same hotel Over 100 places were occupied.

The same officers and executive committees were re-elected. J. W. Gillaspie, Columbia, Tenn., President; E. A. Davis, Morristown, Tenn., Vice-President; L. N. Rodgers, Dayton, Secretary-Treasurer.

The time and place for the next meeting was not decided on, but will be named at the next meeting of the Excutive Committee.

Several canners applied for membership, which will make the Association practically 100 per cent strong in the state, and all look for a very successful year for the Association.

FUTURE TOMATOES IN VIRGINIA.

February 8, 1924.

Always at this season of the year rumors are flying fast regarding the price of future canned foods. We hear that a brother canner has confirmed sales at this and that price, when, as a matter of fact, he may not have sold at all. When we are taken in by this propaganda, and feel that we must sell at the figure, then there becomes a definite basis from which the propagandists may work and the market become set at what may not be profitable.

We are writing for the interest of the trade in general, though when you are informed that our pack averages 50,000 cases annually you will also see a selfish motive in our addressing you, for a drop of just 5 cents a dozen means a loss of $5,000 to us.

It is to our interest and yours that a price with a profit be maintained. We would not presume to suggest that price to you, as it would be in violation of the law, nor could any agreement be gone into without danger of running afoul of statutes against combinations in restraint of trade.

But on the face of it you nor we can afford to confirm business at last year's opening price, regardless of what our brother canners may be doing. The market breakers will soon be sold up, and those who have considered costs may then obtain a figure which will at least let them stay in business. We know that cans are costing approximately 6 cents and 7 cents more per case than last season. Many sections are paying more for raw stock. It cannot be hoped that labor costs will be lower, but expected to command a premium. Labels are quoted by some lithographers as higher, cases advanced and all new machinery for canning will cost more.

Having taken all these things in consideration, we do not believe No. 3 tomatoes can be profitably manufactured for less than $1.30, nor No. 2's for less than

90c., and in some sections, doubtless, this price is too low to admit of a satisfactory margin.

Because we may have been misquoted, we are advising that our price remains at 90c. and $1.30 for standard goods, for even with our overhead largely absorbed by the size of our pack, these prices show a margin only sufficient to return a very small percentage on our investment. Let us have your views. Yours very truly, L. B. WILLIAMSON.

THE NEW PLANT OF THE METAL PACKAGE CORPORATION OF NEW YORK.

An enterprising move on the part of the Metal Package Corporation of New York, has just been announced from the Executive Offices, 110 E. 42nd St., New York City.

This involves the establishment of a major factory unit at Grand and Garrison Sts., Maspeth, New York City, and the removal of the factory heretofore known as Shalita Brothers, located at 264 South St., New York City, and is in addition to the extensive plant facilities long maintained at Brooklyn and Baltimore.

The newly acquired factory building, which makes available more than 100,000 square feet of floor space and machinery equipment of the most advanced type, was formally opened on January 14th, being dedicated to the plain and decorated package requirements, and several more specialized containers and products with a special reference to trade arising within the Metropolitan district.

This installation includes new equipment to strengthen the production of several lines of containers for food products, tea, coffee and spices, the demand for which has rapidly overtaken facilities from this organization at other plants.

From point of location, this unit will be admirably adapted to clearing its output by rail, water routes and motor trucks to patrons located in Manhattan, Brooklyn, Long Island and New Jersey, and outlying districts. A ten-car railway siding enters the factory grounds, accessable docking facilities are within 800 yards distance and there are many motor truck routes leading into Manhattan, twenty minutes from the bridge thoroughfares.

The Foundation of A GOOD LABEL

The design may be beautiful and the inks of the best quality but if the paper isn't right the label will not be right.

A good label must have a good foundation---fine paper. It must be paper that will stay white with age and it must be the right finish for color printing purposes. Also it must have the strength and texture to give maximum production on labeling machines.

We test every lot of paper we receive to make sure that it fulfills all these requirements. We use nothing but the best quality of coated and uncoated papers made for us on our order and always by the same formula.

On this foundation we build---with the taste and skill of long experience---labels that help sell goods.

SMILE AWHILE

DOES CONSTANT ADVERTISING PAY?

The Answer—The Wrigley Chewing Gum Co. will spen $6,000,000 for advertising in the year 1924.

Problem—How much will the Etiquette Books have to la out to neutralize the Wrigley campaign?

SHOULD BE ASHAMED

A sailor on leave was strolling in the country, when he sa for the first time in his life two men working on a cross-cut saw He stood for about a quarter of an hour watching the two me one of whom was very tall, while the other was short. At las he made a sudden spring and dealt the taller man a blow in th face.

"What—what's this?" stammered the big man.

"You big coward!" cried the sailor. "I've been watching yo for the last quarter of an hour trying to take that saw from th little fellow!"

TRAPPED, BY HECK!

The tourist had stopped in a small rural village. He wa preparing to resume his journey when he noticed the town con stable watching him narrowly.

"What's the speed limit here?" he asked, thinking it wise t be prepared.

"Never ye mind, young fellow," replied the rustic cop. "Jes yew try t' git out o' this town without bein' arrested."

LUGGAGE WAS WISE

Scene—Highland Junction.

Londoner—Portah! Portah! Where is my luggage?

Porter—Aye, mon, yer luggage has mair sense than yersel' Ye're in the wrang train!

THAT'S A RECOMMENDATION

"De bes' thing 'bout this gun, Misto Johnsing, am de fac dat it am pos-o-toot-ly inwisible," declared the dusky salesma of firearms.

"Is yo' sure o' dat?" asked the prospective purchaser.

"Is I! Why, man, night befo' las', comin' home fum de Stevedores' Ball, a big, mean-lookin' man hel' me up. An' Al had dis gun pointin' right at him all de time he was goin' thoo mah clothes, an' he nevah even seen it."

Farmer—There's my prize dog. Don't you think he ought to make a fine picture at the show?

Visitor—Well, if he's a good pen artist he may.

LEAP-YEAR YARNS

She—Just one kiss, please.

He—No, I'm not that kind, and if you don't stop pestering me I'll scream.

"SEEING IS BELIEVING"

Professor's Son (to visiting prominent Alumnus) — Please, Mister, here's a glass of water for you."

"Thank you, my little man! It was very thoughtful of you; but I really don't care for a drink now."

"Oh, please drink it anyway!"

"Why, little man, are you so anxious to have me drink it? Is there something in it?"

"No, sir: it's perfectly good water; I want to watch you drink. Mama says you drink like a fish!"—Flamingo.

SAFETY FIRST

"At last we have an honest bootlegger."

"How so?"

"He prints an antidote on the label."—Medley.

SUCH CARELESSNESS

Tourist—So you were the guide of the man who jumped off this cliff last week. Why did he do it?

Guide—I don't know. I forgot to ask him before he jumped, and afterward it was too late.—Boston Transcript.

EDITORIALS

I WOULD THERE WERE MORE OF THEM— That "peppy" little house-organ, The Optimist, representing the Campbell Soup Co., of which V. S. Wheeler, assistant to President Dorrance, is the ditor, expresses a sentiment in its March number vhich we heartily echo. It is a tribute to Senator Bert" M. Fernald, once president of the National Canners' Association, always a canner of good corn and ther products, and for many years senator from Maine, but most of all distinguished because he is a usiness man in the Senate. For years business men ave been more or less disgusted with affairs at Washngton, and possibly never more so than today; but vhatelse could have been expected when we turn "the reatest business on earth," as our Government has een rightfully termed, over to such a gathering of men s now represent us in both the House and the Senate. Politics and the country be damned" would not be the notto at Washington if we had business men representing us instead of second class lawyers and worse. As editor Wheeler intimates Senator Fernald stands ut above his fellow legislators like a towering oak; he akes his job seriously; knows and realizes what is best nd most needed for the progress of this great nation, nd does not give a "hang' for his political fences if hey run counter to the greatest good for the greatest number.

There will be those narrow minded enough to hint hat the trade journal is not the place for politics; but f there is anything more needed to the safety and permanency of all business than a change in our method of electing our representatives—a change from the cheap-rate politician to the business man of well-known ability—we know not what it could be. We are in the grasp of the politician and we must get out, for so long as the politician rules few good business men will waste their time and energy in attempting to serve the people. If we business men would but give the affairs of our country the consideration we owe them, we would not only be doing our mere duty but we would be safeguarding all business, ours included. We would then see that there were more Fernalds among our law makers. That task should be accomplished by this Fall.

We quote the article in question:

A Business Man in the Senate

"The farmer, the grocer and the canner have a loyal and understanding champion in Senator Bert M. Fernald, of Maine. A successful farmer and canner, Senator Fernald is a business man of ability and experience—one of the few in the Senate. And he regards legislation from the point of view of a business man rather than from that of a lawyer.

"As a canner of Maine sweet corn, he has introduced his product throughout the world. Maine canned corn does not owe its enviable prestige so much to the favoring influences of soil and climate as to the successful preservation of the delicate flavors of fresh corn achieved by Senator Fernald and other leaders of the industry in that state, and to the admirable standards of quality and cleanliness which they have established.

"Not only has he built up an important business for himself, but he has largely aided in the development of a great industry, an industry that supplies a stable market for the product of Maine farms and adds greatly to the prosperity of the farmers and of the whole community.

"During his term as president of the National Canners Association he originated the scientific research work of that organization and did much to increase its strength and prestige as well as to promote constructive publicity.

"He has had broad experience in public affairs, serving one term as representative in the State Legislature and two terms as State Senator. He was governor of Maine in 1909-10 and has represented that State in the Senate since 1916.

"He is connected, either as chairman or member, with various important Senate committees, and is very active on the Interstate

Commerce Committee, for which his business training has admirably fitted him. He is well equipped to deal with all commercial questions and, as a matter of fact, would make a great Secretary of Commerce.

"Mr. Fernald is the first Senator to reach the office building in the morning and among the last to leave it at night. He is so conscientious in keeping abreast of his work that he is known as 'The Senator with the Clean Desk.'

"His first-hand knowledge of the food industry has made him the chosen spokesman and representative of all its branches.

"His influence may always be counted on in favor of things constructive, sound, wholesome and conservative; and he is the sleepless foe of dirt and slackness and graft in business—public or private.

"Mr. Fernald is a representative of the very best type of New England business man, and it would be a great thing if there were more men of his stamp in public life."

NOT LIKELY TO BE ENFORCED—"The Nation's Business" in its March issue, speaking of the decision by Attorney General Daugherty, on the matter of trade associations, says:

> Reactions by the trade press to the recent Hoover-Daugherty correspondence with regard to collection and distribution of statistics by trade associations are remarkably unified, and in general manifest themselves in a frankly expressed belief that Mr. Daugherty's reply is merely an opinion, with no "thou shalt not" quality, expressed or implied, or that, granted Mr. Daugherty wished to enforce this opinion as a ruling, the courts most certainly would sustian the trade association's right to gather and disseminate information.

All men know that Secretary Hoover is a business man and has done everything in his power to remove the shackles from business—put there by the politicians. That old bromide "competition is the life of trade," has been shown up as the reverse of the truth more often than not, and that in truth, co-operation, rightly controlled, is the life of trade. The Sherman law which aimed to stiffle rtade through the prohibition of essential statistics and co-operation within lines of industry, had to be thrown on the scrap heap in time of war, when the Government needed the maximum in business efficiency; and if it was impossible during war it is equally impossible during peace, if trade is to reach its maximum. It should be modified to permit co-operation along legitimate lines, and Secretary Hoover knows this and has worked to that end.

Not a few of our Associations have been worried over this reported ruling of the famous Mr. Daugherty and we are glad to note that popular opinion, and Mr. Hoover, are not in sympathy with him. This being so industry will, in all probability, not be molested in the pursuit of those proper statistics necessary to the rightful conduct of any business. Associations have progressed, just as individuals have progressed, and they have sought to act as collectors, and distributors, of those vital statistics upon which their businesses entirely depend; which means operating in the light of knowledge instead of guessing and gambling, and it is to be hoped that in this enlightened day we will not see our Government acting like a blind despot, and no one believes it will. Mr. Daugherty's opinion will not be sustanied, and the Associations may go on with the work, so long as it is honest and above board, and tha is all that is asked.

WHAT OF THE BIG COMBINATIONS?—Fo the past couple of years the air has been pret constantly filled with rumors of combinations c canners in Baltimore City, down on the 'Shore, an elsewhere. What of them? It is now said that th first big movement of this kind has died-aborning Whether it has or not we do not know; we merely re peat, it is said so. And in its wake comes other re ports: that the Duponts, of powder fame, down in De aware, will corner all the tomato, and other canners, c that little State and probably others, etc., etc. And th usual suffix follows mention of this name, to the effec that what the Duponts attempt they usually perform as they have the money. Possibly so; but it has bee our observation that the Duponts are usually pret certain where the dividends are coming from befor they spend that well known money, and heretofore hav been too wiley investors to be caught in a plan of co operative tomato canners, because they know full wel that as quickly as one tomato canner is bought out another, if not the same one, will open up across th street. Picking up quick-silver with your fingers is a easy task compared to buying up tomato canneries with a view to cornering that industry. We will b surprised if the Duponts attempt anything of the kind

"FIDDLING WHILE ROME BURNS."

A Fair Sample of What Has Brought Maryland's Onc Famous Oyster Business to Grief—Action, Not Talk, Needed to Restore the Oyster Business.

Elsewhere we republish a report from Conserva tion Commissioner Vickers, which seems to show th Chesapeake Bay oyster business to be in quite fair con dition. Everybody else knows that it is not. Her is a letter from one who might be said to be "on th ground," and besides displaying the real condition, h gives a good sample of what may be expected from our lawmakers.

What has killed the oyster business? Politics!

We take this from the letter columns of The Sun of March 4th, 1924:

An Oyster Firm on Sinepuxent Bay Hopes the Chesapeake Oys termen Will Profit by the Sad Experience of the Former.

To the Editor of The Sun—Sir: An interesting indulgence in oyster propaganda now holds forth in your columns. A worthy (let us assume) statesman, Spence by name, asserts tha "half the talk about oysters being so scarce amounts to nothing When the price goes high enough oysters are always on hand."

The logic of it: In 1885 oysters were worth 25 cents pe bushel and retailed for 15 cents a quart. The production tha year ran up to and over 15,000,000 bushels. The present season has witnessed the highest prices ever paid in Maryland—as much as $1.50 a bushel, or six times the 1885 price. From competent authorities it is learned that Maryland will barely produce 3,000,000 bushels of oysters this year. The correlation between high prices and output is self-evident. Prices sixfold find production less than one-fifth. What does this mean?

W. T. Todd, of Chance, who states that Maryland hasn't a dependable oyster bed for seed production, contrasts it with "beds in the Delaware Bay that will last for 1,000 years." What an opportunity for travel! If there are finer seed beds than Tan Bay and the many river seed areas, I have never seen them, except possibly in the James River. The celebrated Whitstable in England and the Marennes in France pale into insignificance when compared. In our oyster planting business here in Worcester we have procured seed all the way from New York to the

The Most Recent Studies In Processing

Times and temperatures for Pumpkin—Beets—Tomatoes

By Dr. W. D. Bigelow

Chief, Research Laboratory—National Canners Association

The following results of recent experiments and study were given in addresses at the Buffalo Convention, but not recorded in our report, by request of Dr. Bigelow. They have been furnished direct, now, and will be found very important, and worth careful keeping.

THE PROCESSING OF PUMPKIN.

IN processing pumpkin there is a general tendency to give a relatively longer cook to small cans than to those of larger size. The heat penetration of pumpkin is very slow, and a relatively long cook is therefore required for the larger sized cans as compared with that necessary to sterilize pumpkin in the smaller cans. On this account pumpkin in No. 10 cans that is given a process with sterilizing efficiency approximately equal to that ordinarily given to No. 2 and 3 cans will be probably darker in color.

In order to overcome this condition some canners have reduced the temperature of their cook, not realizing that by so doing they have also greatly decreased the sterilizing efficiency. I give below in tabular form processes for pumpkin believed to be of substantially equivalent sterilizing value cooked at different temperatures and in cans of different sizes.

Can Number.	Process time at retort temperature of 235 degrees Minutes	240 degrees Minutes	250 degrees Minutes
1	70	60	45
2	85	70	55
2½	105	90	70

PROCESSING TOMATOES.

IN processing tomatoes the product is disintegrated more or less, and the amount of disintegration increases with the length of the process. The disintegration is greater in some seasons than in others; sometimes the tomatoes are cooked to pieces and the juice liberated to such an extent that there is a tendency to reduce the length of the process to such an extent that sterilization is not complete, and spoilage results. This occurs with all methods of sterilization.

The spoilage of tomatoes also often results from the use of home-made sterilizing devices. This is probably applicable to tomatoes to a greater extent than to any other product. Home-made devices frequently are not heated in all portions to as high a temperature as is counted on by the processor. There is also sometimes a tendency to overtax the capacity of rotating cookers, thus reducing the length of the process to such an extent that a considerable percentage of the product is not sterilized.

For all of these reasons, and probably for others, the amount of spoilage in canned tomatoes is higher than it should be. Many canners attach undue impor ance to the appearance of the product, and in attemp ing to avoid disintegration of the product and the f mation of free liquor go to the other extreme and e perience spoilage from under-processing.

The only way in which this can be avoided is bear in mind that the process is primarily intended f the purpose of sterilization, and that that end must secured at whatever sacrifice in the appearance of t product may be necessary. It is frequently fou that the procedure can be so modified as to conser the appearance of the product without decreasing t cook. The disintegration of tomatoes in processi is often due in large part to stacking them in the wa house while still hot, and in such a way that they r tain their heat. Many canners prefer to air-cool the tomatoes, but where this is done it is important th they be stacked in such a way as to afford ample ven lation and permit the prompt cooling of the cans.

Sometime ago the Research Laboratory inaug rated a study of the bacteria that causes the spoila of tomatoes, from which it was hoped to obtain fund mental information regarding this question similar that which we have secured regarding processing certain vegetables. It was hoped this work might ha reached such a stage that some announcement of t results might be made at this time. This is not t case, but the results obtained are of considerable i terest, and warrant the statement that when the wo is completed we will be able to understand the pr cessing of tomatoes in the same way that we now the processing of corn and peas. It is hoped th some further statement regarding this matter may made before the beginning of the coming canning se son.

At present our ideas regarding the processing tomatoes are drawn largely from our observations commercial canning plants. Our present ideas of t process that should be given tomatoes are given the tabular statement below.

PROCESSING OF BEETS.

IN processing beets it is important that the time and temperature employed be such as to insure sterilization, and that the process be conducted in such a way as to conserve the color. There are probably few products processed under more varying conditions than beets. This product is peculiar in that it does not appear to be an acceptable food for many varieties of bacteria. There do not appear to be many spore-bearing bacteria that will grow in beets. On this account beets that are given a relatively short process in boiling water are often sterile, and the boiling water process for beets has been largely used in the industry.

There are some spore-bearing bacteria, however, that grow in beets when they are present, and this fact probably explains the occasional spoilage of beets processed in boiling water which has been experienced in the industry. It is now definitely known that beets should always be processed under pressure. In order that this may be done and the color still conserved, it is essential that the retorts be so arranged as to permit prompt cooling. Of course, with the smaller sizes of cans processed in small retorts, the retorts may be opened quickly and the canned product immediately subjected to cooling. With the larger sizes of cans it is essential that the retorts be piped for rapid cooling under pressure.

I give below in tabular form the processes now suggested for beets. Of course, if the product is not cooled promptly after processing these cooks result in much damage to the color. If the cooling be prompt, however, a satisfactory color may be conserved. The sterilizing value of the cooks given in this tabular statement is far greater than that of any cook in boiling water that has ever been used. These cooks are all equivalent to cooks of more than six hours in boiling water. The latter would, of course, totally disintegrate the beets and entirely destroy the color. With beets, as with many other products, it is found that a high process temperature does not disintegrate the product or destroy the color nearly as much as a process at a lower temperature for an equivalent sterilizing time. To make an adequate comparison, however, of cooks of different temperatures we must bear in mind the relative sterilizing value of these temperatures for a given time. Frequently when such comparisons are made this factor is not kept in mind, and the increased time given products processed with a lower temperature does not merely compensate for the difference in temperature.

Bearing this difference in mind, it is believed that a temperature of 240 degrees should be used for processing beets under all circumstances. Some difficulty has been experienced in applying these high temperature cooks to sliced beets, especially in small containers, because the slices fit together so closely as to impede the distribution of heat between them. It is suggested, therefore, that until this matter receives further study sliced beets should be processed at least 20 per cent longer than whole beets.

CANNING ITEMS, NEWS AND NOTES

Eau Claire, Wis.—Frank King expects to "put u considerable stuff" this summer, and is interested all things pertaining to the business. P. O. Box 222

Marion, Va.—County Agent Lee M. Cole, Jr., say that one of the farmers in his district is interested establishing a cannery, and will let us know.

Florence, S. C.—J. N. McBride, Assistant Gener Development Agent, Seaboard Air Line, writes:

> "How much money, outside of buildings and site, would be required to put up a modern canning plant of sufficient size and capacity to can from 5,000 to 10,000 tons of tomatoes, 2,000 to 3,000 tons of beans, 2,000 tons of peas? How much liquid capital would be required in addition to operate such a plant!"

The idea is to establish a number of canneri along their lines.

Victor, N. Y.—W. H. Osborn, Honeoye Falls, N.Y R. O. Whitney, Ontario Centre, N. Y., and R. W Smith, of Rochester, have purchased the Victor Pr serving Co. plant, and have incorporated for $75,0(under the name of the Victor Canning Co., incorp rated. They will pack a full line of fruits and veg tables.

Napton, Mo.—A. H. Miller writes he desires t open a canning factory and wants all information, ca alogues, etc.

Corpus Christi, Texas—Lone Star Fish and Oy ter Co. say: "Will shortly start construction of shrimp cannery."

Danesboro, Ga.—W. B. Warthen is considering th installation of a canning factory to handle tomatoe wild berries and kraut.

Canned Cabbage Rich In Vitamins.

By E. F. Kohman

Research Laboratary National Canners Association

This is the first of a series of reports of experiments cooperatively conducted by Professor W. H. Eddy of Teachers College, Columbia University, and Dr. E. F. Kohman, Research Laboratory, National Canners Association, and reported by them in Industrial and Engineering Chemistry, Vol. 16, p. 52, 1924

THERE are statements appearing from time to time, mostly in popular literature, to the effect that canned foods largely lose their vitamin content due to the heat to which they are subjected during processing. The writer has long been convinced that these statements are fundamentally wrong. This conviction resulted from a careful scrutiny of investigations bearing on the effect of heat on the vitamins. Two things were evident as a result of such scrutiny. First, the conditions of heating to which foods were subjected for studying this question were usually not those which obtained in the can during processing, because in many cases the conditions were such that oxygen had access to the foods during heating. Where destruction of the vitamins was observed, particularly in the case of vitamins A and C, the results could be most logically explained on the basis that oxygen was the destructive factor. Second, in the few cases where canned foods themselves were studied there was evidence that the vitamins were not seriously affected. As an illustration, canned tomatoes have been studied more carefully than any other product, and no one has yet reported them to be poorer in any of the vitamins than fresh tomatoes.

A number of investigators have made a study of home cooking methods on the effect of vitamin C in cabbage. These investigations, both in this country and in England, showed that one gram of raw cabbage per day was sufficient to protect the guinea-pig from scurvy, but after cooking it required 20 grams of the same cabbage to accomplish the same result. This was true whether the cooking was done in an open kettle or in a pressure cooker. It therefore seemed an opportune time to make a study of canned cabbage on the same basis. Fortunately, we have been able to do this as indicated in the foot note.

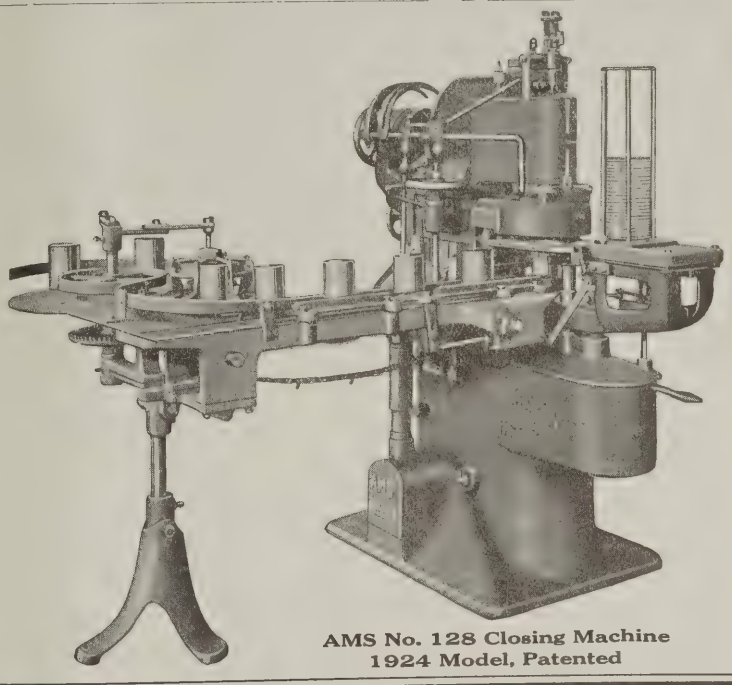
About the middle of November, 1922, an experimental pack of cabbage was put up at Geneva, N. Y. The cabbage had had two light frosts previous to harvesting, and was canned within a few days after harvesting. We know of no cabbage being canned on a commercial basis, consequently we found it necessary to devise our own method of canning. The pack we put up proved to be excellent in appearance and the contents of the can stood up well upon being emptied. The following is the method used:

Cabbage heads were cut in quarters, all the bad outer leaves stripped off and the cores cut away. Then the quarter was cut to fit into a No. 2 can. For our feeding tests it was necessary to have exactly the same known weight of raw cabbage in each can. If the quarter of the cabbage cut out as above described did not weigh exactly 11 ounces it was corrected by adding to or taking from it. With a firm head of cabbage it is possible to get considerably more into a No. 2 can. By using a wooden potato masher—a proper sized round bottle does equally as well—to press the cabbage down, considerably more can be forced into the can.

After the cabbage was packed in cans, these were filled with hot water from the factory tubs and through which live steam was passed to boil it actively for two or three minutes to drive out all oxygen. The cans were then passed through an exhaust box at a temperature of about 200 to 210 degrees F. This required four to five minutes and the cans were then sealed. The experimental pack thus prepared was divided into lots processed as follows:

Lot	Minutes Time	Degrees F. Temperature
1	30	212
2	60	212
3	15	240
4	30	240
5	45	240
6	30	260

Before going into the results of the feeding of these various lots of cabbage it may be of interest to give in some detail the procedure used in making vitamin tests on any food product. Lack of vitamins in the diet leads to deficiency diseases. The disease for each vitamin is specific. Some species of animals are more susceptible to a deficiency of one vitamin, whereas other species may be more susceptible to a deficiency of another vitamin. Consequently, a species of animal must be used which is affected in a clean cut, known manner by a lack of the particular vitamin to be studied. Inasmuch as this was to be a study of vitamin C, the guinea-pig was chosen as the test animal. Vitamin C is known as the antiscorbutic vitamin, because its absence in the diet leads to scurvy. The guinea-pig is an animal very susceptible to scurvy, and a lack of vitamin C in its diet leads to definite, well-known conditions.



The nutritional needs of animals with respect to carbohydrates, fats, proteins, and minerals is well worked out. Consequently it is possible to make a mixture of a few foodstuffs which will supply all the food requirements of the animal except the vitamins. For this experiment a mixture was used consisting of 59 per cent ground oats, 30 per cent skim milk powder, one per cent salt and 10 per cent butter fat. The butter fat supplied an abundance of vitamin A, while the oats supplied vitamin B, both of which are necessary for the guinea-pig. Skim milk powder has been

found to contain traces of vitamin C, and it was therefore subjected to a baking period of two hours at 230 degrees F, in the presence of air to free it of the last traces of this vitamin. It is known the oxidation is destructive to vitamin C, and this treatment has been found effective in freeing the skim milk of its last traces. Ground oats and butter fat are generally accepted to contain no vitamin C. On a diet consisting of this mixture a guinea-pig will die of scurvy usually within 20 days. A control lot of guinea-pigs was fed this mixture in order to show definitely that it was free from vitamin C. This proved to be the case, because the guinea-pigs all succumbed to scurvy and died within the usual period. In order to test the various lots of canned cabbage for their vitamin C content, the above diet with varying quantities of cabbage was fed daily to other lots of pigs, until the least amount that would suffice was found.

In the first test 15, 20, 30 and 40 gram amounts were fed to different lots of guinea-pigs. This soon proved to be more than was necessary. A second test was then made feeding 5, 10 and 15 gram amounts daily, and here again the guinea-pigs were protected against scurvy. In the final series p, 4 and 8 gram daily feedings were used. Two grams proved to be inadequate, as the guinea-pigs succumbed to scurvy, but the 4 gram amounts were adequate to supply them with sufficient vitamin C. This shows that the canning process used produces cabbage cooked and ready for the table with a vitamin content approximately five times as great as cabbage cooked by home methods.

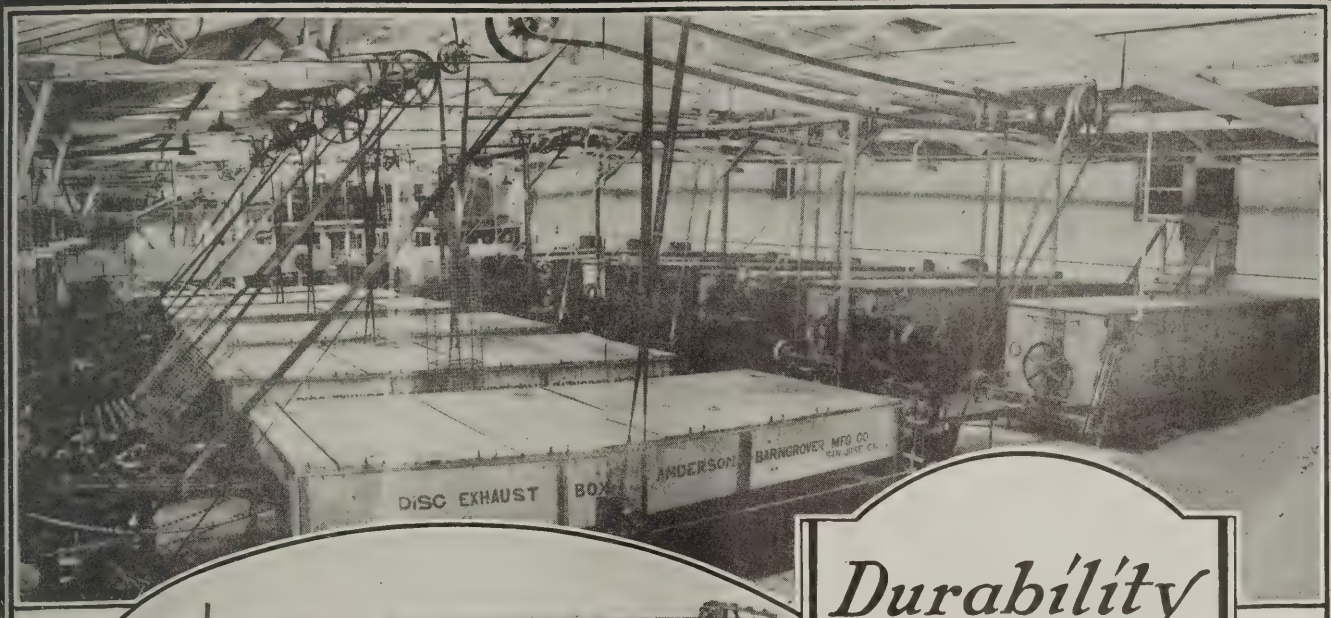
Another striking outcome of this experiment is the fact that within the wide range of processes used, i. e., between 30 minutes at 212 degrees and 30 minutes at 260 degrees F., no difference was noticeable in the test for vitamin C. In other words, if the heat was a factor in vitamin C destruction, it was too small a factor to be detected by the customary method of testing. This was true in spite of the fact that the highest cook used (260 degrees F.) is considerably higher than is ever used in the canning industry. According to a heat penetration determination, 25 minutes at 240 degrees F. is an adequate cook for cabbage packed according to the method described above. The lower cooks were used to have a wider range of temperature, and not as possible commercial processes.

There is another outcome of this experiment which may be of considerable significance, but which must be further investigated before arriving at final conclusions. At the time that this cabbage was cooked a barrel of the same lot of cabbage was shipped to Columbia University with the intention of feeding it in the raw state as a comparison with the cooked product. One gram per day of this cabbage was fed to one lot of guinea-pigs. In about the middle of January, 1923, after the experiment had progressed about a month, it became evident that one gram was inadequate to protect guinea-pigs from scurvy. In feeding this raw cabbage the outer leaves, which were somewhat wilted, were discarded, and only crisp inner leaves fed. In view of the fact that in several experiments that have been previously conducted with fresh raw cabbage one gram has always proven adequate, the possibility is suggested that during storage vitamin C is lost. In the canning industry it is well known that canning fresh from the fields is one of the essentials in high quality packing, and evidently this is true for vitamin preservation.

Three grams of canned tomatoes per day have been found to be adequate for a guinea-pig as an antiscorbutic, and as a result canned tomatoes are now generally accepted to be a rich source of vitamin C. In fact, the juice of canned tomatoes is used in many hospitals in place of orange juice as a supplement to pasteurized milk. In the World War canned tomatoes were included in the ration by virtue of their antiscorbutic content. In the basis of the outcome of tests on canned cabbage, we must class it also as a rich source of vitamin C. Recently corn beef and cabbage has been voted the most popular men's lunch. What would a soldier in the trenches say to a lunch of corn beef and cabbage? This is a suggestive question for the canner looking for new fields. Moreover, many a housewife would gladly use cabbage more frequently if she could avoid the odor incidental to cooking it. Canned cabbage would solve her problem, yet at present she is unable to buy it. This is a vegetable which is in season in the late fall, and hence offers an opportunity to extend the period of operating a canning factory.

OYSTERS—THE WORLD'S MOST VALUABLE SEAFOOD.

By Harrison W. Vickers, Jr., Commissioner, Conservation Department.



From the January, 1924, Maryland Conservationist.

IN writing this article I have referred to parts of a paper which I submitted on this subject at a meeting of the American Fisheries Society, at Madison, Wis., in 1922, as it outlines to some extent the past history of the oyster industry of Maryland, in addition to giving some valuable statistics, which I trust will prove to be of public interest.

Oysters are the most popular and the most extensively eaten of all shellfish; economically they are the most important of all cultivated water products, and, with the single exception of the sea herring, the most valuable of all aquatic animals. The oyster crop of the world in the year 1913, according to Government statistics, amounted to over 42,000,000 bushels and was valued at nearly $25,000,000. Of this output, the share of the United States was 88 per cent of the quantity and 69 per cent of the value. Of the remaining portion, fully 50 per cent belonged to France.

It is my intention, in this paper, to deal with the oyster problems of the Atlantic and Gulf coasts, and especially of the Cheaspeake Bay, the world's greatest oyster ground. Any food product of so great commercial value as the oyster and one which has given a livelihood to thousands of citizens for generations, warrants the most serious consideration of those entrusted with the care and preservation of the nation's fisheries.

The natural oyster bars and rocks of the North Atlantic States became practically exhausted many years ago. The oyster culturists of those states had no opposition when they determined to raise oysters by scientific methods. The main thing they lacked was the oysters to furnish the spawn and the seed oysters for the start in the industry. Naturally their attention was focussed on the section of the greatest natural production—Cheaspeake Bay. Then followed the greatest transplanting of oysters ever known in the history of this country. From 1875 to 1900 it

A-B COOKERS AND COOLERS MAKE GOOD

Hundreds of satisfied customers testify to the unfailingly dependable operation of these rugged, simple and safe sterilizing units which is not the result of favorable circumstances, but the logical recognition of good reliable service.

The A-B Cooking Unit is more than a product of steel and iron— it is an essential in the production of *uniformly cooked products*, a determining factor in the progress of its users because it facilitates the handling of the pack giving the most in output and quality for the least cost of operation.

Full Particulars From Any Of The Following Offices—

Durability

Not a matter of speculation with A-B Cookers and Coolers but actual performance over a period of years reveals the facts that sturdiness and correct workmanship enables them to resist hard usage and even time, long after less durable machines have come and gone.

The Anderson-Barngrover ideal of building a wealth of surplus strength into every part of this equipment to increase its years of usefulness— means a permanent installation and continued satisfaction ten years from *now* with your purchase of today.

was a common sight to see a dozen or more three-masted schooners from New England anchored in the waters of Tangier Sound, loading seed oysters, marketable oysters, and shells, which had been scraped from the rocks of the Sound, to be freighted to the northern planting grounds. The Maryland oystermen were pleased with the idea of a market, especially in the early spring, and no thought was given to the fact that they were selling their future livelihood. Tangier Sound alone was at that time producing about 4,000,000 bushels of oysters a year, and it required many years for the fishermen to awaken to the fact that the oyster rocks were exhaustible. It was but a few years after the transplanting of the Chesapeake oysters, however, before the New England oyster culturists started on their successful career as oyster growers. The cultivated oyster commanded a higher price and the product was marketed in a manner which greatly increased its value. The little State of Rhode Island developed bottoms which brought in considerable revenue, the oyster planter paying a rental of $10 an acre a year. The State of Connecticut sold its bottoms in fee, a great mistake from the State's standpoint, as was later realized, since it materially reduced the annual revenue from oyster bottoms.

It is said that until 1910 Massachusetts, Rhode Island, Connecticut, and New York were most successful with the cultivation of the oyster. The culturist had met and overcome all difficulties. The most dangerous and serious enemy to the northern bivalve, the starfish, had been successfully controlled by means of "tangles", and even the drill, with its rasping tongue did not effect successful oyster propagation in Ne England waters.

For practically the past 10 years, however, the n cessary set of spat has failed in northern waters, a thousands of acre of the best planting bottoms a now considered of little value. The cause of this se ious setback has been investigated by the Bureau Fisheries for several years, and while their report this subject has never come to my attention I unde stand the pollution of the waters is largely responsib for the lack of young oyster larvae, and the most se ious pollution has been found to be caused by oil slud from oil-burning ships.

The South Atlantic States, and especially Louis ana, which borders on the Gulf, have made much pro ress in oyster propagation, and have experienced noteworthy augmentation of yield during recent yea A government report in 1913 gave the seven leadi oyster states at that time as Rhode Island, Connecticu New York, New Jersey, Maryland, Virginia and Lou siana; in each of these states over 1,000,000 bushe of oysters were marketed annually. Virginia was t ranking state as regards production, with over 6,00 000 bushels, followed by Maryland with over 5,500,0 bushels and Connecticut with 4,000,000 bushels. A regards value of oysters taken, Connecticut and Ne York led, with over $2,500,000 each, followed by Vi ginia and Maryland with about $2,250,000 each.

One of the highest authorities in this country on said that nowhere in this country is there any excu for continuing to rely on public oyster grounds a sources of supply, and the proposition to discourage

Automatic End Soldering Machine With Wiping And Cooling Attachment.

The many unique features of this specially designed machine have proven very efficient for soldering and wiping the ends of all sizes of round cans. This machine is equipped with single drive pulleys for operating the entire machine except conveyor chains. The drive for can conveyor is independent so that the cans will not remain in soldering mechanism if the operation of the remainder of the machine is discontinued.

One of the essential features is the method employed in soldering, whereby the solder is applied to side only, leaving the end bright and free from solder, adding greatly to the appearance of the can. The runway guides in wiping attachment are hinged so as to allow quick removal of wiping brushes. The soldering rolls may be adjusted while machine is in operation.

The machine is supplied complete as shown, including elevator and runways.

Let us show you how to improve the appearance of your cans.

McDONALD MACHINE CO.

7600 South Racine Avenue Chicago, Illinois.

prohibit individual control of land for agricultural purposes would not be less absurd than to prevent or retard the acquisition of submerged lands for agricultural purposes. It would seem that this is a most reasonable and progressive statement, yet representing a part of the Chesapeake Bay region, where we have always had to depend on our large natural oyster rocks for production, I feel that we must still rely on our public grounds and adopt strong conservative methods to prevent their depletion. The 1913 statistics of the oyster industry show the preponderant importance of Chesapeake Bay; an output of over 11,000,000 bushels, which includes Maryland and Virginia, valued at more than $4,250,000, and the production of the Bay since has not varied more than 2,000,000 bushels from these figures.

In reviewing the statistics of the production of the oyster-producing bottoms of Maryland between the years 1865 and 1920, it may be of interest to know that these botoms produced 453,000,000 bushels of oysters which had a money value of $200,000,000, or an average of $3,571,428 a year. The greatest production in Maryland was between 1873 and 1893. The survey of the oyster bars of Maryland, 1906-1912, showed that the natural oyster rocks beneath the waters of the State covered over 200,000 acres at that time, although many thousands of acres had become depleted since 1885, and this depletion was on the increase.

Believing that it is essential to maintain the natural oyster bars and rocks in the waters of the State of Maryland, we are returning cultch, in the shape of oyster shells, to the partly depleted bottoms, and are leasing barren areas with suitable current and density conditions for oyster culture. During the long per from 1865 to 1920, aside from the cull law on the n ural oyster rocks, nothing whatsoever was done maintain the oyster bars. The fishermen of Maryl continued to resort year after year to the bars fo livelihood, and this overfishing naturally causes de tion. During the past two seasons over 428,545 bu els of shells have been carefully scattered on selec depleted bottoms with excellent results. The wri is informed that the State of North Carolina has a adopted this method. It is not believed, however, t this method will restore the natural bars to their or inal condition, but it is believed that shell planting w stem depletion and conserve this great natural wea lying beneath the waters of the Chesapeake.

For a real understanding of the true oyster c ditions in this State I think best to give the follow data showing marked decrease in the number of p sons engaged in the industry and their catch for e year during the past ten years:

Seasons	Tongers	Scrapers	Dredgers	No. Bus Oyster
1913-14.....	6210	599	571	
1914-15.....	5896	613	557	4,576,9
1915-16.....	5715	599	465	3,656,0
1916-17.....	7299	730	406	4,120,8

This clearly shows that although there has been a gradual decrease in the number engaged in the industry, the catch has about held its own.

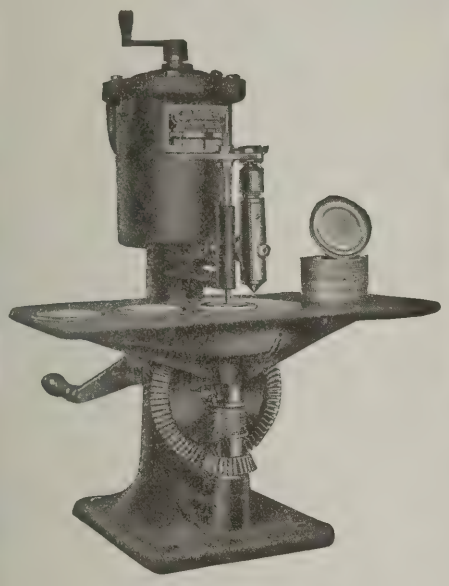
In order to increase the oyster output and restore the oyster beds, it is necessary to adopt some broad plan, such as extensive shell-planting and transplanting of small oysters. The success attained by the present Department in shell-planting demonstrates that if this policy is carried out on a large scale depletion could be stemmed and the oyster rocks built up.

I feel that it is demonstrated that shell-planting is a success, and the only practical cultch to restore the oyster bars. Some packers have advocated the transplanting of small oysters. From a planter's standpoint this is practical, but from the standpoint of economy and perpetuation of the natural oyster bars it is impractical, because as soon as the small oyster is matured it is removed from the bed, which leaves the rock as bare as before planting. In addition to this, the cost of seed oysters transplanted would be between 25c and 40c per bushel, and this feature would be prohibitive.

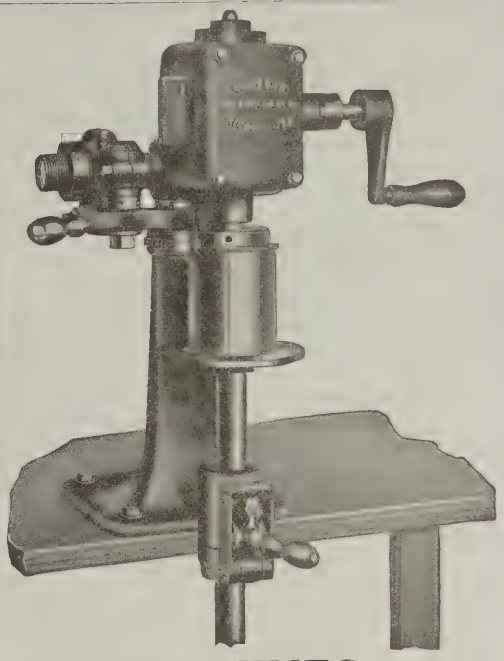
The oystermen, both tonger and dredger, have had a most profitable season, and the price of oysters has far exceeded any market in the past. Packers have been compelled to meet the prices demanded by the catcher, consequently I doubt if their profit is commensurate with the amount of money they have invested in their business. It is well to call attention to the fact that in so far as the oyster industry of this State is concerned sufficient revenue is derived from licenses and tax to pay all expenses of the Oyster Navy and Oyster Inspectors, and have a surplus over and above all expenses incident to this Department for carrying on its supervision of this branch of the work. Any deficit which requires an appropriation from the general treasury of the State for this Department is caused by it being required to maintain boats and inspectors for the purpose of protecting and propagating commercial and fresh water fish and for collection of licenses and inspection of crabs. Only a $1 license is required of the crabber, consequently only a small sum is received by the State for this privilege. The fish license is also nominal, and with these two continual drains on the revenue received from the oyster industry, we are required to seek an annual appropriation, not for the purpose of meeting any shortages in connection with the oyster industry, but to make up continuing deficits in the fish and crab industries.

The crab license should be increased from $1 to $2.50, with a license of $1 on minors under 16 years of age. The Anglers Associations of this State, recognizing the fact that they should contribute toward the cost of maintaining the fresh water fish hatcheries, have indicated their willingness to pay a license for the privilege of catching fish in streams stocked by this Department. In many other states anglers pay a license in conjunction with their gunner's license. As the catching of fresh water fish is strictly a sportsman's proposition, this branch of the work should be transferred to the Game Department, thereby relieving this Department of an expense of from $10,000 to $12,000 yearly, for which no revenue is received, and which amount up to the present time has been paid from oyster receipts. The oyster industry should not be called upon to support either the commercial or fresh-water fish industries or the crab industry. This Department, in so far as revenue is concerned, must deal with oysters, fish and crabs from a commercial standpoint, and each industry should be self-supporting.

STANDARDIZATION OF CANNERY TOMATOES.



TENTATIVE grades for cannery tomatoes have been formulated by the U. S. Department of Agriculture for the purpose of providing a basis for agreements and purchases of raw material used in the manufacture of canned tomatoes and tomato products. It is hoped that the use of specific standards will produce better business relations between manufacturers and growers, and ultimately result in a measurable improvement in the quality of the stock delivered to the cannery.

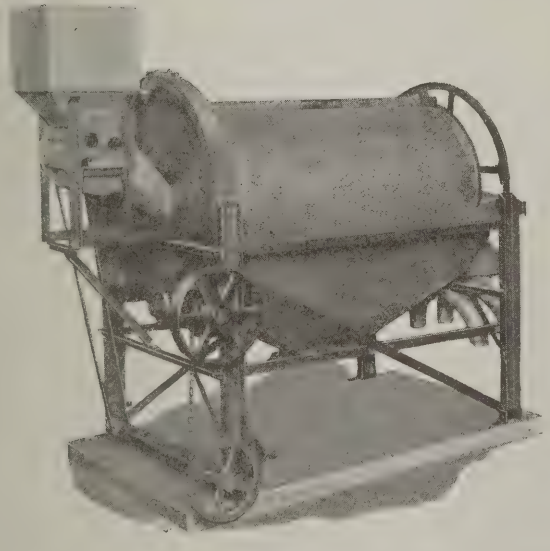


The principle of standardization is now firmly established and becomes more popular each year, the department says. Grades are widely used in the buying and selling of farm crops, and are now considered a necessary feature of any well-ordered system of marketing. It is felt that grades probably can be made applicable to most, if not all, of the fruits and vegetables grown for canning purposes.

Up to the present time there have been no standard grades for cannery tomatoes. Some manufacturers have endeavored to buy on more or less definite specifications, but there has been little uniformity in the terminology and application of such locally drawn standards. Establishment of federal grades will enable all canners to buy on a quality basis and enable growers to sell tomatoes at prices commensurate with the quality delivered, the department says.

Success of the department's system of grading cannery crops seems to depend largely upon the establishment of definite gradations in price to conform with the variations in quality and condition, it is pointed out. Such price gradations will furnish a stimulus to the grower to strive to deliver only a high quality product, in order to secure the attendant premium. A fair basis for discounting deliveries of low grade tomatoes will also discourage the grower from delivering low-grade stock, and bring about a marked improvement in the quality of the tomatoes grown and harvested. The grower who finds that he is unable to produce tomatoes that will grade U. S. No. 1 will be inclined to discriminate more carefully in the purchase of his seed or plants, and will focus his interest on the elimination of the unproductive and poorly adapted strains of tomatoes and the constant improvement of a few well-selected varieties, the department feels.

Growers of cannery tomatoes will not be expected to use the proposed grades as a basis for separating the crop into two or three classes before hauling to the cannery, as this probably would unduly increase handling costs. Canners ordinarily are not equipped to handle lots of different qualities separately, and since individual lots lose their identity immediately after being unloaded, there would be little advantage in doing extensive sorting of the crop in the field, the department says. It is felt that the more logical plan would be for manufacturers to employ the standards as a basis for sampling the loads as they come to the receiving platform, thereby ascertaining the grade and fixing the value of each load.



CAMERON HAND OPERATED MACHINES

This double-seamer attaches bottoms to can bodies and covers to filled cans. The Compound Applier spreads the rubber cement on the edges of the can ends. These machines are suitable for cans from 2" to 6" in diameter and up to 9" high.

CAMERON CAN MACHINERY CO. **240 N. Ashland St., Chicago, U. S. A.** 23

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

The principle of buying cannery tomatoes on grade is meeting with considerable interest among canners of tomatoes and tomato products, and several manufacturers have indicated their intention to try out the proposed Federal standards as a basis for their buying next season. One manufacturer in Southern New Jersey has incorporated the U. S. No. 1 grade in his agreements with the growers. In Western New York the grades will be used by one large operator on a portion of the acreage which he has under contract for 1924. Indiana canners have assured the department that they are heartily in accord with the efforts being made to formulate a fair and workable system of grading, and have offered their co-operation in getting such a system established uniformly in that State.

The tentative grades have been approved and adopted unanimously by the Tri-State Packers Association, an organization representing the cannery interests of Delaware, Maryland, and New Jersey. It also is reported that the proposed grades probably will be established as legal grades in New Jersey by the Bureau of Markets of the State Department of Agriculture.

INDIANA CLAIMS THE TITLE

A Canned Foods Week Lesson

The following is an Editorial as it appeared in the Indianapolis Star of February 29, 1924

WORLD'S TOMATO CAPITAL

It is a distinction worth while to be known as the world's tomato capital, a term applied to Indianapolis by a speaker at a Rotary Club meeting on Tuesday. For the tomato is a noble product. It is commonly designated as a fruit, and that seems the proper name, but, scientifically, the plant is described as an "herb," and there are botanists who class the growth upon the herbaceous stems as a vegetable. By any name, however, it is a creation of which to be proud.

It is, in fact, a human creation. To nature, of course, may be given the credit for the original plant, with its little berrylike product called "love apples," and regarded as poisonous, doubtless because of the botanical relationship to the night shade family. There are people now living who remember the love apple, a plant or two of which was sometimes grown in a corner of the garden as an ornament. But there were miracle workers with plants long before Luther Burbank's time, and among them were some who took the love apple and developed it until the red berries became wonderful growths—beautiful globes weighing a pound or more each, or the "beefsteak" variety even larger—all of the richest shade of red, sometimes verging almost into purple.

The cultivated triumph of the garden is not only a valuable and valued addition to the long food list of America, but is also a delight to the eye. The tomato is one of the most decorative of garden products. Piled up in baskets or on tables in market, it adds beauty of color to the food supplies. As salad it lends a pleasing bit of color to a dinner table, and as food it is a perennial and universal favorite. Raw, cooked in innumerable ways, made into sauces and soups, pickled, preserved, canned, it is a standby of the housewife and the cook, and a dish of which no consumer tires.

It is not surprising to hear a man experienced in the canning industry say that the best tomatoes are raised in Indiana—the largest and best flavored, provided with the most perfect blend of salts and sugars. How could it be otherwise those who know the merit of our home product will ask. And when from another authoritative source comes the assertion that the fruit is of rich vitamin merit, who could surpass it? Let us be proud of our State's new honor.

SIR EDWARD PENTON'S FAMOUS FIRM TO REPRESENT ARABOL ADHESIVE IN ENGLAND

Head of Prominent English House Closes Negotiations for Handling Products of the Arabol Manufacturing Company in British Isles.

THE industry may be interested to know of important arrangements recently completed between Sir Edward Penton and the Arabol Manufacturing Co., whereby the entire line of Arabol adhesive products will be carried in London and promoted throughout the British Isles by one of the largest and best-known houses in England.

Sir Edward Penton returned to England on February 16th after spending three active weeks in this country, during which time he closed negotiations with the Arabol Manufacturing Co., and attended the National Shoe Retailers' Association Convention in Chicago, February 11th to 14th. He also visited Boston, where he was the guest of honor at a dinner given at the Harvard Club by Mr. Everit B. Terhune. A large number of prominent New England business men were present at the dinner and had the pleasure of meeting the distinguished visitor.

The arrangement just effected means that E. Penton & Son will actually carry in their London warehouses the full line of Arabol gums, glues and pastes for labeling, wrapping and sealing. This will enable them to supply the British industries from stock, with identically the same adhesive products now being furnished to the trade in the United States and Canada. American machines for labeling, wrapping or sealing food and drink containers, are rapidly being installed throughout the British Isles, and there is a corresponding demand for the proper adhesives to use on these machines. In addition to handling such gums for both machine and hand application, the house of E. Penton & Son will carry the full line of Arabol adhesives for boot and shoe manufacturers, trunk and bag manufacturers, paper box manufacturers and various other fields of industry which are already served in the United States and Canada by the Arabol plants. Incidentally, the Arabol Manufacturing Co. is the largest organization in the world specializing in the manufacure of adhesives for all purposes. Established over 36 years ago, the Arabol Company today operates three large up-to-date factories in Brooklyn, N. Y.; Chicago, Ill., and Brampton, Ont., and more than a hundred different classes of industry are supplied from these plants. Besides their three main offices in New York City, Chicago and Toronto, seven branch sales offices are maintained in the United States for the purpose of covering the entire country.

Sir Edward Penton predicted a large expansion in the sale and application of Arabol products throughout the British Isles.

SUNSHINE FROM OREGON.

Corvalis, Ore., January 28, 1924.

"Enjoying fine winter; bright, sunshiny days intermingled with light, warm rains. Average temperature about 50. Been doing some field work with the growers. Everything points to a fine crop of fancy quality fruits in 1924. Contracting of strawberries very active. Most canners have contracted all the available crop of Western Oregon. Growers are accepting reasonable prices for their crops.

"However, prices of future canned foods will open slightly higher in 1924 than in 1923."

Sent in response to a "crop report" card mailed out by us last summer, and we're glad to get it. Aren't you? Who has another?

THE MERCHANDISING BROKER.

By S. C. Bell.

BEEFSTEAK smothered with onions, facts smothered with adjectives, is the impression one gets in reading the learned dissertation entitled "The Merchandising Broker" in your issue of January 2.

The writer misses your point entirely. Never have we heard any criticism of the merchandise broker who handles consigned merchandise, or who makes up pool cars; our observation has been that the criticism has been directed against the so-called "Merchandising Broker" who buys merchandise on his own

account, and sells it. His position is within the law; so apparently was the "Teapot Dome" scandal, but not above criticism. Above criticism if he will represent himself as a jobber, but not if he represents himself as a broker. Let him call himself what he is, and not endeavor to sail commercially under two flags.

Can a food manufacturer expect to receive authentic information on market conditions from a so-called "Merchandising Broker" whose interests primarily are to own merchandise at the lowest possible price?

As a food manufacturer we want brokers, not jobbers representing themselves as brokers. It isn't a very long story. We never heard of a junk dealer classified as a wholesale hardware merchant, so why classify a jobber as a broker?

"Merchandising Brokers" whose purchases and sales total over a million dollars per annum are still classified as brokers, and are officers in local brokers' associations and members of the National Association as well. These are facts, not adjectives.

JUST NOW.

F. H. Bilderback, Bristol, Pa.

Just now I'd like to listen
To the patter of my feet,
At Palm Beach or Miami
Where the air is balmy sweet.

To follow all the song birds
To that spicy, flowery land,
My spirits would awaken
Digging fissures in the sand.

Gazing at the white-capped billows,
Sniffing 'long the ocean spray,
Jumping in my bath regalia,
Floating idly 'round all day.

Then at dusk you part the incense
As you saunter to your bed,
Oh, the world is full of grandeur
In that land where flowers wed.

Here I'm groping for that dollar
That I never can quite catch,
While the sparrows keep on twitting
It's most time to leave your hatch.

THE CANNING TRADE
THE Journal OF THE Canning AND Allied Industries
ESTABLISHED 1878

The Markets

BALTIMORE, MARCH 10, 1924

WEEKLY REVIEW

Canned Foods Business Has Settled Into Steady, Regular Demand—Demand for Both Spots or Futures Good or Bad "As to Seller"—Most Spot Articles Firm or Advancing—Futures Selling Steadily—Brokers Quote Prices on Futures.

AS TO SELLER—Spot business in canned foods is reported by most brokers as being rather quiet this week, and not a few operators are surprised at this because usually at this season of the year there is a good, brisk demand for the full line of canned foods to meet early spring seaside requirements. Time was when the market depended rather largely upon this "hotel demand" for good business at this season. Average popular consumption has caught up with this former relatively heavy demand, and so this trade, while welcomed now, cannot longer be said to be unusual. It is all now in the course of a day's business. But one thing is very noticeable: the canners who sit down and wait for trade to come to them—and because of the unusually well cleaned up condition of all spot stocks, the tendency, if not the temptation, of most canners is to so wait—are finding the market dull. On the other hand, those few canners who are up and astir after trade, putting some selling efforts behind their goods, are finding that business was never better. So, when you come to judge the market condition, you must take into consideration this phase, and hence we say "as to seller." Canned foods consumption has grown to such a size, and seems to be gaining like the snowball rolling down hill, that if ever the great body of canners learn to put selling efforts behind their goods, and not be content to idly sit down and wait for some buyer to come looking for bargains—at the lowest quoted prices in the market—this page, and any market report as to prices, will hold scant interest for the industry. The best market advice that we can give to the industry today is to note a slow, but certain, change coming over the marketing of canned foods. Observant canners are becoming aware that the best buyers are no longer squabbling over a difference of 2½c per dozen for the kind of goods they want, from the sort of canner they have learned will deliver them. In other words, they are buying reputable goods from reputable and dependable canners without much haggling, whether they be spots or futures, and the effect of this is beginning to tell upon all canners. It is just one more result of quality, and it is the most certain result in all the market considerations.

The jobbers know that the consumers will continually take a satisfactory article in canned foods at a fair price which pays them a profit, the one all-necessary thing, above all others, being that the goods always prove satisfying. This does not mean fancy goods in all instances, but just a good average high quality and the absence of poor, watery or otherwise unsatisfactory goods in with what purport to be the good goods. When a canner has established himself as a packer of such goods, the jobber sticks to him, and is glad to do so, and is glad to pay him a price that will insure a continuance of such a supply. You see that in the cleaned-up condition of spot goods from such hands, and in the number of such canners sold up on futures at this time. No rule, of course, works absolutely, and there must be holders of spot goods of quality today, and some canners of such quality goods who are not sold up on futures as yet; but that is because the jobbers have not run across them; and they have not run across them because, as we said above, they have been sitting idle, awaiting the coming of the buyer. Prove this for yourself. Note how carefully the good buyer inquires as to the packer of the spot goods offered now: are they good gods, dependable and up to standard, The day of price and price only is passing, and we hope forever. It will be forever if the canners make it so. And there is only one way to make it so: Pack Quality. Of this you may be certain: there is an ever-increasing number of canners who have nailed the flag of quality to their masts, who have packed quality goods for the past two or three years, and will pack nothing else in the future. Their number is large—larger, perhaps, than a whole lot of market jugglers would like to believe—and it is growing, and for the same reason the number of uncertain, non-dependable, take-a-chance canners is growing less and less. And it will be smaller in 1924 than ever before. And it had better be, especially on futures, because the packs will be fairly large, if Nature permits it, and if the goods are not up to quality, the sellers may expect rejections.

THE MARKET—From most sections come reports that Canned Foods Week is causing heavy consumption of retailers' stocks. Chain stores say they are passing out immense quantities of canned foods of all kinds. Beyond a doubt the ultimate result of this great work will be a further boost in the consumer numbers and greater demands upon the rapidly lessening supplies. Then must come the heavier demands for replacements. The spot market needs no such boost; it is as strong as one could wish. And it probably will not be much stronger. The buyers are taking their supplies in a very quiet, small way, and not running the prices up against themselves. In many sections there are clear indications that the consumers will not pay higher prices for the goods—that they have reached the ultimate point so far as the average consumer is concerned. Therefore, if heavier demand should force the prices higher, consumption will slow down and with it further demand. The encouraging feature is that the demand will, almost certainly, clean out all markets before new goods can be produced.

Barring pumpkin, on which there has been a drive to clean out spot stocks, and which records a drop to $3.75 from $4.25 in this market, all changes in prices have been in an upward way. No. 3 sieve peas, in this market have advanced to $1.45, and No. 4 sieve, which were out of quotation for a long while,

have reappeared and are quoted at $1.40. All spot peas are strong, and futures, if possible, even stronger.

Succotash, with green limas, has advanced to $1.60, with dry limas at $1.40 and the Maine article is out of quotation.

No. 3 sweet potatoes have advanced to $1.30 in the county, and to $1.40 in this city, and No. 10s are held at $4.00, with supplies of all kinds cleaning up well.

There have been rumors set afloat in the Central West and elsewhere that spot tomato prices might be expected to slump. It would be interesting to learn the real reasons why, if the rumor-mongers have any real reasons. Hardly necessary to say that they intimate that the jobbers have big blocks of goods in hiding or holding, and that other blocks are ready to topple on the market any time. The manner of buying, with rush orders attached, belies this, if the manner of conservative buying for the past year or more did not do so of itself. It might be well to remind the tomato speculator or interested buyer that all records for high prices in tomatoes have always occurred in the late spring months—and that these months are still ahead of us. When the curtain is run up on the 1924 tomato canning season, we believe they willl find the stage completely bare of canned tomatoes. That is how it looks today. Even canned apples have joined the upward procession and are now quoted here at $3.25 for No. 10s.

Salmon will have to be added to pumpkin in the downward column, as it is quoted in our pages this week at $1.30, as against $1.35 previously.

FUTURES—Future tomatoes are said to be selling fairly well, without any undue excitement or in excessive blocks. Canners whose reputations for good quality goods are known are having less trouble booking a satisfactory amount of business than others, and at prices without haggling. Some canners, of course, are still like Barkus, waiting and willing. The situation is somewhat disturbed by occasional offerings of "a limited quantity" at below going prices. That means a reduction of about 2½c, generally from the market. As there are uncertain canners, so there are also uncertain buyers, and the goods, therefore, find a market. Prices are as we last quoted them.

Future corn was in somewhat better demand. There have been buyers looking over this market for their corn supply, caused possibly by the filling up of the Western corn canners and of some other sections. One might well be warranted in believing that there has been more future corn sold than generally intimated. Orders are moving onto the books in quite orderly fashion, and most canners are receiving a good share. There is nothing to be gained by waiting because there seems to be no good reason to expect lower prices on corn and the good packers of corn are not wanting for buyers, as a rule. Future prices in this article are unchanged from last week.

Thomas J. Meehan & Co., in their most recent circular, quote future prices as follows:

No. 10 tins Cut Green Stringless Beans	$5.00 Balto.
No. 3 tins Cut Green Stringless Beans	1.35 Fac'y.
No. 2 tins Cut Green Stringless Beans, $1.00 fac'y	1.00 Balto.
No. 2 tins Bush Limas, white, $1.00; medium green	1.65 Fac'y.
No. 2 tins Bush Limas (Tiny), $2.10; gr. & wh. med.	1.20 Fac'y.
No. 10 tins Fresh Baby Lima Beans (med. green)	6.75 Fac'y.
No. 10 tins Fresh Baby Lima Beans (mixed gr. & wh.)	5.75 Fac'y.
No. 2 tins Standard Succotash (dried limas)	.95 Fac'y.

No. 10 tins Standard Succotash (Dried Limas)	5.75 Fac'y.
No. 10 tins Succotash (Gr. Corn and Gr. Lima Beans)	6.00 Fac'y.
No. 2 tins Standard Crushed Corn	.90 Fac'y.
No. 2 tins Triple Succotash, $1.25; No. 10 tins	6.00 Fac'y.
No. 2 tins Spinach, $1.00; No. 2½ tins, $1.40; No. 3 tins, $1.45; No. 10 tins	4.25
No. 2 tins Extra Standard Crushed Corn	.95 Fac'y.
No. 10 tins Extra Standard Crushed Corn	5.75 Fac'y.
No. 10 tins Standard Crushed Corn	$5.50-$5.75 Fac'y.
No. 10 tins Ex. Std. (Double Cut) Evergreen Corn	6.00 Fac'y.
No. 2 tins Standard Shoepeg Corn (Whole Grain)	1.15 Fac'y.
No. 2 tins Ex. Std. Shoepeg Corn (Whole Grain)	1.25 Fac'y.
No. 2 tins Fancy Shoepeg Corn (Whole Grain)	1.30 Fac'y.
No. 10 tins Whole Grain Evergreen Corn	5.50 Balto.
No. 2 tins Whole Grain Evergreen Corn	1.00 Fac'y.
No. 10 Mixed Vegetables	5.00 Balto.
No. 2 Mixed Vegetables	.90 Balto.
No. 2 Pole Lima Beans, $1.65; No. 10 tins	7.75 Fac'y.
No. 10 Tiny Green Bush Lima Beans	9.75 Fac'y.

NEW YORK MARKET

Name on the Label Bill in New York Legislature—Jobbers Are Fighting These Bills—Trading Is Satisfactory—Future Spinach Prices—Future Salmon Selling—Maine Corn Prices—Tomatoes Firmer — Corn Firm—Notes and Observations.

New York, March 6, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

PACKERS' Name on Label—Wholesale grocers are seriously concerned over a bill now before the State Legislature, providing that no packer or distributor of canned or preserved fruits, vegetables or other food commodities shall sell or offer for sale these commodities unless the cans, jars or other containers are labeled to indicate the contents, quality, address and place of business of the person or corporation canning or packing them, or the name of the wholesale distributor in the State selling or offering the same for sale. The name of the State, county, city, town or village where the goods are packed is to be preceded by the words "packed at." In addition, soaked canned foods, packed from dried or cured products, must be labeled upon the face of the label in legible type one-half inch in height and three-quarters of an inch in width, with the word "Soaked." Importers will be compelled to relabel their imports to comply with the provisions of the proposed law.

Don't Want Packers' Names—Distributors are mainly concerned with the provision requiring the use of the packer's name on the label. This subject received considerable attention at the convention of the New York Wholesale Grocers' Association here last month, when the Johnson bill, now in Congress, was discussed. The provisions of the Johnson bill are very similar to the bill in the State Legislature. Chain store grocers are also opposing the proposed bill. Alfred H. Beckmann, secretary of the National Chain Store Grocers' Association, discussing the bill, says: "Our members will appreciate the impracticability of such laws. It will compel a large unnecessary expenditure of money, without any benefit to the consumer. The existing food laws, both State and Federal, fully protect the consuming public, and if the name of the manufacturer or packer appears on the label, it must be the true name. If the name of the distributor appears on the label it must be accompanied by the words "packed for" or "distributed by," either being used to avoid deception. Furthermore, under existing laws both the manufacturer and distributor are responsible, and the distributor nearest the consumer, as in the case of the chain store grocer, offers more security to the consumer when the words "packed for" or "distributed by" appears on the label than the name of some often unknown manufacturer or canner. This applies particularly to canned foods, as in very many cases the canner packs for the distributor and never uses his own labels."

Who's to Blame?—Distributors are all wrought up over the appearance of the bills in Congress and the State Legislature, and are asking: "Who is behind the bills?" It never seems to occur to some of the buyers that perhaps from the canners' standpoint it is quite desirable for him to have his name on the label so that he can reap part of the benefits from quality packing.

The Market—Trading in the market has continued on a satisfactory scale during the week. Spots are going well, and there is a broadening demand for futures as new prices appear on the market.

Fruits Firm—Continued strength is reported in canned fruits in the California market, and the smaller operators who are now clearing up the small surplus stocks of odds and ends are quoting about on the basis of the larger operators. This gives a fair idea of the strength of the Coast position, as the smaller independents generally undersell the Corporation and other large packers by five to ten cents per dozen, at least.

Future Spinach—Following the announcement of opening prices on 1924 pack spinach by Libby, McNeill & Libby, the California Packing Corporation has named a formal opening as follows: No. 1s, $1.05; No. 2s, $1.20; No. 2½s, $1.50, and No. 10s, $4.85. The prices are the same as Libby's and are guaranteed against the Corporation's own decline to the end of the year.

Salmon—Alaska canners are now taking S. A. P. business on future salmon, and report orders as surprisingly good for this season of the year. The market on salmon for Coast shipment rules unchanged at $1.25 on pinks and $2.25 on reds, both F. O. B. Seattle. Demand in the local market continues quiet, little Lenten buying having been done by the trade as yet.

Future Maine Corn—Business is being taken on future Maine fancy corn at $1.47½ per dozen for fancy Crosby and $1.75 for fancy Golden Bantam, F. O. B. cannery. There is a good demand reported. Some of the canners report that they have already booked about as much future business as they care to take on this early in the year.

Canned Foods Week—The Canned Foods Week campaign has been successful thus far in the New York territory. All of the chain stores have featured canned foods in their advertising, and retail grocers have also taken hold of the movement with enthusiasm.

Tomatoes Firmer—Increased buying has strengthened the market for Maryland tomatoes somewhat, and many holders are now firm at 95c F. O. B. on standard 2s, with 3s at $1.40 and 10s at $4.75. Future tomato business continues quiet and routine, the market remaining nominally unchanged at 57½c for 1s, 87½c for 2s, $1.27½ for 3s, and $4.00 for 10s F. O. B. country cannery. Not all packers are offering at these figures, however, and advance reports of raw material costs, taken with the uncertain labor situation, would seem to justify a higher price basis.

Southern Corn—There has been a slight firming up in the market for Southern corn, the market ranging 92½c on standard, with the top price prevailing on corn of really desirable quality. Trading in futures continues quiet, the market holding at 90c to 92½c on standards and 97½c to $1.00 on extra standards.

Notes and Observations—C. A. Haldt has resigned as manager of the New York office of the Thomas Roberts Co.

M. H. Brotman, of Avery-Brotman, Ltd., canned foods brokers, of Vancouver, B. C., was in the market during the week.

W. W. Roberts, of the Neptune Seafoods Products Co., canners, of San Diego, Cal., was in the market during the week.

Effective March 10, the firm name of Kilian & Clark will be changed to Kilian & Co., Inc.

L. F. Bridges, of Sanford & Timpson, left this week for a visit to the Pacific Coast.

W. D. Breaker & Co., Inc., have been appointed New York sales representatives for Kemp Bros. Packing Co., of Frankfort, Indiana.

Charles T. Ward, vice-president and general manager of Francis H. Leggett & Co., returned this week from an extended European trip.

R. E. Francis, of the Poll Packing Co., of Miami, Fla., was visiting the trade early in the week.

CHICAGO MARKET

Retailers Busy Selling Canned Foods—Attention Turning to Spot Stocks—Brokers Find It Hard to Locate Spot Goods —All the Central West Strongly Behind Canned Foods Week—Market Practically Nominal—Pumpkin Only Thing Being Pushed—Salmon Prices Being Reduced.

By "Wrangler,"
Special Correspondent "The Canning Trade."

Chicago, March 6, 1924.

BUSY Selling—The buying of canned foods at wholesale was temporarily suspended in this city this week, as the retail grocers are all so busy with their Canned Foods Week business that they have had no time to buy from the wholesalers, and the wholesalers are marking time, so far as canned foods are concerned, until the result of the big national sale is ascertained by the retailers and until they begin to replenish their broken assortments.

Futures—Brokers say that the wholesale grocers have become "fed up" on futures, having contracted for all or more than they have sold to the retail grocers, and that they have transferred their interest to spot canned foods for prompt delivery, being confident that there will be a big clearing out of the stocks of retail grocers reported from last week, and that there will be some lively buying next week and afterward.

The spot situation as to canned peas, tomatoes and corn is growing very difficult. Wholesalers are disposed to negotiate for spot goods, but the brokers say that it is exceedingly hard to find qualities that are acceptable to the buyers at prices that they are willing to pay for the goods.

From everywhere in the Central West I am hearing good reports from Canned Foods Week. The Chicago wholesale grocery houses are, as usual, doing their full share of the work, and many of the houses that push their own brands or labels are spending money freely advertising canned foods.

The prices of the staples are substantially unchanged from my last week's report, but at that prices are almost nominal, for goods are so scarce that the transactions closed for spot goods are not frequent or large enough upon which to establish changes of prices.

Pumpkin—There is some pressure to sell a few lots of canned pumpkin, yet unsold, as the season for pumpkin pies is drawing to a close, and I have heard of a price of 85c for 3s and $2.75 for 10s, f. o. b. cannery, being made.

Salmon—Indications from the Pacific Coast are that the holders of canned salmon are disposed to sell freely, and a sharply reduced price on halves flat in all the Alaska grades has been named, as there is said to be an overstock of that size.

Some of the wholesale grocery houses have reverted to their former policy of buying frequently, but in small lots, and have so denatured their canned foods business that brokers find calling on them unprofitable, and call on them only after they have offered their best bargains to the houses that are alive in the market.

The local chain stores are doing a good business and are buying some goods. The largest chain, which has its headquarters in Jersey City, and which is said to be the largest in the country, has a wholesale house here, but buys nearly all its goods through the Eastern office. Brokers have about quit calling on their buying department here, as they say that it is so difficult to get access to the buyer, and their purchases are so unimportant that it does not pay to bother with them.

The mail-order houses are apparently loosing their business in the grocery lines, as their canned foods departments are said to be buying in a very trivial and unimportant way.

It is said that the discontinuation of some of their sales methods of selling sugars or other goods far below cost and limiting the purchase to buyers who ordered a quantity of other goods at the same time, which was stopped by the Federal Trade Commission, has created a dent in their grocery sales, and has put the small local retail grocers in a position to more than meet their competition.

The Western Canners' Association will probably hold its April (1924) Convention April 22, 23 and 24, but the directors have not yet decided where. They will do so in a few days, however, and special railroad rates will be applied for and a program announced.

ST. LOUIS MARKET

Market "Feels" Better Since the Settlement of the Swell Claims Matter—Seasonable Weather Is Increasing Canned Foods Consumption—Looking for Cheaper Future Tomatoes—The Quotations—Hunting for Peas a New Game—Pineapple Is Not Selling as It Should.

St. Louis, March 6, 1924.

By "Missourian,"
Special Correspondent "The Canning Trade."

THE Market—There has been a normal demand for canned foods the past week, with no special feature except the settlement of the swell controversy by the adoption of a partial flat allowance, thus paving the way to a uniform system of settlement in making contracts for 1924 packs. This adjustment of differences between distributors and canners was made just about the time that the trade entered the future market with offerings of practically all important items, either at fixed prices or S. A. P. While it is yet too early to expect it to have much effect on the scope of trading, the whole trade is more

optimistic as to the volume of contract sales. While the general movement is not as good or as large as packers anticipated, there is a good, healthy demand in evidence. Winter weather and the limitations of fresh vegetables have caused an improvement in the market for canned foods. The reduction of jubbers' stocks will no doubt encourage a development later on, with prospects of increasing volume as the season develops. Vegetables have had an unusually heavy demand from consuming sources, while fruit and fish have shared about equally in the increased business of the past few days.

In the list of canned vegetables attention has been divided between peas, corn, tomatoes, spinach and asparagus futures, topping the situation in each of the three departments.

Tomatoes—While canned foods brokers are hustling for business on new Southern tomatoes, prices must be shaded to interest buyers. The latter are using every method they know of to get the market down, but canners say that the $15.00 a ton price to growers for raw material that has been established does not justify further declines. Spot tomatoes are steady. Some sellers say they are not able to book future orders, while others state they are doing a "fair" business. Most distributors are not willing to consider Eastern or Western, believing that canners may make radical cuts in their opening prices before the market closes. Some large buyers here say they have not bought a case of Southern or California packs, while others admit that they have done but little contracting. It is said that dealers have a sufficient quantity of old packs for current requirements, and when they buy it is not generally in large blocks.

The market on Missouri tomatoes is quoted as follows: Spot—No. 1, 65c; No. 2s, 95c; No. 3s, $1.40; No. 10s. $4.75. Futures—No. 1s, standard, 10 oz., 60c to 62c per dozen; No. 1s, tall, 15 oz., 76c to 77c q. w.; No. 2s, standard, 90c; No. 2s, extra standard, 95c to 97½c; No. 2½s, standard, $1.20 to $1.25; No. 3s, standard, $1.30; No. 3s, extra standard, $1.37½ to $1.40.

Corn—There is considerable interest in corn, both spot and future. The shortage of goods in the hands of those who delayed making contracts last year has made 1924 packs more readily salable. Future standards are selling in a conservative way. Southern and Western standards have not been speculatively bought, but a very fair volume of future sales have gone through. Spot corn is steady and in fair demand, but mostly for routine purposes. Fancy lines are firm by reason of their scarcity. Middle Western is gaining in popularity.

The corn market for spot is 95c; future Mid-West standard, $1.10; fancy, $1.15 to $1.30.

Peas—Old pack peas are scarce in all lines, but the various grades can be had if the buyer is willing to pay the price and hunt long enough for a resale block. The buyer cannot be expected to be particular as to brands or limit himself to certain sized blocks. What can be obtained must be taken. All lines are sold at high prices. There are no soft spots. Now that canners are inclined to add to their future selling prices of standard Wisconsin lines, buyers are losing interest. Packers report they have pretty well sold up and a number are turning down offers. The largest volume of futures ever done in canned foods is said to have been done in peas. Never before has such a large volume of the new pack been sold at this season of the year. As a well-known local broker stated, all reports from Wisconsin are to the effect that the acreage of Alaskas this season will be limited not because canners do not want Alaskas, but because seed is not available. "Plantings," he said, "will be curtailed, but the reduction will be offset by the acreage set to sweets. All indications point to the largest pea acreage Wisconsin ever put out, with many new factories packing, and those in the game operating to full capacity. The outlook is for a production all over the country at well over last season's pack of practically 14,000,000 cases. This outlook has influenced some buyers in taking on futures, but general buying in Wisconsin and other States has been of such proportions that even in face of the big prospective pack many well-known canners are either sold up or are oversold. This does not mean that peas cannot be bought, but it does mean that the jobber cannot pick and choose his canner or his assortment. Some brokers have had no trouble so far in getting through confirmations, but others have orders turned down for the various grades and siftings. Canners assert positively that they are cleaning up their packs on contract sales, and that before canning starts they will have nothing to do but give their undivided attention to filling their contracts."

Miscellaneous — String beans, limas, succotash and other varieties of canned foods continue in fair demand, with no change in prices. Sales of asparagus on which 1924 opening prices were named some time ago are reported backward.

Fruits—Canned fruits are quiet. Pineapple is in hand-to-mouth demand, with pet brands even of the most desired grades being offered for sale in sacrifice lots, but there are no takers. When a general favorite like pineapple does not sell as freely as usual for this season, something is wrong with the market. Retail sales are restricted in this pack, and it is admitted that it is not going over the counter as it should. For some reason the consumer does not care to pay for pineapple, but takes peas and other canned foods at relatively the same prices. Similarly, California fruits are quiet in the retail field, which is reflected in the wholesale market. Incidentally, both pineapple and California fruits of the new pack are not going as well as expected on an S. A. P. basis. The whole fruit line is quiet, although there is not a large unsold surplus at the canneries or in the large jobbing markets.

Fish—Salmon is selling more readily at prevailing prices, with a few concessions on incoming stocks for quick disposition. There has been less buying from the Coast, although it is understood that some attractive offerings have been made during the past few days. Pinks appear to lead in popularity. Prices are fairly maintained on the spot with few exceptions, quality in these cases being the determining factor in the price.

Canned Milk—There is little activity in the condensed or evaporated milk market, hence there is no change in conditions. Prices are nominally unchanged, but on the unadvertised brands some discounts are being made. Both packs are moving fairly well. Other forms of canned milk are quiet and featureless.

CALIFORNIA MARKET

Growers Becoming Disheartened—Artichoke Canning Begins—Opening Prices on Spinach—Smaller Pack Expected—Growers Demanding High Prices for Tomatoes —Exports Heavy—Fruits Assortments Badly Broken—Canned Peaches to Be Advertised—Notes.

San Francisco, March 6, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

GROWERS Disheartened—The reporting of weather conditions in California may seem a monotonous repetition, but crops are dependent upon rainfall and the long continued fair weather is most disheartening to growers. February started off in a promising manner, but the storm proved a light one and reached only a little south of San Francisco. The snowfall in the mountains has been almost negligible, and many streams are now lower than is frequently the case at the height of summer. A serious situation is prevailing and some crops will be light, no matter how heavy the late rains may be. The continued warm weather has forced orchards into bloom much earlier than usual, increasing the frost hazard, and it would occasion no surprise if there were losses from this source.

Artichokes—Opening prices on California canned artichokes have been put out by the Ocean Shore Canning Co., which operates a plant at Half Moon Bay, in the heart of the artichoke-growing district. The packing season is now on, but the output will be comparatively light, as the dry weather has curtailed the crop. Then, too, there is a limited demand for canned artichokes, as it is a new product. The opening prices range from $1.30 to $2.95 a dozen for No. 2s, according to the number packed in the can. This vegetable is also packed in No. 2½ and in No. 10 cans.

Spinach—The California Packing Corporation has announced opening prices on spinach, and are guaranteeing these against their own decline until the end of 1924. This protection, with the outlook for a comparatively small pack, is expected to result in an early demand that will absorb all offerings. The opening prices are: No. 1s, $1.05; No. 2s, $1.20; No. 2½s, $1.50, and No. 10s, $4.85. These prices are the same as those announced recently by Libby, McNeill & Libby. The lack of rain has hindered the planting of the expected acreage and the crop is in poor shape in many places.

Tomatoes—Considerable interest is being taken in future tomatoes, and opening prices may be expected earlier than usual, according to some interests. Buyers are in the field soliciting acreage and are finding growers with rather upish ideas. Many

growers are holding out for $18 a ton, as compared with $14 and $15 a year ago, but no contracts are being signed at the higher price, as far as can be learned.

Exports Heavy—Heavy exports of California fruits, especially of the lower grades, continue to be made, and this fact is serving to strengthen the market. The steamer Kroonland, which recently left San Francisco for Europe, took a heavy cargo of canned and dried fruits to England, France and Germany. Stocks in canners' warehouses are getting low, and it is noted that there is now but little difference in the prices of canners putting out well-known brands and those whose products are comparatively unknown. Complete assortments are impossible to get, and almost every day some canner announces the withdrawal of something in his list. The cleanup is expected to be quite complete by the time the packing season arrives, and a heavy pack is in prospect if crop conditions prove satisfactory.

Salmon—The canned salmon market has not been especially active of late, but prices have been well maintained. Pinks have led in the demand, owing to the popular price at which this grade can be offered. From a statistical standpoint the situation is a very firm one, stocks of all grades having been reduced to comparatively small quantities.

E. A. Seaborg, supervisor of fisheries for the State of Washington, reports that the total pack of salmon for the year amounted to 970,693 cases. The Puget Sound district led, with 753,781 cases; the Columbia River district was second, with 171,596 cases, and Gray's Harbor contributed 45,316 cases.

Peaches—Producers of California cling peaches are planning to finance an advertising campaign to increase the demand for the canned product and representatives have been appointed to place the proposition before various canning interests. Arthur Coats will present the proposition to members of the Virden pool; Preston McKinney to members of the Canners' League of California; E. R. Williams to the Peach Association; G. W. Spencer to the California Co-operative Canneries, and C. G. Hamilton to the Southern California Canners' Bureau and the Southern California Peach and Apricot Growers. The acreage devoted to cling peaches in California is increasing at a rapid rate, and it is realized that some step must be taken to provide wider markets.

C. E. Virden, of the Virden Packing Co., recently announced that an additional payment of $5 a ton was made to growers on February 29 for peaches delivered in 1923. Growers who went into the Virden pool in 1923 were paid $20 a ton when deliveries were made, and it is announced that a total of $33 will be paid, so that $8 a ton is still due them. The pool represented about 20,000 tons.

Coast Notes—The Alaska Packers' Association is doing a great amount of development work on its Greater San Francisco terminal, and a huge basin has been dredged to a depth of thirty feet. Work will soon be commenced on one of the largest warehouses in the world devoted to food products, and this will be equipped with every facility for the rapid and economical handling of cargo.

Archie W. Shields, head of the Alaska Department of the Pacific American Fisheries, Seattle, Wash., returned recently from a business trip to Eastern points, and has since made arrangements for dispatching the steamship Catherine D. for Alaska waters. The company will operate six canneries in Alaska this year, and, under the name of the Annette Island Packing Co., will operate the plant on Annette Island which was purchased last year.

MAINE MARKET

Futures Selling Better Than Ever—Canners Rapidly Selling Out —Bantam Leading the Procession—Stringless Beans Also Selling Well—Potato Yields Cutting Corn Average — A Tribute to E. H. Brooks.

Portland, Me., March 7, 1924.

By "Maine,"
Special Correspondent "The Canning Trade."

FUTURES—Future corn is selling in much better shape than for several seasons. Buyers are covering their requirements in greater proportion than of recent years, and canners report their sales as nearly up to their estimated production. It is generally considered safe to sell up to 80 per cent of the average yield on whatever acreage may be signed, and this mark is now nearly reached. While a good acreage is assured the canners would all welcome better farming conditions which would allow them to increase acreage and thus enlarge their own volume of business.

The proportion of white and yellow corn is changing again this year, the demand for Golden Bantam being larger each season. This variety is strong at $1.70, as against $1.45 for Early Crosby.

Stringless Beans are also well on toward the safe amount of sales—in fact, canners are a bit wary about selling on the usual estimate this season, owing to the unaccountable weather and consequent short deliveries of the last two years. Futures are selling at $1.30 and $6.00.

Perhaps one reason why Maine corn acreage is sacrificed a little each year to other crops is the fact that the production per acre of potatoes in this State is very much higher than in any other section. A recent bulletin gives Maine credit for 258 bushels per acre, while the next best record, New Hampshire, is only 185, with the Northwestern States running at about 100. While the "corn belt" cannot be extended into new areas on account of frosts, the potato acreage can and does move into the corn-growing territory, until it is now almost impossible to find new canning factory locations in order to increase business.

Notes—While Mr. E. H. Brooks has retired from active work with the American Can Co., he can never be released from duty in the Maine canning business. Mr. Brooks came into Maine and the hearts of the Maine canners more than twenty-five years ago, and has truly been a factor in building up the local industry to the position which it now occupies. His experience has been wide and his information and advice have always been greatly valued. It was through Mr. Brooks' efforts that the American Can Co. built their large plant in Portland to take care of the fast-growing local business. Even now, in his so-called retirement, he is held to act in an advisory capacity, and will doubtless be called upon to function as usual when the active season opens. Certainly he can never "retire" from active interest, although his duties may be less arduous in the future.

"FIDDLING WHILE ROME BURNS"

(*Continued from page 10*)

Carolinas, none of which surpassed the up-bay "stuff" either in quality or quantity output.

Neither the men in the business nor the New Jersey State authorities are taking it for granted, as is my placid fellow-oysterman, Mr. Todd, that they will have beds available for centuries to come. Not at all! They have gone right down to hard work, both practical and scientific, to find a remedy to save their fisheries from the threatening fate of Northern waters—extinction.

Here in the Sinepuxent Bay we have never had a cull law, not being governed by the oyster laws of the Chesapeake Bay and tributaries. Twenty years ago approximately 8,000 acres were productive of oysters. Today it is doubtful if 50 acres are producing. This "gold mine" at that time boasted an oyster fleet that dotted the entire bay. Today the fleet consists of one sailboat and two pole scows, with an output not exceeding 1,000 bushels for the season. That is what lack of laws and absence of intelligently directed conservation and rehabilitation have done locally. Delegate Spence's plea for no legislation and "providential restoration" to the contrary notwithstanding.

With the destruction of public beds in this locality new methods had to be evolved. Those who remained in business had to plant shells, build up artificial beds or buy seed elsewhere. Unhappily most of the oystermen left the industry for other pursuits, while the surviving concerns have partially solved their problem by planting and farming their crops, not unlike the local agriculturists, though it is recognized now that the constructive action should have been taken long ago while it afforded opportunity for all. The Chesapeake should profit by our mistakes while it is possible to do so.

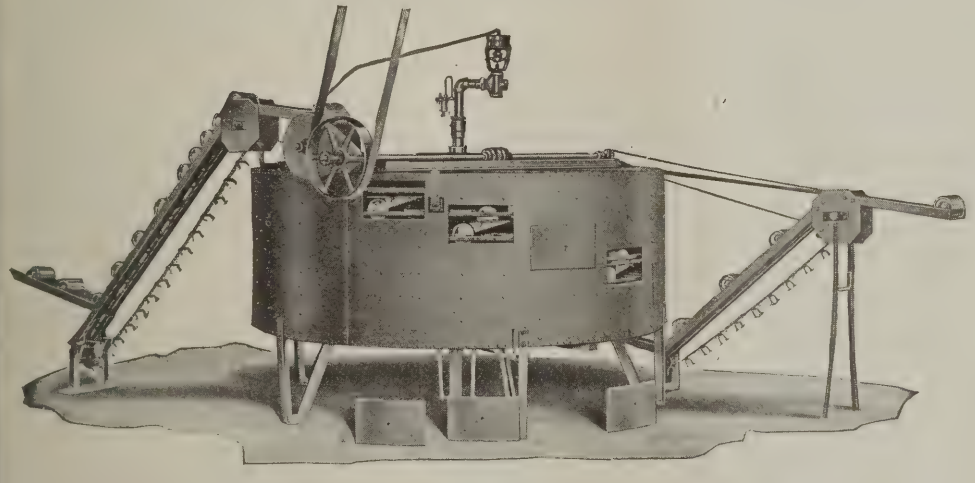
THE MORRAL CORN CUTTING MACHINE

Either Single Or Double Cut

THE MORRAL CORN CUTTING MACHINE is the most durable, simple and efficient cutter you can buy. It has the most positive feed of any cutter in use.

The Morral Cutter will cut large ears, nubbins and pieces of ears, without clogging like other cutters and for this reason you can secure a larger yield of cans per ton with the Morral Cutter than with any other type of cutter.

We furnish special attachments for the Morral Cutter for cutting Golden Bantam Corn and with these attachments the Morral Cutter will cut the Golden Bantam Corn more satisfactorily than any other cutter in use. If you have any cutters that you would like to replace with new and up to date machines let us know what you have and we will make you a liberal allowance for your cutters on the price of new cutters.



We make the MORRAL CORN HUSKER, either single or double and we also make the MORRAL LABELING MACHINE.

Our machines are guaranteed to do satisfactory work, or money back if they fail to do so when set up and operated in accordance with directions furnished.

It will pay you to write at once for prices and further information.

MORRAL BROTHERS, Morral, Ohio

THE SOUDER CONTINUOUS COOKER

Handles 2's, 2½'s and 3's without any change in Cooker.

These Cookers are built in three capacities; 325, 475 and 575 cans, with prices varying accordingly.

If interested in the Best Cooker on the market, let us give you more information regarding the Souder.

Souder Mfg. Co.
Bridgeton. N. J.

We also manufacture:

SANITARY FILLING TABLE, for open top cans.
WASHER for all fruits
QUICK SANITARY CAN STRAIGHTNER
WASHER and SCALDER for tomatoes
GRADER for tomatoes and beets.

CORING and SIZING Machine for pineapples
CHUCK and CUBE Machine for pineapples
RHUBARB CUTTER
FLIP Removing Machine.

SMILE AWHILE

NOT THAT KIND

The manager of a local hotel, recalling his novitiate as clerk employed in a country wayside house, relates that one morning a guest came downstairs and complained to the proprietor that he had not slept at all.

"I was troubled with insomnia," he said.

"Don't believe a durn word of it," said the indignant host. "Had the place cleaned out only this spring. Show me one, if you can! Show me one!"—Philadelphia Evening Bulletin.

FRANK, ANYWAY

Homesteader near Casper would like to meet lady that is willing to support husband. Write P. O. Box 270.—Want Ad in the Casper (Wyo.) Tribune.

THE END OF A FAD

"Do you believe in sleeping out of doors?"

"Not while I can pay the rent."—Boston Transcript.

HIS PAINFUL DUTY

In the Court House of an Eastern city is a melancholy attendent who, when asked to direct people to the Bureau of Marriage Licenses, inquires, lugubriously: "Do you insist?"

"Well, yes."

"Third door to the right."—Louisville Courier Journal.

TOO CLOSE

A negro went into a bank down South to get a check cashed. He stood in line a long time and finally his turn came. Just as he got to the window the teller put up a sign: "The Bank is Busted."

The Negro—What do you mean, the bank is busted?

Teller—Well, it is, that's all; it's busted—didn't you ever hear of a bank being busted?

The Negro—Yes, but I never had one bust right in my face before.—The Christian-Evangelist (St. Louis).

EDITORIALS

The last word in Convention reports has been said—our 'Steemed Contps. are both out—at last.

* * *

See where our old friend Ladd, he who put North Dakota very much on the map in the early days of pure food law effort—now Senator Ladd—is trying to pour water on the troubled oils at Washington.

* * *

"What is this country coming to?" cries an editorial writer. The answer is easy—to canned foods, after the big Canned Foods Week.

* * *

Truth tersely told: "If this industry (the canners) does not support Canned Foods Week, there certainly must be something wrong with their heads. It is absolutely the cheapest and the most effective advertising that canned foods have ever had," says a writer in a recent letter to us on this subject.

* * *

ARE NOT "MERCHANDISING" BROKERS—In the closing session of the annual Convention of the Brokers' Association, on Thursday morning, January 24th, Secretary Paul Fishback reminds us, there was an animated and interesting discussion of the question of the broker who merchandises speculatively in food products—i. e., one who buys and sells for his own account large quantities for the primary purpose of holding the merchandise for an increase in price and the resultant added profit. We are further reminded that there was no defense offered for the broker who indulges in this practice, the discussion centering principally upon a proper method for the Association to express its disapproval of this practice. A motion was offered that the Code of Ethics of the National Food Brokers' Association is amended to include a paragraph reading in effect that the broker who merchandises speculatively is unethical.

So the National Food Brokers' Association has gone on record as opposed to such practices, and its members are supposed to abide by its actions. This question has been aggitating the minds of a good many men in this industry, as it has also the wholesale grocers, and the above should be answer enough so far as all members of the Brokers' Association are concerned.

THE NEED OF CARE IN EXPORTING—The Foodstuffs Division of the Bureau of Foreign and Domestic Commerce has just received a letter from the American Consul at Calcutta, India, written to one of the Co-operative Associations in this country. From his letter it appears that entry was refused to a shipment of evaporated fruit since the containers bore no statement or indication of the country of origin, as required by the Indian Merchandise Marks Act.

It was only after some pressure had been exerted that these goods were finally permitted to enter. Occurances of this sort are frequently unfortunate, since serious financial loss may result, or, even worse, the foreign buyer may become dissatified with American goods and shippers.

The Bureau of Foreign and Domestic Commerce will be glad at all times to furnish information to respective shippers concerning tariffs, pure food or other similar regulations, and general information regarding the export trade.

PROPER CREDIT—Recently, in commenting upon the fine work done by various sections in connection with Canned Foods Week, we called attention to the good work of the Cincinnati Committee, and mentioned, in particular, the attractive circular gotten out by them, and in which we saw the fine hand of Wm. H. Gersie, of the United States Printing and Lithograph Co. We did not give this big label house as much credit, however, as it deserved, for they not only produced this exceptionally fine circular, but they did it at their own expense, and distributed it over a wide territory as their individual contribution to the good cause. If any canner had attempted to pay the bill for this he would have realized how advertising of this ad-

vanced sort runs into real money. It is one of the outstanding features of the 1924 Canned Foods Week, in which Cincinnati rated very high, if not at the top.

BUSINESS FLUCTUATIONS—In the early days of aviation we heard much more of "air-pockets," which often brought disaster to the airmen, than we do now; but it would seem that general business has been running into such air-pockets in recent months. These have happened so often during the past year that business men are beginning to think seriously about them. A period of active, intense buying will be enjoyed for a month or two, and then will suddenly slump off, and a like period of depression will ensue. Just as business begins to adjust itself to this new condition, buying will again come on and the brisk days will once more be felt. From the beginning of the new year until well after the Convention the canning industry was humming with good business; orders for spots and futures, and orders for machinery and supplies flying thick and fast. In the past fortnight or so this has seemed to all disappear, and we are now in one of those air-pockets to which we have referred. Why should this be, and what is the cause? No one seems to know, though, of course, there are plenty of opinions and explanations, but hardly any of them satisfactory. The canning industry is not alone in this; all other lines of industry are feeling the same effect, but with this difference. The canning industry, to use the vernacular, is "sitting prettier" than it ever did in its life before. The machinery and supply men have done a quite satisfactory amount of business to date, but, of course, would like to guard against the dilitory canner who puts off his needs until the last moment. And there is really no sense in the canners holding off, because they have made preparations for the 1924 pack, most of them have sold well of futures, and they will need the machinery and the supplies, and they know they will. Why not let the supply men have their orders now and so be sure of having them when wanted. Delay now will only cause them worry and possibly leave them without the machinery or the supplies when needed. But the machinery and supply men have a comfortable amount of business on their books which they will take care of, and they are not worrying, except to save the canner from trouble. That is that side of it. Then for the canners. It is said the buyers have quieted down—are not buying as they were, either of spots or futures. And there are those who intimate that it is time they quit on futures at least. Certainly as to spots the canners do not care when they start buying again; most of them have nothing to sell, and those who have know their value of the goods, and are not letting go unless the buyers meet their ideas. A wonderful situation when you think of it: futures well sold up insuring a good market for the 1924 packs; spots so well cleaned up that nothing can prevent clean decks before new packing time comes. No wonder the industry is "sitting pretty" and leaving the worrying to some other line of business. This industry has passed through its days of after-war dreariness and bleakness and come out into the sunshine of new and better business; and the big increasing consumption of canned foods makes it practically certain that the bright days will continue for many months to come. Other lines of industry may have their troubles—and we do not gloat over them by any means—but the canning industry is riding high.

DEMAND ONLY QUALITY CANNED FRUITS

SALES of high-grade canned fruit were good in Austria last year, says Assistant Trade Commissioner Prentiss M. Terry in a report to the Department of Commerce. The Austrian fruit preserving industry was unusually active, particularly in the manufacture of high-class jams, and a brisk demand for fine bottled goods among hotels and private consumers. Jams of only medium quality find a difficult market, and many Austrian factories engaged in the large scale manufacture of jams are still suffering from the general aversion which prevailed against them at the close of the war because of the very poor quality produced at that time. These large manufacturers complain of the lack of business.

RATE OF YIELD DECIDES THE PROFIT.

By the Soil Improvement Committee of the National Fertilizer Association.

MOST farmers figure their production on an acre basis—that is, so many bushels of corn or potatoes, so many tons of hay, so many bales of cotton per acre. Some are apt to lose sight of the fact, however, that in selling the crop that basis doesn't actually hold good. Corn is not sold by the acre; neither is hay. They are sold by the bushel and ton. So it is that often a man figures his costs on the acre basis, when as a matter of fact the acre cost may have little or nothing to do with the profit on the crop. Let us explain, first, with an instance provided by Mr. John Shutt and his son of Garrett, Ind., who grew potatoes on adjoining land last summer. The father used ordinary seed, 17 loads of manure and no fertilizer. The son used certified seed, green-sprouted, the same amount of manure and 475 pounds of a 4-8-6 fertilizer. Mr. Shutt got 75 bushels of potatoes per acre at a cost of about $1.13 a bushel. John got 227.6 bushels at a cost of 35 cents a bushel. Suppose the market had been one dollar. The father would have had to lose 13 cents on each bushel, while his son was making 64 cents on each of his bushels.

Another instance, also with potatoes, is furnished with the record established by J. S. Wile, Souderton, Pa., who has recently been accorded the championship among potato growers of that State. Mr. Wile produced 2,630 bushels on 5.9 acres, an average of 445.8 bushels per acre. On his best acre he grew 532.4 bushels. His average cost of production on the 5.9 acres was 27.2 cents a bushel, while on his best acre the bost was 22.8 cents per bushel. Thus, after attaining a rather abnormal rate of yield—445.8 bushels per acre—Mr. Wile, still further increasing the rate by 86.6 bushels, reduced his production costs by 4.4 per bushel.

Thus the difficulties connected with figuring costs on an acre basis seem apparent, especially when it is remembered that the crop must be sold on a bushel basis. It is often true that the expenditure of a little more money per acre will produce enough additional crop units to materially reduce the cost of each, and thereby insure profits even in unfavorable markets.

If potatoes or any other crop is going to be grown, enough thought, enough time, enough labor, enough money should be spent to insure that, when harvested, there will be enough bushels to share the total cost and provide a profit. That is a simple business proposition.

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER:

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 Quality.

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water–front enable us to give the Service required.

Our connection with closing machine manufacturers enables us to furnish the latest, speediest and best closing machine Equipment.

Can you see any reason for not letting us take care of your requirements in the manner you desire?

THE FLUCTUATIONS IN SUGAR DURING 1923.

SUGAR refiners in 1923 had all the ups and downs of a ten-year pre-war period, according to Earl D. Babst, president of the American Sugar Refining Co. The inventory of the company fluctuated as much as $2,500,000 in a single day, Mr. Babst states in his annual report made public today.

The price of raw sugar changed 115 times, he declares, and the extreme fluctuation of 3.375 cents per pound in raw sugar prices during 1923 was greater than the fluctuations of the entire ten years preceding the World War, in all of which time it was only 2.725 cents.

In the post-war disorganization of prices sugar went to greater extremes than any other basic commodity. Compared with the average prices of 1910, sugar's fluctuation since the Armistice is shown to have been greater than the combined fluctuations of wheat and cotton, and almost equal to the combined flunctuations of wool, rubber, coal and copper.

The year 1923 was unprofitable for cane sugar refiners, the report says, and the loss of $1,693,070.01 on 1,165,000 tons of raw sugar refined by the company during the year is ascribed by Mr. Babst to the 115 fluctuations of raw sugar prices. In 1922, he points out, the company refined 1,650,000 tons as a profit of $10,083,832.55.

Sales of the company totaled $200,000,000. Nearly 600,000,000 pounds of package sugar alone were sold.

The year opened with a declining market and a limited domestic demand for refined sugar, according to the report. England, the Continent and the Far East were in supply, and their markets quiet. Cuba was expecting a large crop. "These were reassuring conditions to the trade, in view of the even balance between production and consumption," Mr. Babst states, adding that "Out of this favorable and quiet start sprang a most sensational year."

Speculators Drawn to New York Market.—The Cuban crop by late January gave indications of disappointing results. "European buying of Cuban raws in competition with American refiners quickly became aggressive. Sharp price advances and fluctuations began to reflect these elements of increased consumption, decreased supply and active European competition. Publicity given to all these factors began to play upon the situation. Speculators were drawn from other markets, and soon the New York Sugar Exchange was doing a world business in sugar futures."

About the middle of February a regular official trade bulletin was issued from Washington, and, the report states, "immediately was interpreted as confirming the view that the needs of the world were larger than the prospective production." The Cuban statisticians, Guma-Mejer, almost simultaneously reduced their estimate of the Cuban crop. Soon the housewives' scramble was on, and retail grocers were limiting sugar sales to any one customer.

The inventory of the company fluctuated as much as $2,500,000 in a single day, Mr. Babst states. Raw sugar prices advanced faster than refined, owing to the competition of European buyers. Trade pressure had forced the refiners into a large business at little or no profit, and they were faced with inventory risks in the raw sugar purchased for replacement. The refiners endeavored to allay the public alarm and counseled the housewives to buy for the household in t customary way.

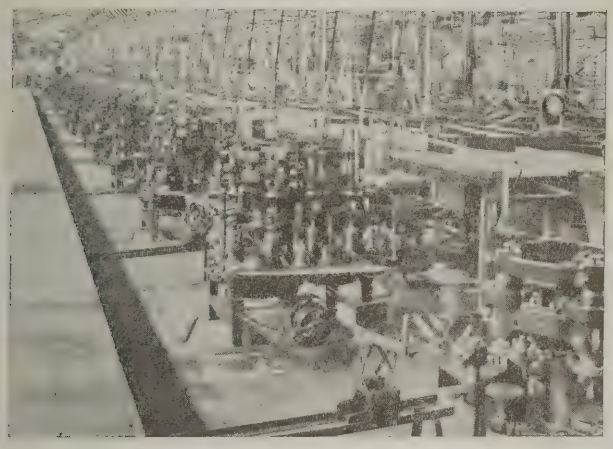
The Housewives' Boycott.—Investigations a court proceedings followed, culminating in a hous wives' boycott. "In a way," Mr. Babst says, "the bo cott was the outstanding economic feature of the ye for it succeeded in interrupting during the summer t even flow of supplies, thereby throwing greater pre sure on our invisible stocks of sugar.

"Between the scramble and the boycott the whc machinery of sugar distribution was turned tops turvy. We had an enormous demand with sensation price advances in the early winter, the season of sma est consumption, and a lack of demand with seve price declines in the summer, the season of greate consumption."

During the summer the United States refine were operating at little more than half their capacit in contrast with the heavy volume of meltings cu tomary at that time. The report states that this pr longed period of stagnation finally reduced domes supplies in the hands of the trade to a point where general demand arose.

The Cuban crop was now definitely known to reduced to about 3,600,000 tons, which was inadequa for the needs of the country in the fall. With t canning of a plentiful September fruit crop, household ers began to increase their purchases. Prices rose the end of September, approaching the high point the year, and with many flutuations remained at t higher level until the close of 1923.

Mr. Babst ponits out that "The refiner, as t connecting link between production and consumptic is most anxious to keep the streams of sugar from t tropics flowing steadily, free from all artificial r straints, free from crusades and free from illegitima speculation."



The development of exports is regarded by M Babst as a necessity for the maintenance of Cub expanded production. He calls attention to the fa that the 2,000,000 ton gain in European sugar produ tion in the last four years has been almost as large the eight-year gain of the United States field und war pressure. The United States field comprises, addition to domestic beet and cane, the production Cuba, Hawaii, Philippines, Porto Rico, Santo Doming Hayti and the Virgin Islands. Mr. Babst remar that "there is bound to be a race for the sugar marke of the world."

The wholesale price of refined sugar in the Unit States during 1923 is shown by the report to have be lower than the price in England, France, Spain, Ita Holland, Norway, Canada or Uruguay. The price sugar last year, compared with the average price fro 1890 to 1899, indexed at less than 180, according to t report, while the composite average price of milk, egg butter, bread and potatoes indexed at more than 215.

The food value obtainable from sugar for one ce in 1923 is shown to have been 214 calories, compar with 174 for bread, and for meats like pork 115, be 69 and fowl 27. Dairy products like cheese, milk a butter yielded only 80, 79 and 72 calories, respectivel for one cent, according to the report.

"In 1918," says the report, "we started to chan the 12-hour shift then prevailing in the sugar refini industry to an eight-hour shift. This change was ma gradually and still continues to be a step in advance most of our competitors."

A New Hypothesis of Perforations[1]

By E. F. Kohman

Research Laboratary National Canners Association

Washington, D. C.

(1) Address given before the Northwest Canners Association, Portland, Oregon, January 3, and the Fruit Section of the National Canners Convention, Buffalo, January 23. A scientific article on this subject is given in the Journal of Industrial and Enginneering Chemistry, March, 1924.

IN OUR discussion of perforations we may include hydrogen swells and hydrogen springers. These three types of non-merchantable cans all belong in the same category, since the fundamental chemical reaction which causes them is similar. We may call this chemical reaction by various names. It may be termed corrosion, solution or exidation of the metal in the can with or without the formation of hydrogen. Whatever the cause of this corrosion, whether it is a defective seam, a breathing gasket, defective tin plate, a large amount of oxygen in the fruit, an inadequate exhaust to eliminate this oxygen, too great a head space, or whether it is due to storage in warm climates, in every case the fundamental chemical reaction involved is one in which the individual atoms of iron and tin are oxidized and changed to the ionic form. In other words, they are robbed of two negative electrical charges known as electrons, leaving them with two excess positive charges of electricity. This introductory remark addressed to an audience of canners should be accompanied by an apology for the use of chemical terms were it not for the purpose of emphasizing the necessity of one investigating this problem to consider it in all its chemical aspects and details as well as the technical phases.

This reaction, as stated above, is commonly known as oxidation. In one sense, oxidation is an apt expression because it indicates oxygen, and, as will be seen later, oxygen may be a decided factor in bringing about perforations, hydrogen swells and springers. However, this may be misleading, because oxygen is not always directly involved. If Smith owes Jones $100, he may fulfill his obligation by handing Jones a $100 gold piece. He is more likely, however, to write him a check. This check has no intrinsic value, as Smith may tear it up and write a second one, and no one will be the poorer for it; yet, when Smith accepts it, he credits Jones for having fulfilled his obligation. This is due to the fact that somewhere or other the check is backed by gold or its equivalent. In an analogous manner we may have oxidation of the metal in the tin can without oxygen being directly involved, even though the same fundamental oxidation reaction always takes place.

There are a number of possibilities when one begins to consider the different substances which may be factors in this oxidation. Acidity is commonly regarded as being the primary cause of perforations, hydrogen swells and springers. There are several reasons, however, why we must conclude that this is not the primary cause. A simple reaction between a metal and an acid always evolves hydrogen in proportion to the amount of metal and acid reacting, but in the problem we are discussing there is no definite parallelism between the acidity (hydrogen ion concentration) of the fruit and the formation of perforations, hydrogen swells and springers, nor is there any close relationship between the amount of metal going into solution and the amount of hydrogen formed. For example, we have seen gooseberries packed in May in No. 2 plain cans, and by the following August a considerable proportion had become hydrogen swells, but the cans gave no appearance of being badly corroded. On the contrary, we have seen rhubarb also packed in May in No. 10 plain cans, and by the following August most of the tin appeared to be stripped from the plate, but there was no trace of hydrogen in the cans. We may, therefore, reasonably expect to have perforations with a great variation in the amount of hydrogen formed. In other words, we may have perforations occurring with only a limited amount of swells and springers, or we may have swells and springers develop without any appreciable perforation.

Furthermore, the least acid fruits are by no means the ones which give the least trouble. For example, the Bing cherries, grown in the Northwest, are among the least acid of the fruits commonly canned, yet perforations occur so early after pack that canners will not risk putting Bing cherries in ename cans. As an illustration, some experimental packs of Bing ch ries canned in July are now—six months later—between 20 50 per cent perforated. It is no uncommon experience for per cent of them to perforate within a year. The oxygen c tent of these cherries is not high as compared with other fru and removing it by means of a vacuum does not appreciably duce their tendency to perforate.

A consideration of the different action of fruits in plain enamel-lined cans presents some suggestive features. The gr bulk of perforations as well as hydrogen swells and spring occur in enamel-lined cans. In most instances the same kind fruit is not packed in both types of cans, but this would h true even if such were the practice. This behavior has b explained with the theory that in the enameled cans the act is concentrated on the small areas where there is a break the enamel. To give significance to this idea, one must assu that when spread over the entire area of a plain can, the act agent is spent before much injury results. In other words the acid is the primary factor, then we must assume that i plain can, where the action is spread over the entire area of can, the acid is spent before much injury results. But the acid of fruits is spent in no such manner, whether canned in plain enameled cans. We must, therefore, look for other factors t acidity.

We believe there are in the fruit some substances other t acids which in actual commercial practice are very import factors in determining the extent to which the fruit corro the can. It seems probable that their amount varies grea particularly in the fruits after canning due, in part, to va tions in the manner of handling. In some fruits which p forate enameled cans badly, but not plain cans, the quantity these substances must be relatively small if we explain this ference to be due to their action all being exerted on the sm areas not protected by the enamel in the enameled cans. following data is presented to show that oxygen acts in s a manner in causing perforation, hydrogen swells and hydro springers. We do not wish to imply that the idea that oxy is a factor in this respect is new. It has often been mentio in this connection. Sellers patent[2] for removing the oxy from apples previous to canning by means of a vacuum is ba on this. But the data here presented analyzes the effect of o gen and the nature of its action in a way that it should thr some light on this important problem.

In a preliminary experiment, York Imperial apples w peeled, quartered filled into the cans without water and subjec to a vacuum of 28 to 29 inches three successive times, and vacuum was released each ime with oxygen, as described i previous paper.[3] The apples so treated were then divided i two lots, one of which was given no exhaust before canni while the other was given a two-minute exhaust in boiling wa These two lots are represented, respectively, by Curves I and in Figure I, where a slight effect of the exhaust is shown delayed perforations.

But the striking thing in this experiment is that at the sa time apples were also filled with nitrogen instead of oxygen a perforations have not occurred up to the present time afte period of forty-five weeks, although there are now 16.6 per c springers and swells among them, most of which formed af the oxygen-filled apples had practically all perforated.

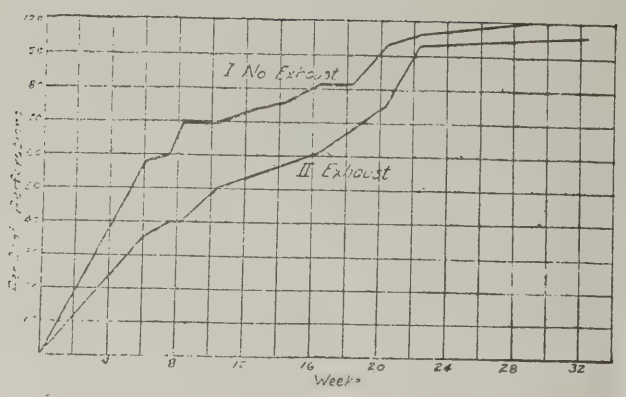

FIG. 1—PERFORATIONS WITH OXYGEN-FILLED APPLES, HELD AT 37° C. (99° F.). NITROGEN-FILLED APPLES CANNED AT THE SAME TIME FORMED NO PERFORATIONS, SWELLS, OR SPRINGERS UP TO 40 WEEKS. BETWEEN THE 40TH AND 45TH WEEKS 16.6 PER CENT SWELLS AND SPRINGERS DEVELOPED

In this experiment, as well as the succeeding one represented by Figure II and described below, No. 2 enameled cans were used and the canned apples were stored in an incubator at approximately 37 C. (99 F.) for the greater part of the time. For three short intervals, adding up to a total of four weeks, the incubator had to be used for another purpose. Because of the higher temperature of storage the action on the can was more severe than would have been the case in commercial practice.

Figure II represents an experiment with yellow Newton apples with which a greater number of variations in oxygen content was employed and a different lot of cans used. The 80 per cent oxygen curve represents apples peeled, quartered and subjected to a vacuum of 28 to 29 inches three successive times, the vacuum being released each time with oxygen. After this treatment the gas in the apples was found by analysis to be 80 per cent oxygen. The 32 per cent oxygen curve represents apples subjected to a vacuum of 15 inches but once, the vacuum being released with oxygen. The 13 per cent oxygen curve represents untreated apples. The nitrogen and the carbon dioxide curves represent apples subjected to a vacuum of 28 to 29 inches three successive times, the vacuum being released each time with nitrogen and carbon dioxide, respectively. The curve designated as "soaked" represents apples peeled, quartered and held under a 2 per cent salt solution for 16 to 18 hours at ordinary temperature. This is a practice developed commercially by apple canners canners to prevent the apples from darkening slightly during process. This discoloration is due to their oxygen content. oxygen is consumed by the respiratory processes in the app during the soaking period. The salt solution prevents additio oxygen from the atmosphere from diffusing into the apples the salt apparently functions in preventing peroxidase discol ation on the surface of the pared apples. After this prelimin treatment the various lots of apples were all canned in the sa manner with a two-minute exhaust in boiling water and a fi minute process.

In Figure II there is brought out a striking relations between the quantity of oxygen in the can and the rate of l due to perforations, swells and springers. In round numbe the apples in a can contained 55 cc. of gas (about 2 ounce irrespective of its composition, except in the case of the carb dioxide-filled apples, from which we obtained about 85 to 90 per can by our method of analysis. This was probably due t considerable amount of carbon dioxide dissolving in the app as well as filling the intercellular spaces. It may be of inter to state that apples when subjected to a vacuum repeatedly of contact with water will take in, when the vacuum is releas approximately the same volume of gas that was withdra Most fruits, however, will suck in their own juices to a la extent, and it is, therefore, impossible to replace the gas in th with an equal volume of another gas, as is the case with appl Moreover, we have evidence that the removal of oxygen vacuum does not reduce perforations and hydrogen format with other fruits as it does with apples, indicating that in th there is a substance other than oxygen, but whose effect is si ilar to that of oxygen.

In order to obtain a closer insight into the nature of action of oxygen in canned fruits, we made an analysis fr time to time of the gas in the six lots of canned apples rep sented in Figure II. For this purpose a separate pack was up from the same apples and the same methods were used. T data is presented in Table I. In a previous publication[3] showed that the disappearance of oxygen in canned fruits is to its combination with the metal of the can. Since the a of metal exposed in enameled cans is likely to vary great the rate of disappearance of oxygen must vary likewise in in vidual cans. We give, therefore, the individual determinati as being more significant than averages. As the apples, af filling them with the various gases, were exposed to the air a short period during which the cans were filed with water, t tendency of the carbon dioxide to go into solution during t interval of exposure would cause an equivalent amount of to be sucked in. To the extent that this occurred, certain ca among the carbon dioxide-filled apples would contain more and, therefore, more oxygen than the nitrogen-filled or soak apples.

* Examined immediately after canning, before processing.

– Examined immediately after processing.

The data in the table indicates that the oxygen disappears about as soon in the cans containing the larger amounts as in those containing the smaller irrespective of the amount originally present. As soon as the oxygen has disappeared, hydrogen begins to form, and the rate at which it forms is in the same order as the amount of oxygen originally present. The fact that hydrogen and oxygen was found in some cans at the same time is probably due to the fact, as we have previously shown [3], that oxygen may remain in small amounts within the apples, even for considerable time after it has all disappeared in the headspace, where hydrogen may be forming in the meantime. The finding of hydrogen in some of the cans containing carbon-dioxide-filled apples earlier than in the nitrogen filled or soaked apples, as is indicated in Table I, is in harmony with our explanation that with the former the oxygen was less efficiently excluded, though the evidence with these three lots bearing on this point is rather limited. In some of the cans containing carbon-dioxide-filled apples we obtained as low as 3 or 4 cc. of nitrogen, whereas those in which hydrogen was found there was about 10 cc., which originally no doubt was accompanied by a proportionate amount of oxygen.

The following data, relating to soaked, nitrogen-filled, normal and oxygen-filled apples packed in plain cans is presented as a contrast to and a comparison with the same products packed in enameled cans and considered under Figure II and Table I. These four lots of apples were canned in the plain cans precisely as in the enameled cans, approximately the same time, but for another purpose for which they were shipped to New York. There, before they were opened, one can of each lot every other day during two different periods, the vacuum was taken. The average for from 22 to 30 cans per lot for each period are recorded in Table II. In considering these figures it should be borne in mind that immediately after canning all four lots had approximately the same vacuum ranging from 4 to 5 inches within each lot. The high vacuum of the oxygen-filled apples developed within a few days after canning coincident with the disappearance of oxygen.

The original oxygen content of the four lots of apples represent in Table II can be seen in Table I.

TABLE II.

Average Vacuum (in Inches) of Apples Packed in Plain Ca With Varying Oxygen Content.

Preliminary Treatment of Apples	Soaked	Nitrogen-Filled	Untreated	Oxyge Fille
Opened 7 to 17 weeks after canning..	3.1	3.0	4.5	19.0
Opened 31 to 38 weeks after canning.	4.4	3.2	4.7	15.0

About 38 weeks after canning some of these canned appl were reshipped to Washington and the gas in them analyzed, a a determination of the iron and tin in the contents made. Hydr gen was found in about half the cans examined, ranging fr 0.4 cc. to 1.6 cc. per can, irrespective of the preliminary trea ment that the apples received. The average of the iron and t determinations of the contents representing four cans for ea lot are given in Table III.

TABLE III.

Average Iron and Tin Content of Apples Packed in Plain Ca With Varying Oxygen Content.

Preliminary Treatment of Apples	Milligrams per Kilogra Iron	Tin
Soaked	70	41
Nitrogen-filled	49	48
Untreated	60	140
Oxygen-filled	121	513

It should be stated that 30 mg. of the iron given in the tab was originally in the apples, the remainder only coming from t can. Also that the iron content in the individual cans of the san lot of apples varied greatly. For example, one can of the ox gen-filled apples contained only 33 mg. iron per kilo., which about the amount contained by the apples before canning. Wi respect to the tin content, however, the individual cans fall three well-defined groups, the soaked and nitrogen-filled appl

SPRAGUE-SELLS

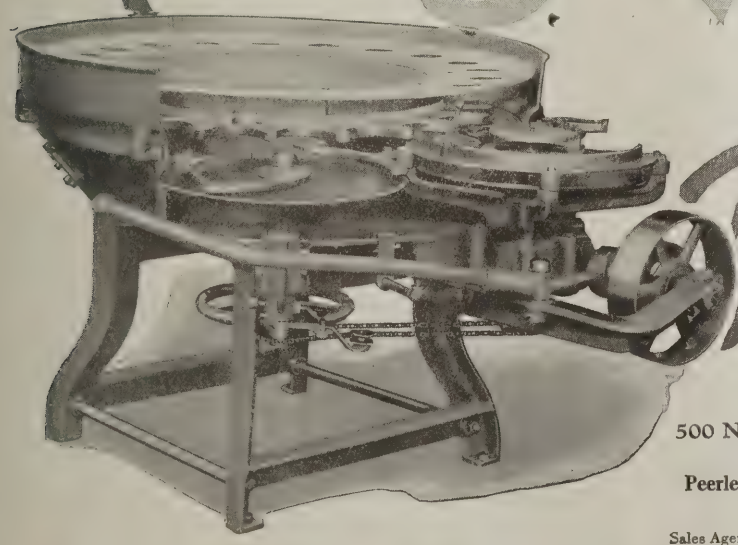
Sprague-Sells Hand Pack Filler
(Semi-Automatic)

Hand Pack Quality at Machine Pack Cost

Four girls and this machine will fill 36,000 cans in ten hours and equal the quality of a strictly hand-filled pack.

The only machine that positively will not cut, squeeze, or bleed your tomatoes.

Tomatoes that are thoroughly ripe are handled on the Sprague-Sells filler and placed in the cans without any bleeding or crushing whatever.



Strictly Sanitary—Easily Cleaned.

All parts coming in contact with product are finished with baked-on, acid-proof enamel. No trick at all to clean machine frequently—suitable drains are provided—and but a few moments work is required to thoroughly flush it out.

Ideal for the general line plant.

Fills tomatoes, kraut, pickles, string beans, beets, fruits, berries, etc. and can be furnished adjustable for No. 1 to No. 3 cans. Specially built for No. 10's if desired.

Our machines are guaranteed to satisfy you—your money back if they fail to do so.

HAND PACK FILLER

This advertsment is published jointly by the Peerless Husker Company, Inc., Buffalo, N. Y. and the Sprague-Sells Corporation, Hoopeston, Illinois

constituting one, the untreated and oxygen-filled apples, respectively, the other two. It is possible that there is significance in the difference between the averages of the soaked and nitrogen-filled apples, but as there is some overlapping in individual cans, more data is necessary to establish it.

It should not be inferred from the favorable results obtained with apples subjected to a vacuum and filled with nitrogen that this is advocated as a practical method. It was used here as an experimental means of arriving at facts. There is evidence that this is not as efficient in eliminating oxygen as the soaking method that was used. One point of difference is the fact that the nitrogen-filled apples, upon extending the cook, became somewhat darker than the soaked apples. The nature of this difference is being studied.

A consideration of what happens in such a soaking process is of interest. It should be borne in mind that all fruits continually use oxygen and give off carbon dioxide. This is a normal respiratory process very similar to our own breathing. Since in soaking their supply of atmosphere oxygen is cut off by their being immersed in the salt solution, they completely use up the oxygen held within their tissue.

It is not likely that this respiratory process is as simple as a direct conversion of oxygen into carbon dioxide. In our own respiratory process the oxygen first combines with the haemoglobin of the blood to form oxyhaemoglobin. This combined oxygen still has its full oxidizing powers, and as such is transferred to all parts of the body. If there is any such intermediary substance in fruits in which oxygen is held in combination, this would be used up during the soaking process, as well as the gaseous oxygen, but it would not be removed by a vacuum pump.

We may carry the analogy between our own respiratory system and that in fruits further in considering the effect of the exhaust for fruits. If a man is submerged in water, he looses consciousness in a few seconds, but he may be revived after being submerged several minutes. During this time he utilizes the oxygen in his blood in the form of oxyhaemoglobin. But if he were submerged in boiling water, he would be killed instantly, and this oxyhaemoglobin would not be utilized. The heat of the exhaust box for fruits drives out some of the oxygen in the fruits, but until boiling temperature is reached—and this is never reached in canned fruits—the last traces of oxygen are never driven out. If the temperature of the fruit is raised so rapidly as to kill it before these last traces of oxygen are used up, it will be available to operate in bringing about perforations. This argues in favor of a long exhaust at a relatively low temperature, rather than a short exhaust at a high temperature. It has been customary to measure the efficiency of an exhaust by taking the temperature of the can contents at the time of closure. This is rather a measure of the vacuum that will be obtained in the finished product. By considering at the same time the length of the exhaust which was necessary to secure that temperature and vacuum, one has a fair measure of the efficiency of oxygen elimination.

The following table by Magness[4] shows the effect of storage temperature on oxygen content:

TABLE IV.

Effect of Storage Temperature on Oxygen Content in Yellow Newton Apples.

Temperature of Storage Degrees F.	Per Cent Carbon Dioxide	Per Cent Oxygen	Per Cent Carbon Dioxide Plus Oxygen
36	6.7	14.2	20.9
43	8.4	12.9	21.3
52	12.2	10.7	22.9
68	17.2	5.5	22.7
86	21.4	3.2	24.6

This brings out in a striking manner that the increased respiration at the higher temperature depletes the oxygen in them and converts it into carbon dioxide. It should be observed that one volume of oxygen gives rise to an equal volume of carbon dioxide, and that the sum of two in the apples is relatively constant.

Table V gives the analysis of the gas in strawberries as found in Salem and The Dalles, Oregon and in Vancouver, Washington, as they were used for canning. It is seen that certain varieties of berries contain much more gas than others. But if the data in Table IV is recalled, it is evident that there may be great variation even in the same variety even in the same canning factory because of temperature variations. For example, berries grown in the Hood River Valley, at the foot Mount Hood, may be chilled during the night and arrive canning in the morning at the Dalles for canning at a fa low temperature. It is not unusual for the temperature at Dalles to be 95 F. in the shade during the strawberry cann season. Held at this temperature during the day, the ber may have a different oxygen content in the evening than in morning. This same consideration holds for strawberries h over in cold storage for canning.

TABLE V.

Gas in Strawberries

Clark[5] has reported some results on the effect of salt perforations in canned apples, in which he points out that if canned apples were grouped in the order of their salt cont the number of perforations were in the same order. The va tion in salt noted by him was a result of the variation in handl which may have had some influence on the results obtained. results are based on apples canned in plain cans.

In order to obtain the effect of salt on perforations in ena eled cans, to determine not only the action of salt in particul but of an electrolyte in general, we made the experiment rep sented in Figures III and IV, in which there are three lots apples. In Figure III only perforations are represented, wh in Figure IV hydrogen swells and springers as well as perfo tions are included. The apples in one lot, represented by upper group of curves, were filled with oxygen; the apples o second lot, represented by the lower group of curves, had th normal gas content; the apples of the third lot not represen on the charts because no perforations, hydrogen swells or spri ers had occurred up to the time of writing (42 weeks after c ning), were filled with nitrogen. In canning each of these th lots, water containing varying amounts of salt was used so t the total can contents had the per cent of salt indicated on chart. With the exception of these two variations, the app were canned under as uniform conditions as possible and sto at ordinary temperatures.

The effect of oxygen is so great in this experiment that tends to overshadow any influence of the salt. It does not se possible to distinguish between the varying percentage of s Possibly as the nitrogen-filled apples are held over an extend period the action of the salt will be more noticeable.

The question presents itself as to what causes variation the proportion of cans which become hydrogen springers swells before perforating. When a springer develops and can also perforates between examination intervals, and the e of the can, of its own accord, assumes its original position, fact that it had been a springer would be unobserved. For t reason, when perforations are occurring so rapidly, as was case with the oxygen-filled apples, some springers escape obs vation, even though the cans are examined every two wee With the experiments held in the incubator, represented in F ures I and II, there were practically no springers or swells served among the oxygen-filled apples, and the number obser with the other lots was in the reverse order of the oxygen c tent. This relationship is more evident in the experiment rep sented in Figures III and IV. A comparison of these two cha reveals the fact that few swells and springers were obser among the oxygen-filled apples, but with the untreated app containing less oxygen there were decidedly more. This brought out more clearly in Table VI. The date is given, incl ing only 28 weeks, because at the end of that time most of t oxygen-filled apples had perforated and the percentage of sprin ers and swells could not materially increase. Moreover, at th time their formation in the other lots was temporarily arrest

Automatic Strip Feed Press

ARRANGED WITH CURLING AND STACKING MACHINE

We illustrate one of our several types of Automatic Strip Feed Presses equipped with direct connected Curling and Automatic Stacking Machine used for producing sanitary can ends.

This equipment comprises a complete unit for the rapid production of all sizes of sanitary can ends up to No. 3, or similar work requiring a curled edge after leaving Press. A larger size unit is supplied for No. 10 can ends.

The Automatic Stacker is designed to be placed adjacent to any of our various end producing machines where it is desirable to stack the ends as discharged. All or any part of this machinery is furnished to meet your requirements and may be operated separately or attached to your present equipment.

(Further particulars, upon request)

due to the contraction of the can contents with the advent of fall weather.

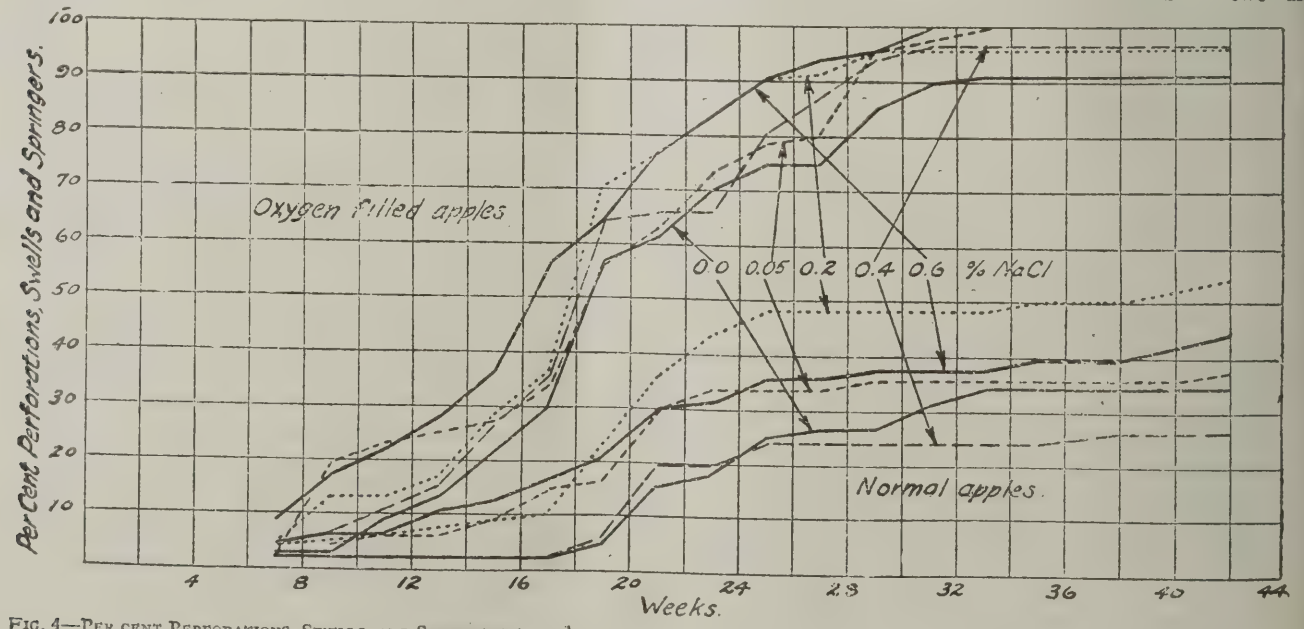
TABLE VI.

Per Cent Hydrogen Swells and Springers from Apples of Varying Oxygen and Salt Contents.

Per cent salt in apples	0.0	0.05	0.2	0.4	0.6
Springers and swells from nitrogen-filled apples	0.0	0.0	0.0	0.0	0.0
Springers and swells from untreated apples	28.0	29.2	41.7	23.9	29.2
Springers and swells from oxygen-filled apples	19.6	20.8	27.7	17.4	21.3

a hydrogen acceptor, we can have corrosion taking place wi hydrogen formation. The anthocyan pigments, the fruit c are such possibilities. It is a known fact that colored fruit bleached in plain cans and that frequently the color can b stored by the action of the oxygen of the air. This indi these colors may be oxygen carriers.

There is a limited amount of data to show that ce fruits tend to form a larger per cent of springers and s before perforating than others. In the above experiment assume that before hydrogen began to form the oxygen cor the can to a considerable depth either by attacking the can or by combining with the present hydrogen and thus actin a depolarizing agent. Extensive experiments published this laboratory[6] with cider and blueberries in two diff



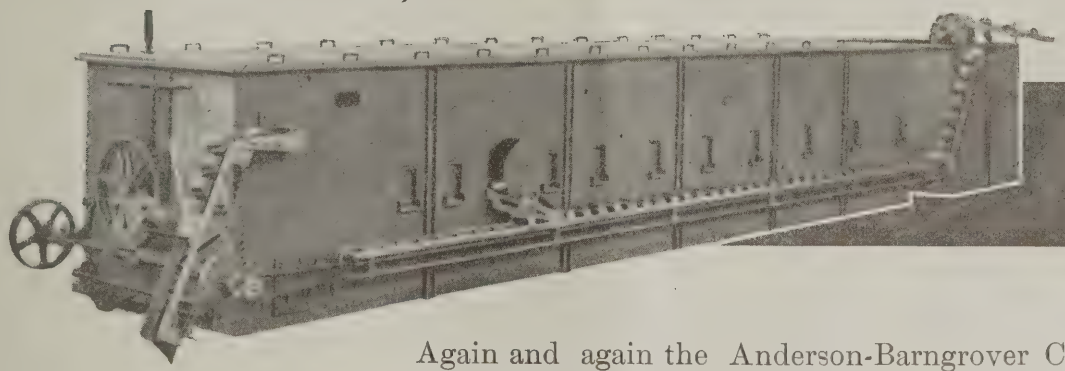


FIG. 4—PER CENT PERFORATIONS, SWELLS, AND SPRINGERS FROM APPLES OF VARYING OXYGEN AND SALT CONTENT HELD AT ORDINARY TEMPERATURES. NITROGEN-FILLED APPLES WITH THE SAME SALT CONTENT HAVE SHOWN NO PERFORATIONS, SWELLS OR SPRINGERS TO DATE (42 WEEKS).

A relatively high vacuum has been advocated to lessen the tendency to formation of swells and springers. In the experiments here recorded the question is somewhat complicated by the higher vacuum developed after canning in those apples originally containing oxygen due to its subsequent disappearance. This vacuum would take care of the hydrogen formed for a certain period. But if there is oxygen in solution or in a combination somewhat analogous to that in oxyhaemoglobin, or if there is present in fruits a non-oxygen-bearing oxidizing agent, i. e., years indicate that cider consistently forms more springers swells than blueberries. Moreover, general observations lea to believe that certain products consistently corrode the without hydrogen formation to a greater extent than others. do not wish to imply that this means, for example, that blueber necessarily contain more oxygen than cider. Rather, we take suggest that fruits contain other oxidizing substances which

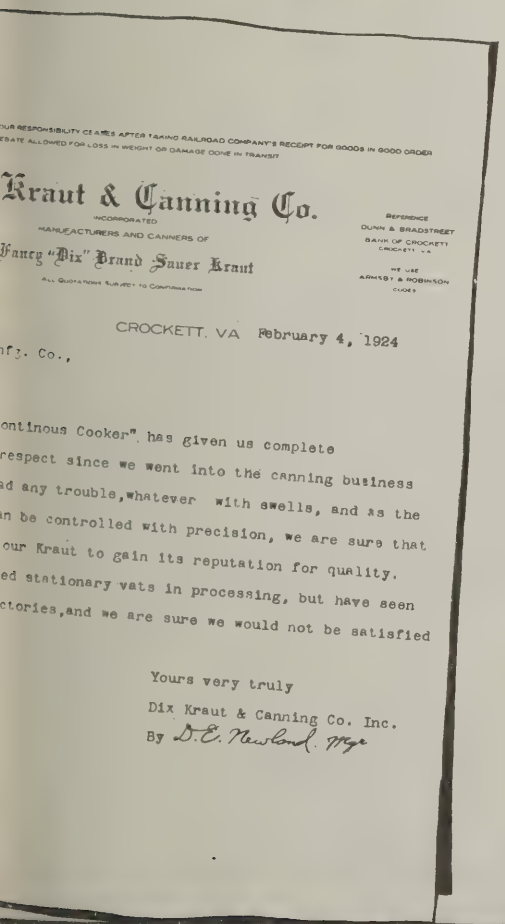
ITATING COOKING and COOLING

oduces *Perfect* Cooked Foods Unsurpassed *Uniform* Appearance



Again and again the Anderson-Barngrover Continuous Agitating Cooker has emphatically proven its ability to deliver unmatchable cooked foods as the indisputable proof we hold over authorative signatures shows.

For them A-B Continuous Agitating Cookers put quick, uniform heat penetration into every can thereby conserving nature's own color and appearance–nature's own flavor.

Coolers of similar design make sure the cook is stopped before the cans are stacked, eliminating the uncertainty of air cooling.

With every cooking expense largely economized, some entirely eliminated, A–B units give their users a finer product, at enough less cooking expense to return them the initial cost – in other words, their Cooker cost them nothing.

Are you looking for a good cooker for nothing ?

YOU OWNED ONE

in a manner similar to oxygen. We believe that the amount of these substances in the canned product is dependent not only on the amount originally present in the fruit, but also on the method of handling. Also, it is not improbable that the same procedure with different fruits has different results.

The fact that when apples containing oxygen are canned in plain cans the oxygen very promptly disappears and hydrogen is very slow to form, and in many cans does not form at all for a considerable time; whereas, when apples with the same amount of oxygen are packed in enameled cans the oxygen disappears much more slowly, but after it is gone hydrogen promptly forms, we take as evidence that tin plate offers some resistance to the action of the acid alone, but under the combined action of acid and oxygen this resistance is greatly weakened. When once this resistance is broken down, as apparently is the case in the enameled cans, where evidently the oxygen corrodes to a greater depth than the same amount of oxygen in plain cans, the acid continues to act upon the metal until perforation results. The more rapid formation of hydrogen with the larger original oxygen content may mean that a larger area has been laid bare to the action of the acid.

We have no data at present to throw much illumination on the nature of this protection. It may be merely foreign matter, such as an oily film, or it may be a physical condition, such as polarization. But we should not exclude the possibility that it may be something more substantial, such as a thin film of an alloy, or alloys of tin and iron. The gelatin test indicates that iron is exposed in certain spots on tin plate, but this may be iron in the form of an alloy which is subject to the attack of hydrochloric acid, but not of the fruit acids. We are aware that some do not believe iron and tin alloy in the process of tin-plating, but do not regard the evidence on this point to be conclusive. This protection is somewhat injured by the bending of the tinplate in the process of closing the can, since it is at the countersink that most perforations occur. But it is by no means completely broken. Any data which will throw light on the nature of this protection is desirable, as it should be suggestive of means to increase it.

Finally, we wish to point out what we regard as a misconception of what constitutes a "good" exhaust in the commercial canning of fruits. A common criterion is the temperature of the can contents at the time of closing. But a simple application of Charles' gas law will reveal the fact that a rise in temperature of the fruit from 65 to 190 F. will drive out, by expansion, only about one-fifth of the gases in them, including oxygen. This can be of little significance if oxygen is an important factor. A greater factor than this is the increased water vapor pressure which crowds out an equivalent amount of oxygen. But both of these factors leave a considerable residue which must be eliminated in another way. The beneficial effect for this residue is to be sought in another feature, namely, in increased respiration of the fruit due to securing an appropriate temperature. A good exhaust is one, therefore, which, by respiratory processes, consumes the oxygen within the fruit most effectively, and possibly other oxidizing substances that the fruit may contain. According to this viewpoint, the temperature of the fruit may be raised so rapidly so to kill the enzymatic reactions before they have accomplished the maximum good. When once the respiratory processes are destroyed by heat, one of the most effective means of oxygen elimination is lost.

There are some striking evidences of harmful effects from a too rapid rise in temperature. It is well known that if the soaking of apples is conducted at too high temperatures, the centers become darkened. With some varieties this occurs as low as 130 degrees F. When some varieties of strawberries are canned immediately after being taken from cold storage, the oxygen content is high, due to inhibited respiration at the low temperature, and unless this is eliminated by an adequate exhaust it is a factor in deadening the brightness of the color during the process.

There is no data available which enables us to say at what temperature the respiratory processes in fruits are destroyed. It undoubtedly varies with conditions and variety of fruit. Moreover, variable factors are always at play, control of which is difficult and often impossible. Different sets of conditions may give what on the surface appear to be contradictory results. It is of the utmost importance that these conditions be clearly understood.

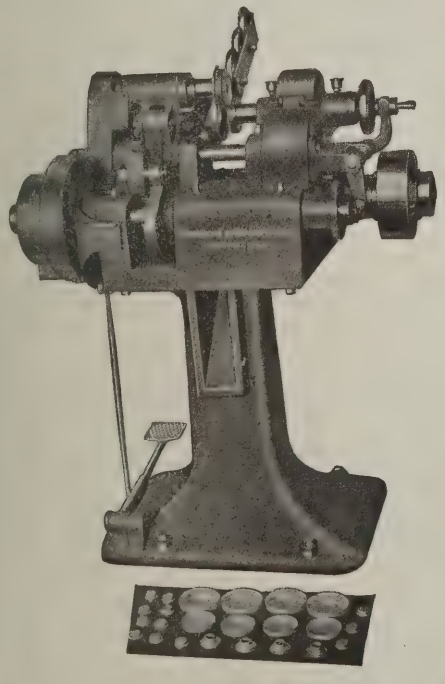
The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.



For the canner who wants individual motor drive we can attach ½ H. P. Motor.

VIRGINIA CANNERS HOLD LARGE MEETING.

THE fourteenth annual convention of the Canners' Association of Virginia convened in the assembly room of the Chamber of Commerce, Roanoke, Wednesday, March 5th.

The largest number of canners attending a convention in the history of the organization were present at the meeting. A great deal of enthusiasm was manifested and some unusually good addresses were delivered by the speakers on the program.

At noon the canners were the guests of the Virginia Can Co. and Bedford Can Co. at luncheon.

Members of the Board of Directors were elected as follows:

For the three-year term: R. A. Gilliam, W. G. Spigle, B. R. Ikenberry, Lester Pendergast and H. D. Moyer.

For the two-year term: J. W. Gillespie, A. L. Murray, G. S. DeLong, M. F. Sink and S. R. Price.

For the one-year term: Miller Overstreet, S. W. Huddleston, F. W. Brugh and H. M. Booze.

Following the adjournment of the convention the directors met in special session and elected the following officers: President, B. R. Ikenberry; secretary-treasurer, W. G. Spigle; vice-presidents, S. R. Price, S. W. Huddleston and Lester Pendergast.

R. A. Gilliam, of Montvale, delivered an address on "The Canning Industry from the Canner's Viewpoint."

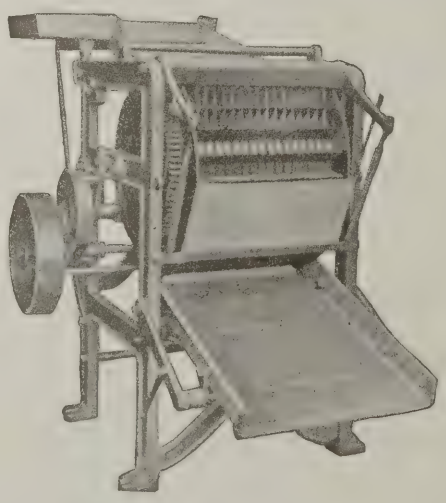
J. W. Gillespie, of Bedford, spoke on "Proper Care in Shipping, Neatness of Packing and Invoicing."

A resolution committee, composed of S. R. Price, N. A. Wood and S. W. Huddleston, presented resolutions tendering a vote of thanks from the organization to B. F. Moomaw, W. A. Reid and D. W. Wiley for their helpful talks, and to the Virginia Can Co. and Bedford Can Co. for the luncheon tendered the canners. Other resolutions were presented tendering thanks to President B. R. Ikenberry and Secretary-Treasurer W. G. Spigle for their efficient work during the past year. The resolutions were unanimously adopted.

Following the completion of the regular program the meeting was thrown open to a general round-table discussion, in which a large number of canners took part.

The outlook for the canning business this year was considered favorable. The tomato crop last year was threatened by several diseases, it was stated, and this will keep the growers busy if a bumper crop is to be secured.

The meeting opened with an address of welcome by B. F. Moomaw, secretary of the Chamber of Commerce. R. A. Gilliam, of Montvale, responded.



W. A. Reid, cashier of the First National Bank of Troutville, spoke on "The Canning Industry from the Bankers' Viewpoint."

County Agent D. V. Wiley, of Fincastle, gave an interesting talk on "The Canning Industry from the Tomato Growers' Viewpoint."

MARYLAND FARM WAGES HIGHER.

FARMERS of Maryland were required to pay higher wages to male farm labor during 1923 than in the two preceding years. The average rate per month with board in 1923 was $32.00, in 1922 it was $28.50, and in 1914 the rate was $17.00. The

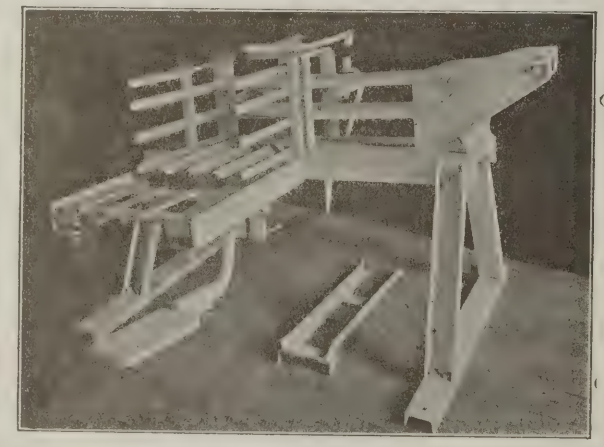
average monthly rate without board in 1923 was $48.00, in 1922 it was $42.00, and in 1914 the rate was $26.00.



Day wages for harvest labor with board averaged $2.70 in 1923, as compared with $2.17 in 1922, and with $1.38 in 1914. For farm labor other than at harvest time the rate per day with board was $1.95 in 1923, as compared with $1.54 in 1922, and with 94 cents in 1914.

The peak year in wages of farm labor in recent years was 1920. It was then that deflation of general prices began, and farm wage rates continued to decline until the fall of 1922, when an upward trend developed. At the close of 1923 farm wages were from 15 to 28 per cent below those of 1920, depending upon the character of the employment, and ranged from 190 to 200 per cent above the wages prevailing on the farms in the pre-war year 1914.

On December 1, 1923, farm labor offered a supply that was 71 per cent of the demand for such labor, or 29 per cent below the demand. Not so many farms were reported as absolutely idle. But a great many farms were mentioned as only partially worked—not worked at all intensively. Labor deserted the farms for the factories, the railroads, and for public works like road building, at wages the farmers say they are not able to pay. Unless the labor situation improves it seems likely that less acreage will be under the plow during the crop year 1924.

AMERICAN FRUITS CALLED FOR IN HOLLAND.

AMERICAN fruits are becoming nearly as well known throughout Holland as are locally produced fruits and fruits from Holland's colonies in the Far East. There has been a rather notable increase in the imports of American fruits at the present time, particularly apples and raisins, says the Foodstuffs Division of the Department of Commerce. A slight falling off, however, is noted in the imports of dried apples. American grape fruit is being used in Holland to an increasing extent, but the imports of this, as well as all other citrus fruits from the United States, are made by way of Great Britain, so that it is not possible to secure any definite statistics as to the American portion of the trade. The United States has furnished direct 595 metric tons of the 920 metric tons of canned fruit imported during the first eleven months of 1923. Most of the balance of the trade is in canned tropical fruits from the East Indies. The increase in the fresh apple trade has been especially notable since the import of such fruit from the United States heretofore has been a matter of serving the fine trade only, whereas now some of the finest quality American apples have geen coming into the country at prices which enable them to compete with the more ordinary apples from Italy, Germany and other nearby countries.

The New KYLER BOXER.

A machine, simple in construction, positive in action, which takes the cans from the Labeler – or Automatic Cooker – as fast as they come and places them in the cases without injuring the cans or Labels. Sturdily built to last a lifetime; all metal – operates either by foot or hand – both furnished with all machines – always on the job.

BALTIMORE, MD., December 6, 1923

It is with great pleasure we write you regarding the performance of the Boxing Machine we purchased from you this season. The features of this machine are too numerous to mention in this letter, but if you have, at any time, an interested prospect who desires to communicate with a present user, we will be only too glad to tell them of the many advantages we have found in using this machine. As a labor saver, it cannot be beat, and its construction could not be better, in our estimation. Very truly Yours J. H. Roberts & Co.

ESTABLISHED 1878

The Markets

BALTIMORE, MARCH 17, 1924

WEEKLY REVIEW

The Market Takes a "Breathing Spell"—Most Sections Well Sold Up on Both Spots and Futures—Higher Prices on Both Likely—Prices Which Should Be Ruling on Future Tomatoes.

ANXIOUS TIMES—During the week we have been asked, several times, what has caused the clump in business, now so apparent, for there is a slump just now. Frank Stare, the well-known market gauger of the Grocers' Supply Co., of Wausau, Wis., answers it in this way in his most recent circular:

"Interest kind o' pinched out all at once. It couldn't continue forever. It was certainly great while it lasted; never saw anything like it. We do not mean to imply that any unusual situation has developed. On the contrary, present conditions are entirely normal. They couldn't be otherwise. **Wisconsin canners have practically nothing to sell,** either spot or futures. Buyers, on the other hand, must be pretty well covered."

We have only to add that what is true of Wisconsin is equally true, to a greater or less extent, of every other section. Of course, there must be some dragging, some who have a few spots to sell and some who want more future business; but, speaking of the industry as a whole, the situation is in a most favorable condition, and there surely is no reason to worry over the present slump, or, as we term it elsewhere, this "air-pocket" in business. The feverish condition of both buying and selling could not continue indefinitely—there must be a bottom to every bin—and on both spots and futures not a few canners have reached the absolute stopping point, and in the same way a large number of buyers must have covered their wants. He must be a very pessimistic canner who will feel "blue" over this breathing spell, for that is about all it is.

The spot market has been quiet this week, as it was last week; but those who can "sense" the market feel that more active buying of spots must be right at hand, if it does not reach the market before this is read. Canned Foods Week has caused a vast increase in the consumption of available stocks, and the drain is still in full force. There is an end to both the retailers' and the wholesalers' ability to meet this demand, and the trick of the wholesalers to buy from each other instead of from the canners is only postponing the day of coming into the market and making certain that more will come in together than would have done so otherwise. The strength of the situation is in the heavy demand and consumption by the people, and this will be met, if there are enough goods of the spot kind to meet it, which is rapidly becoming the question. One section after another is rapidly becoming completely cleaned out of spots of all kinds, especially of peas, tomatoes and a number of the lesser goods, and of corn and fruits as well. The consumers' heavy onslaught upon canned foods is just beginning, and there will be a scramble for the most wanted goods before long.

The weakest item in the whole list has been fruits, which for some reason have not been in as active demand as other items of canned foods. Our market page seems to show a determination to clean out on some of these, and reductions are, accordingly, noted. Standard yellow cling California peaches are quoted this week at $1.90, Baltimore, as against $2 previously. Hawaiian pineapple also shows some reductions: No. 2½ extra sliced at $3.20, 2½ standard sliced at $3, and No. 2 extra sliced at $2.85. Eastern pie water pineapple, No. 10s, which have been out of quotation, are now offering at $5. No. 2 extra preserved strawberries are now quoted at $2.30, a reduction of 10c. And standard No. 10 strawberries, in water, are quoted at $6, a reduction of 50c. Cove oysters of the 5-oz. size are offered at $1.55, as against a previous price of $1.60.

Other items in the spot list remain unchanged and firm, except sweet potatoes, which have been selling well and which are largely out of quotation in this market, although the No. 3 size is offered at $1.45 in the county, an advance of 20c per dozen. Considering that tomatoes, corn, peas and the other items which are mainly held in this immediate section as spots are not mentioned in this list, the spot situation may be said to be very strong. Tomato houses in the counties say that stocks are small and that demand is increasing with the coming of spring, and they all look for better prices. Certain it is that what stocks are held are in hands which can hold them and which intend to hold them until they get the price they consider them worth. If buyers are waiting in the belief that lower prices will prevail, we fear they are going to be badly disappointed, and that in fact that they will have to pay much higher prices than now are possible as soon as the holders fully realize that this section has a practical control of the tomato situation. Indiana can find only a few clean-up lots of tomatoes, mainly a few odd cases, and nowhere a carload of any size or grade. And they are holding No. 2s at $1.10, with No. 3s at $1.60, and what few near-fancy No. 2s that can be found at $1.20. When the Tri-State canners, and other tomato canners of this immediate section, learn this there will doubtless come a very decided turn in tomato prices. That is very much of a certainty, whereas chances for lower prices seem to be very, very remote.

FUTURES—Future peas are about out of the question. The same authority we quoted above says:

"It is a safe bet that a larger volume of future Wisconsin peas, beans and beets have been sold than any year since the canning game in Wisconsin could be dignified as an industry. The sale of future corn has also been very satisfactory. If any canner has not sold all the futures he wants to, it is his own fault. Opportunity has all but broken down his door. Of course, there will be more futures sold; no doubt a lot of them. However, the big business on future Wisconsin canned foods is over."

Baltimore canners are to be classed rather as buyers of futures than sellers of them, and so they are not greatly interested in the question of futures, and consider the market in that phase as uninteresting. In the counties it is said futures have

been only fairly active this week. This applies to both corn and tomatoes. There are still lingering rumors of low prices on tomatoes as if the "hungry" have not yet been fed up. In the olden days even slaves used to be sold to the highest bidders, but in these modern days they are sold to the lowest bidders—but, even so, we should think they were pretty well sold up by this time.

Just this should be said about tomato futures: The industry has never been able to produce enough canned tomatoes **in one season** to oversupply the market, even when demand was very much less than it is known to be today. It took the accumulations of several years, and a "slew" of poor quality stuff, to break the tomato market below cost. The season of 1924 will start with absolutely clean decks and holdings in wholesale and retail hands at record low ebb. More and more men have learned the fallacy of packing "anything," and more and more are packing a fine quality only. Put the two together—better quality, plus empty supply sources—and add an immensely increased consumer demand, and see if you can find why tomato future prices should be as low as they are by a considerable margin. For only one reason, and we have pointed that out—in the slave story above. With that market-disrupting influence out of the way, future tomato prices in these Tri-States should easily reach the level of the Western canners and more, because those canners are quite well sold out. The jobbers are not covered on tomatoes, not by a jugful. If the tomato canners who stand on their own feet had but a little backbone and stood firm for proper prices, they would get them, or they would have the spots to sell next fall at very much better prices and at substantial profits. It is the tomato canners who kill the future tomato market, or, rather, the way they do business. Future 1s are worth 65c as a minimum, 2s at $1 to $1.10, 3s at $1.45 to $1.50 and they would be that today if the canners who constitute the great bulk of the total pack had the "guts" to sell their goods only at such prices. But, again, the tail is wagging the dog. The buyer will not pay you such prices unless you ask them.

Spot sweet potatoes are selling at $1.45 and futures are offered at $1.20. Why? Spot and future corn is showing more reason in this respect: Good standard crushed corn is quoted at 95c of spots and at 90c for futures.

NEW YORK MARKET

Business Holding Up Well—Future Maine Corn Is Selling Very Well—A Merger of New England Jobbers—Future Tomatoes Selling Fairly Well—Sweet Potatoes Are Higher—Interest Showing in Spinach—Systematic Buying—Trade Notes.

New York, March 13, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

BUSINESS Satisfactory—While all remains quiet along the canned foods Potomac—Hudson street in this instance—an underlying condition of firmness prevails, and business is holding up well. Distributors are still rather active buyers of futures in all lines on which prices have been named, and they are likewise in the market right along for small quantities of spot canned foods for immediate distribution.

Fancy Maine Corn—Business on futures has exceeded expectations, and one canner, probably the largest corn packer in Maine, has let it be known that he cannot accept any additional future business here. With the packing season still several months away, canners are naturally neglecting no precautions, but further offerings will no doubt be made as soon as the packers have a chance to figure on their probable packs.

New England Jobbing Merger—One by one the number of wholesale grocers in the East seems to be narrowing down. Reports from Boston during the week noted the purchase by Reid, Murdoch & Co., of Chicago, of the business of the William M. Flanders Co., one of the oldest grocery jobbing concerns in the Hub. Reid, Murdoch & Co. will transfer some of its sales force to Boston and operate the business there as a branch of the Chicago house. Reid, Murdoch & Co. are already operating in the New York territory, having opened a warehouse at the Bush Terminal about two years ago.

What's Wrong With the A. & P.?—The Great Atlantic and Pacific Tea Co. is running a contest in New York city, offering $5,000 in prizes for the best criticisms from its customers telling why the customers like the stores, or why they do not like the stores. Criticism is especially invited by the company. There would be some interesting reading if some of the wholesale grocers would enter and tell why they don't like the A. & P.

Future Southern Tomatoes—Maryland and Delaware tomato canners continue to receive a satisfactory volume of carlot business on futures. The present buying indicates that distributors regard tomatoes as a "good buy" at present prices of 57½c on 1s, 87½c on 2s, $1.27½ on 3s, and $4.00 on 10s, all f. o. b. country canneries on 100 per cent delivery contracts. Canners are now offering future tomato puree at 50c for 1s made from trimmings, and 57½c for 1s packed from whole tomatoes. The market on spot tomatoes for shipment from country cannery has stiffened and is held at 62½c for 1s, 95c for 2s, $1.37½-$1.40 for 3s, and $4.65 for 10s.

Sweet Potatoes Higher—Canned sweet potatoes, which evidently have been hibernating during the winter, recognized the coming of spring with a start last week, and the market stiffened considerably. No. 3s are now held at $1.45, with some interests predicting a higher market. Holdings of canners are very light; many did not can sweet potatoes at all during the 1923 season, owing to the weak market caused by the carryover of 1922 pack.

Spinach—Some interest is being shown in new pack Maryland spinach. The market is quoted on the following basis, for cannery shipment: 2s, $1.10; 2½s, $1.45-$1.50; 3s, $1.50-$1.55; 10s, $4.65-$4.75. Futures are quoted at $1.00 on 2s, $1.40 on 2½s, $1.45 on 3s, and $4.25 on 10s, f. o. b. cannery. Buying is rather quiet thus far at these prices, it is reported locally.

Systematic Buying—One of the largest local canned foods buyers here has put into effect a new schedule of buying. Brokers and canners are received during a two-hour period in the morning, and for two hours in the afternoon. During the afternoon, however, no new business will be taken up, the time being devoted to final disposition of "propositions" which have "been put up" during the morning. Most of the local buyers are now working on some such schedule.

Canned Foods Week Successful—Reports from jobbers, chain stores and retailers indicate that Canned Foods Week this year was successful in the metropolitan territory. Increased sales were reported from retail stores all over the city, and the cause of canned foods received considerable impetus.

Federal to Expand—The Federal Food Stores, Inc., operating a chain of grocery stores in Brooklyn, are offering to the public stock in the company. In its letter to "prospects" the company says: "A few years ago the chain store was simply an experiment. Today YOU know that they are sweeping the country, and in a few years the old-fashioned grocery store will pass out of existence. This popularity of the chain grocery store is due chiefly to one thing—PRICE. The ability to buy in large quantities makes it possible to buy more cheaply—consequently they can sell more cheaply, and at a greater profit. The average earnings of the chain stores are tremendous. The yearly dividends to stockholders are unusually large."

New Era of Retailers—The above regarding the "old-fashioned grocer" may be true, but during the past year or so a new class of independent retail grocers has made its appearance in New York, and is thriving and growing despite the chain stores. It is significant to note that many of the new independent stores are owned and operated by men who have served for a few years as chain store grocery managers, and practically all of them are featuring canned foods just as extensively as the chain stores.

Trade Notes and Personals—R. C. Rhodes, former manager of the canned foods department of Seggerman Bros., Inc., is now a member of the canned foods sales force of Hogan-Levine Co.

W. D. Breaker, of W. D. Breaker & Co., Inc., local brokers, leaves this week for a visit to his Pacific Coast principals. W. D. Breaker & Co., Inc., have a large canned foods department under the management of Ross Yerby, well-known among canners all over the country.

The annual report of the New York Canners, Inc., show that this organization during 1923 effected sales of $11,835,206, with a net income of $803,172, leaving a surplus of $485,343 after payment of dividends.

A. F. Sisk, of A. W. Sisk & Son, of Preston, Md., was in the market during the week.

Wainwright Churchill has been appointed New York manager for Thomas Roberts & Co., Inc,

L. Meulendyke, of W. N. Clark Co., canners, of Rochester, N. Y., was making the rounds of the trade here during the week.

CHICAGO MARKET

Canned Foods Week Sales Heavy—Difficulty in Filling Orders for Spots—No Concessions in Prices—Fancy Corn in Demand—Some Inquiries for Tomatoes—Mostly Only Poor Peas Now in Canners' Hands —Western Canners Will Meet at Hotel Sherman, Chicago.

Chicago, Ill., March 14, 1924.

By "Wrangler,"

Special Correspondent "The Canning Trade."

GENERAL Conditions—The canned foods market is in a reactionary state. There was a heavy demand for canned foods during the week previous to Canned Foods Week from the retail trade in preparation for that event, but during Canned Foods Week there was very little buying on the part of the retailers, especially city retailers, as they were so busy selling their previous purchases that they had no time to consider additional buying.

From what I can hear, the sales of canned foods during the special week have been very heavy, and the wholesale grocers are now beginning to receive business from the retailers for replacement purposes and to replenish their stocks which have been sold to a very low stage. Wholesale grocers find that their own stocks have been depleted to an important extent by the special Canned Foods Week demand, and they are now finding some difficulty in filling orders on account of broken assortments in canned foods.

But little attention is being paid to contracting for futures in canned foods, and most of the attention of buyers for wholesale grocery houses is being turned to the search for spot goods of various grades, and their efforts, aided by the efforts of their brokers, are not altogether satisfactory, as the supplies of spot goods are very small and assortments in various cans are badly broken.

There are no recessions in prices of canned foods to be noted except in canned apples, which are being offered at $3.00, f. o. b. Michigan, for No. 10 size, and in canned pumpkin, which is offered as low as 85c for No. 3 and $2.75 for No. 10, f. o. b. Indiana canneries, for small lots which canners desire to close out so that they can close their warehouses until the canning season begins again.

Canned Corn—There is a great demand for extra standard and fancy canned corn, and wholesalers are disposed to buy spot goods liberally, but future contracting is confined and has been confined to the large establishments which supply the wholesale grocers with canned corn for their private labels, and which always take orders in advance of the season for considerable quantities for that use and purpose.

Canned Tomatoes—The supply of canned tomatoes is limited almost entirely to the Eastern canneries, and there is some buying in No. 2 size especially. There are some inquiries for No. 10 size of extra standard and fancy quality, but these grades are hard to find, so the brokers state, and but few transactions are to be noted in them.

Canned Peas—The supply of canned peas in first hands in Wisconsin is not important, and the few lots which are to be found are usually undesirable quality or slow-selling grades. The canners of Wisconsin have pretty well sold out up to their prudent line of capacity for future or 1924 pack of canned peas, and are not pressing their brokers for additional business. In fact, brokers representing Wisconsin pea canners state that they are having some difficulty in finding canners who are willing to take on additional future business.

Canned Fruits—Michigan canners are pretty well closed out as to canned fruits with the exception of a few small lots of specialties in the way of whole peaches in No. 10 cans and whole spiced peaches in No. 10 and 2½ cans and some sliced peaches in smaller cans.

A few cases of berries are occasionally found in the hands of Michigan canners, but the lots are very small and unimportant.

There is no stock of canned apples of important quantity in the hands of Michigan canners, as they packed but few this season, and have found no profit in marketing what they did pack. The warehouses in Chicago and in other large cities where the wholesale packers are located are filled with apples in barrels and boxes, and the bakers are buying them cheaply and using them in preference to apples in No. 10 cans. Consequently there is a very little demand for canned apples.

A broker told me that the sale of Maine canned corn had greatly decreased in Chicago in the past five years, as it was being replaced by Minnesota fancy Crosby corn and fancy packs of Country Gentleman corn. The broker claimed that not more than 50 per cent of the Maine corn came to Chicago now as compared with that which came here five years ago.

The Directors of the Western Canners' Association have voted to hold the April annual convention of that Association at the Hotel Sherman, Chicago. The days will be Monday to Saturday, inclusive, April 21, 22, 23, 24, 25 and 26. A special railroad rate of one and a half fare for the round trip has been applied for and will be granted. A large attendance is desired and expected.

The National Canners' Association will hold meetings of some of its Sections in Chicago at the same time, namely, Corn Section, Pea Section, Tomato Section and possibly the Fruit Section. This will add interest to the convention and bring a large attendance of canners to the city.

The month of April in Chicago is usually mild and agreeable as to weather conditions, not too hot, not too cold.

The April meeting of the Western Canners' Association is the regular annual meeting, and there will be an election of officers. There will also be a fine program which will be participated in by the best talent in the industry. There will, however, be no display of machinery or canned foods exhibits.

ST. LOUIS MARKET

Business Fair—Most Futures Have Been Bought—Spot Peas Hard to Find—Trading Between Jobbers—No Surplus Corn in This Market—Tomatoes Rule Steady— Buying Fruits Only as Needed—Canned Foods Week Was Well Observed.

St. Louis, March 13, 1924.

By "Missourian,"

Special Correspondent "The Canning Trade."

THERE is a continued fair movement of canned vegetables for both spot and future shipment. It is said, however, that most of the future business, as far as this market is concerned, has already been placed. Peas of the 1924 pack were sold readily, but the larger distributors continue to give them considerable attention. Corn has had a wider demand and is now pretty well sold up. Tomatoes have been irregular, good at times and slow at others. There is an even demand for other lines of vegetables.

Peas—Spot peas are a hard item to locate at prices which will be paid by the buyer. Full prices are easily obtained, as sellers do not care whether they unload now or later on, as they believe there will be an outlet for all 1923 lines before the present season is over. Cheap lines have the call and are the strongest. All grades are well placed. Nearly all of the stocks for trading are furnished by second hands, as primary points are nearly out. There is only a moderate future business being placed, as there was much free buying done earlier in the season, the highest market in the country now and the lack of offerings from any packers. Futures have outsold other commodities, and so much business resulted after the original opening that standard No. 4s and 5s are now quoted 5 or 10 cents over the first of the season. Since canners are pretty well booked up, they are somewhat indifferent. The same holds good of the buyers since they have booked at least part of what they want. Favored brands are most in demand, but they are hard to get. Future prices now quoted here, f. o. b. at points of production, are:

Fancy No. 1s, Alaska-Wisconsin	$2.60
Fancy No. 2s, Alaska-Wisconsin	2.20
Fancy No. 3s, Alaska-Wisconsin	1.65
Extra Standard No. 2s, Alaska-Wisconsin	1.90
Extra Standard No. 3s, Alaska-Wisconsin	1.40
Fancy No. 2s, Sweet	2.25
Fancy No. 3s, Sweet	1.90
Fancy No. 4s	1.60

Corn—Corn is in pretty good shape, both on spot and futures. There is no large surplus on spot, so that when a dealer comes to cover he must pay full market prices. Fancy corn is scarce and is very firm in price. Like peas, most of the future trading seems to have been placed for the present, but buyers are still anxious to cover when they can get inside prices. The excitement in new packs subsided after Maine and Middle West canners reported satisfactory bookings of fancy and standards.

Jobbers have not enthused much over the Maine opening. Well-known packers, however, got their usual business. The Middle-West packers, however, were strong competitors because of the good quality of their pack and because they quoted better prices. Prices of better known brands have been at opening. Futures are quoted here as follows, f. o. b. at points of production:

No. 2 Fancy Crosby, Minnesota	$1.35
No. 2 Golden Bantam, Fancy, Minnesota	2.00
No. 2 Standard, Evergreen, Wisconsin	1.00
No. 2 Extra Standard, Evergreen, Wisconsin	1.10
No. 2 Fancy Country Gentleman, Wisconsin	1.30
No. 2 Fancy Country Gentleman, Illinois	1.35
No. 2 Extra Standard, Illinois	1.00
No. 2 Standard, Iowa	.95
No. 2 Standard, Indiana	.90
No. 2 Extra Standard Country Gentleman, Indiana	1.30
No. 2 Standard, Ohio	.95

Tomatoes—There is a fair demand for spot tomatoes and prices rule steady. They are taken only for immediate requirements. The demand is mostly for small sizes No. 2 and No. 3, small sizes for immediate use, and not for speculative purposes. For quite a while the trade has been on a hand-to-mouth basis, and it continues this policy.

No. 2 Standard, Illinois	$1.10
No. 3 Standard, Indiana	1.60
No. 10 Standard, Indiana	5.50

Fruit—The demand for fruit is rather quiet and almost neglected, and the disposition is to buy only for immediate wants. Spot offerings for immediate delivery and in small parcels are preferred as a rule to factory lines. Seconds, in peaches, are developing more firmness. All grades and sizes of California fruits are available, with no special interest on any one item, except for urgent requirements. Apples are quiet, but canners having the goods are not trying to unload. It is hard to quote spot prices. No. 3 apples are quoted $1.10, f. o. b. Missouri.

Fish—Canned fish has been in greater demand owing to the Lenten holidays. There has been an increase in the movement of canned salmon, and stocks that have been on hand were distributed freely. Pinks, medium reds, reds and chinocks all moved well. Sardines were not quite as active. Prices, f. o. b., are:

No. 1 Tall Chinock	$3.70
No. 1 Tall Red Alaska	3.25
No. 1 Tall Pink Alaska	1.25

Notes—The outstanding feature in the trade this week was that the Niehoff Grocery Co., a wholesale grocery firm, Eighth and Spruce streets, St. Louis, has been acquired by the General Grocery Co., which already comprised three separate wholesale grocery firms, consisting of the Amos-James Grocery Co., the Scudder-Gale Grocery Co. and the Haas-Lieber Grocer Co. The purchase price was placed at $175,000. L. H. Niehoff, of the Niehoff Company, is to transfer his interests in that firm to the Amos-James Co., of the General Grocery Co. The Amos-James Grocery Co., now located at Third and Washington avenue, will remove its entire business, it is understood, to the buildings and warerooms now occupied by the Niehoff Company at Eighth and Spruce streets. With the addition of the Niehoff Company's business it is said that the combined volume of sales for the General Grocery Co. will total approximately $20,000,000 a year.

Canned Foods Week was well observed here last week, and many stores had displays showing a varied assortment of vegetables and fruits. Canned milk was especially well represented, the Pet Brand, in many windows in the business district.

CALIFORNIA MARKET

Crops Benefited by Rains—Asparagus Coming to Market—Canning Soon to Begin—Pack Mainly Sold in Advance—Exports Dropping Off Again—Canned Foods Week Splendidly Supported—Great Acreages of Fruits to Come In—Coast Notes.

San Francisco, March 13, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

THE Crops—March was ushered in by a light rainstorm that covered the entire State, and growing crops were greatly benefited. The precipitation was heaviest in the territory south of San Francisco, where rain was needed the most, and proved most acceptable to growers in Southern California where crops were suffering. It has relieved the situation immeasurably, but the rainfall to date is far below normal, and there is scarcely any snow in the mountains to furnish water for irrigation. The snow at Summit is but about twenty inches in depth, whereas in some years it has been as many feet. The recent rains have served to prevent immediate losses, and crops in California will depend upon weather conditions the next few weeks.

Asparagus—Asparagus is commencing to move to the markets in carload lots, and canning operations will be under way shortly after the middle of the month, if the weather continues warm. Canners have experienced a very heavy demand for their output, and there will be very little unsold by the time packing operations are commenced. One large operator has disposed of all he expects to pack, and it is estimated that the trade, as a whole, has sold fully 90 per cent of the pack that can be put up. The output promises to be larger than that of last year, owing to an increase in acreage. Most packers have named tentative, rather than definite, opening prices; but all have protected their customers against a decline.

Exports—The spurt in export business in California canned fruits has come largely to an end, probably owing to the fact that the grades most in demand have been about cleaned up. Some canners still have stock of the better grades, but the domestic demand is fast absorbing these. Pears are about out of the market, and peaches and apricots are none too plentiful. There is scarcely anything to be had here in No. 10 water and pie fruits and seconds in all sizes are in light supply.

Olives—The packing of ripe olives is still under way in California, although some plants are closing for the season and are being placed in shape for the handling of early vegetables. The olive crop in Northern and Central California proved of good volume, and officials of the California Olive Association estimate that the output for the season will be fully 700,000 cases. In addition to this, large quantities have been salted and handled in the green state. The pack of last year was in the neighborhood of 425,000 cases.

Spinach—Revised prices on canned spinach of the 1924 pack have been made by Walter M. Field & Co., which handles the output of the Bay Side Canning Co. The new prices are: No. 1s, $1.05; No. 2s, $1.20; No. 2½s, $1.45, and No. 10s, $4.75. These prices are the same as those of the California Packing Corporation and Libby, McNeill & Libby on No. 1s and No. 2s, but are 5 cents lower on No. 2½s and 10 cents lower on No. 10s.

Canned Foods Week—San Francisco did itself proud this year in the observance of Canned Foods Week, and made displays so that even those who run could not fail to notice them. Great department stores, such as the White House, which do not carry groceries, gave freely of their window space in the interests of the canning industry, which is such an important factor in the prosperity of the State. Restaurants gave over their windows to displays of canned products, and canners obtained the use of windows in vacant stores, where such could be located. The thousands of commuters to the east-bay suburbs of San Francisco admired the striking display of the Virden Packing Co., which secured the display windows of a large building just completed on Market street and installed an exhibit that was a work of art. Newspapers gave the event much publicity, and a marked increase in business was noted by retail grocers.

The Recent Convention—The annual convention of the Canners' League of California, which came to a close the first day of March, was a highly successful affair and was very well attended. The program as originally outlined was carried out in full, with a few changes in time, and the discussions proved of marked interest. One of the interesting features of the convention was the decision to co-operate with the growers of canning peaches in formulating a national advertising campaign to stimulate the demand for this fruit, and President Elmer E. Chase was authorized to appoint a committee to attend to this. The pack of 1923 has virtually been moved, but Vice-President and Secretary Preston McKinney pointed out the fact that by 1928 the output of canned cling peaches would be about 14,000,000 cases, instead of 7,000,000 cases, which represented the pack last year, the increase being figured on the acreage that would be in bearing by that time. Optimistic reports concerning marketing conditions were made by W. A. Gellerson, of Libby, McNeill & Libby; G. H. Bradt, G. H. Herbert and Frank E. Booth. Directors for the coming year were chosen as follows: Elmer E. Chase, of the Richmond-Chase Co., San Jose; R. M. Marthold, of the California Packing Corporation, San Francisco; Walter M. Field, of Walter M. Field & Co., San Francisco; W. A. Gellerson, of Libby, McNeill & Libby, San Francisco; Frank A. Wilder, of the Pratt-Low Preserving Co., Santa Clara, and D. L. Smith, of the Smith-Frank Packing Co., Sacramento and San Jose. The directors will meet at San Francisco and name their officers.

Coast Notes—A meeting of the Board of Directors of the California Olive Growers' Association was held at Fresno on March 4, and officers were chosen as follows: President, B. A. Harbour, of Hemet; vice-presidents, Ben Hayes of Madera, G. E. Faultings of Orland, and F. L. Pierce of Highland; secretary-treasurer and general manager, C. E. Weikert, of Fair Oaks. Mr. Harbour had been acting as president since the resignation of H. T. Miller, of Bakersfield.

The California Packing Corporation, which owns a large ranch near Ignacio, Cal., plans the erection of a canning plant there, according to published reports.

Canned "jelly juice," a product upon which the fruit products laboratory of the University of California has been working for several years, is now making its appearance in a commercial way. The Exchange Orange Products Co., at San Dimas, has commenced the manufacture of citrus jelly and marmalade juices to supply the wholesale manufacturers of jelly and marmalade. A San Jose firm is putting out a product known as "Ju Ji," and other firms are preparing to put out similar products. The canned jellies form a reliable and convenient starting point for jellies of any flavor. When sugar is added and the mixture boiled two minutes, the housewife is assured of a delicious fresh jelly.

MAINE MARKET

A Blizzard Sets in to Paralyze Business—Clam Canning Has Been Delayed—Clam Prices on Upward Trend—Future Corn Continues Active—Beans Are in Demand—Clarence A. Weston Celebrates 75th Birthday.

Portland, Me., March 14, 1924.

By "Maine,"
Special Correspondent "The Canning Trade."

WITH spring but a few days away, Maine has experienced this week one of the worst winterlike blizzards for many years. Transportation and communication have suffered for the first time this season. This all has a very demoralizing effect on business, which was about ready to open up for spring, and will result in a setback of several weeks.

The immediate effect upon local canning business is the delay in starting work in the clam canneries and interruption in receipt of fares by the fish canners. The clam factories had expected to open up this week in a limited way, but the time will now be set ahead at least a fortnight. Buyers who are out of stock have anticipated early receipts of new goods. Spring contracts carry a price of $1.30 for the regular 5-oz. size. The 8-oz. package is put up only on order and brings around $2.00. It is increasingly difficult each year to get clams for the cannery, and prices are doubtless on the upward trend.

Future corn continues active and is really well sold up. As usual, the established canners who have built up and maintained a good business policy are now the ones sold up, and at full prices. The man who makes low prices invites question as to his product or methods and does not find a ready welcome in the market. Fancy Crosby futures are strong at $1.45, Golden Bantam at $1.70. If prices are quoted f. o. b. Portland, the figures are $1.47½ and $1.75.

Stringless Beans are in demand, more so than ever before. While the acreage this season has been considerably increased to take care of the larger sales, canners are not anxious to do a very heavy business at present prices, owing to the small margin of profit under even most favorable conditions. A poor crop or any factory or labor troubles would show an actual loss on beans this season. Prices are $1.30 for 2s and $6.00 for 10s and contracts are now out for practically the entire estimated up-put.

Clarence A. Weston, of C. A. Weston Co., celebrated his 75th birthday on March 3rd. This also marks his 56th year in the grocery business in Portland, where he is still active. Mr. Weston is also prominent in club and social circles, is a star bowler and a rare story-teller.

SMILE AWHILE

DENOUEMENT

"A book of verse," old Omar sang,
"A loaf of bread and thou,
A jug of wine and all the world
Were paradise enow."

The wise old bard no further sang;
He tried it for a spell;
The book, the wine, the loaf were fine—
The woman? She was hell!

—Edgar Daniel Kramer in "American Legion."

THE DEADLINE

The inquiring friend, in process of being shown about the newly-acquired country estate, stopped in amazement and demanded:

"What on earth are you doing with that zebra?"

"Ah!" said the host, amiably. "There's been so much talk about the danger of over-indulgence in this new stuff that I thought I'd better provide myself with a stop signal, and that zebra is just the thing. When I see it all one color, then I know I've had enough."

CONSIDERATION!

To wed or not to wed, that is the question. Whether 'tis better to remain single, and disappoint a number of women for a time, or marry and disappoint one woman for life.—Juggler.

MISS UNDERSTOOD

Mistress—I saw the milkman kiss you this morning, Janet. I'll take the milk in myself after this.

Janet—It won't do you any good, mum. He promised to kiss nobody except me.

THE JOKE'S ON HIM!

Patient—Can this operation be performed safely, doctor?

Doctor—That, my dear sir, is what we are about to discover. —London Opinion.

HOLDING HER OWN

Betty—And did he get down on his knees when he proposed?

Netty—No; I refused to move.—Town Topics.

DIDJA?

Nature is wonderful, isn't it?

Right. Didja ever see a pair of lips that wouldn't fit.—Puppet.

THREE CHANCES

Cop—Where are you going?

Woozly One—Don't tell me, mister. Let me guess."—Sun Dial.

THE GREATEST JOKE OF ALL

("Pop-Corn" in the March Bulletin of the National Wholesale Grocers' Association)

"For instance, this manufacturer's name-on-the-label bill must be kicked over into Mexico or Russia. My friend Royal, the canners' leader, is against this bill, and maybe he can set the Baltimore and Chicago editors right. Mebbe! Those militant mates, however, might have typhoid and recover, or pneumonia and recover, or yellow fever and recover. But if they ever had writer's cramp, they'd explode. Seriously, however, the wholesale grocers that trot with 'Pop' Corn depend upon this pair for many of their laughs."

(The W. K. Whl Gros. even laugh seriously!!)

EDITORIALS

LOCATING THE NEXT CONVENTION — The Location Committee, which consists of the Presidents of the three National Associations—canners brokers and machinery—met this week in Washington to consider the city in which to hold the next annual Convention. After just "getting over" the last big Convention, it is kind o' hard to think about another Convention; but maybe it is just as well to do this now, while the matter is fresh in our minds. And to allay your fears, we might hasten to say that there is not much danger of any definite decision for many months yet. To do so would seem like unseemly haste. We have heard nothing as to the cities discussed or considered, and the committee will, probably, have nothing to report for quite a while; but if they had their ears to the ground at the last Buffalo Convention, they will be careful about one thing—and that is to take the next Convention to some warm clime. The industry knows pretty well that we have grown sick of this annual barnstorming; that we have thumped as hard as we dare this old foggy practice of running from place to place to hold our annual Conventions—"even the foxes have burrows"—but this vaunted great and imposing canning industry has to go about the country begging some city or municipality to please take them in for their annual gathering. It is our belief that these Conventions should be held at one point every year, like other self-respecting bodies, and that that point should be one where the climate is agreeable the hotels plentiful and the machinery hall as fine as can be produced. But we are not anxious to force our opinion on others. However, as we have before stated, to us there seemed to be a demand at Buffalo for Atlantic City as the next point of meeting place, which seemed to be overwhelming. We kept no record of the number who urged us to advocate Atlantic City, and not only as the next meeting place, but as the permanent meeting place for the years to come, but certainly their number was large.

We hold no brief for Atlantic City; we have no axe to grind in advocating it; there is no personal advantage to us in its selection. Our only object is to please the greatest number. Of course, it is impossible to please everybody, but it is our honest belief that Atlantic City is the choice of more in this industry—on all sides—than any other single point that might be selected. The Committee is not seeking its own convenience; it, too, is trying to please the greatest number; but how can it know? We had thought of taking a referendum on the matter; to send out voting blanks and ask everyone to register his choice of cities, or for and against Atlantic City. Drop us a postal card, if you wish, and we will forward the cards to the Committee, and we are sure they will welcome the information given in that way.

THE PLIGHT OF THE EASTERN TOMATO CANNERS—It is not often given to any industry to have the solution of its problems as much in its own hands as is the case right now with the tomato canners of the Tri-States and nearby territory. And on both spots and futures. On spots the entire country is depending upon this immediate section for what tomatoes are wanted, for all other sections are cleaned out of them. Are the canners here taking advantage of their opportunity, Not in the least. Instead of standing firmly for the prices which they ought to know their holdings are worth, they can easily be inveigled out of the goods by being told that some fellow-canner is letting go at a lower price. Never before in their history have they seen the tomato market worked down to as clean a condition as it is today; but apparently that means little or nothing to them. We are not anxious to see record-high prices on spot tomatoes, for we do not believe that is good for the market; but at least there ought not to be any weakness, and certainly no timidity about asking the proper price. They read about the Indiana canners getting from 10c to 20c per dozen more for their goods than the prices here prevailing, and instead of jogging up their prices, they look for excuses, saying that Indiana tomatoes are being sold in territories where the freight rate is to their advantage, etc., etc. Everybody and everything else is to blame but themselves, for there is only one real reason why the Tri-States are not getting as high prices for their spot tomatoes as Indiana, or anywhere

else, and that is that the canners here have not the backbone to ask the price.

But the situation in future tomatoes is even worse. Most of the rest of the tomato-canning sections of the country have sold as heavily of future tomatoes—at very much better prices than the Tri-States have had—as they care to sell up to this time, leaving the market largely to this immediate section, the tomato canners of the Tri-States and Virginia. Are the tomato canners of this section taking advantage of this situation? Yes, by cutting each other's prices down to below what now seems to be bed-rock cost. Once more those other sections have written their contracts at prices which at least promise a fair profit—and they have practically withdrawn from competition, leaving the market on futures to this section. Instead of prices here improving on future tomatoes, they are growing weaker. And the jobbers are not insisting upon below-cost prices. The jobber is buying, of course, to the very best possible advantage—he is not a fool. But why these tomato canners, with the game right in their own hands, are acting as they are is too much for anyone to attempt to explain.

THE JOBBERS ARE COUNTING SWELLS—Elsewhere in this issue you will notice that the National Wholesale Grocers' Association is furnishing its members with blank forms for the careful accounting of all canned foods bought, swells allowed for cash claimed, with instructions to turn the sheets in on January 1st and every six months thereafter. They are going to find out just how this matter works and be ready to talk definitely to the canners after the present year's experiment with the swell claim matter has passed. You know this Warehousing Plan is only on trial for a year. There is not much question but what it will prove helpful to the canners in their efforts to improve their goods, and be worth a whole lot more than it will cost; and we presume the Laboratory will have careful record of whatever comes through its hands, and pass on to its members all the benefits derived from the examinations. And we expect these to be large and important, because this is the only real way to get at and correct troubles as they actually occur. In other words, these will be the real and not the theoretical faults of canned foods. So the industry stands to profit immeasurably from this Warehousing Plan, aside from the financial savings as compared with the flat-allowance scheme. But in what way will the buyers profit, and what will be the ultimate effect upon the buyers from the year's experiment? That is what the jobbers are going to find out for themselves, and they can be counted upon to come into next year's Convention with the facts and figures down in black and white, and then be ready to talk by the book.

Can the canners help their case any? Very decidedly. They must be careful to pack all their goods with the utmost caution; must be sure that their process times and temperatures are absolutely correct and safe; that they are not permitting unknown spoilages to get through to the consumers; in a word, that they are bringing to bear that almost perfected process about which we heard so much during the past discussion. This is what every canner should always do, and what the vast majority of canners invariably do, but it is more important this season than ever before, because the truth of your assertions is being tested, and the safety of canned foods is on trial. If there are any who still feel that if they are forced to grant any allowance on their goods, to cover the can or two in the retailers' hands, that they will see that that percentage of bad cans will be delivered, let them get this unfair thought out of their minds. Let every canner, large or small, be more than ordinarily alert to see that no bad can possibly gets into a shipment. Be unusually careful on this point, and, as we have said, during the season watch your process carefully and prove that canned foods are safe.

* * *

Early reports are that Hawaii eclipsed all previous celebrations of Canned Foods Week, which is saying a good deal, as it has been a leader in the movement. A Characteristic feature of the celebration was that they pushed all canned products except their own.

"THOM" SCOTT VACATIONING

ASK the casual visitor to any local or National Convention of canners, and he will probably tell you that Mr. Thomas A. Scott, directing genius and head of the Chisholm-Scott Co., always takes it easy, as a gentleman of means and leisure should—at all meetings except, of course, the Wisconsin meeting, when he is always the busy bee—and that he is now on a pleasant vacation jaunt to the Southern climes, including Cuba, may cause a smile. But, fact is, while "Thom" has the easy air of contentment and repose, he is a very hard worker, continually on the job. It is no sinecure to manage a business the size and extent of the Chisholm-Scott Co.

"Thom" says this is his first vacation, and he was good enough to drop the writer a line from down in Cuba to wish that he were with him to enjoy all the pleasures of that blessed land. Just why he thought we would enjoy Cuba more than New Orleans, Palm Beach or other such attractive places he has visited can only be surmised, but you know "Thom" is a prince of entertainers! Our only regret is that we could not join him. But we have one thing on "Thom"—our first vacation in still in front of us!

DEATH OF HENRY R. STICKNEY

THE death of Henry Rolfe Stickney occurred at his home in Portland, Me., on March 12. A natural mechanic, Mr. Stickney first became identified with the canning business when he was called upon to assist in working out the constantly developing problems of the young industry, and his interest has remained there even though his activities later became more diversified. Several important inventions and improvements which he worked out are still in use throughout the country. The Conant Cooker for corn was one of his first developments, later giving place to his Burnham Cooker. The Stickney Mixer and Stickney Hoist were standard equipment in all canning factories for many years. His latest production was a filler for evaporated and condensed milk, for which the demand grew beyond his ability to manufacture.

More than this, Mr. Stickney was the personal friend, from boyhood, of many of the men who grew up in the Maine canning business, and his death is an intimate grief to them, as well as to the many friends he had throughout the canning industry of the United States.

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER:

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 Quality.

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water-front enable us to give the Service required.

Our connection with closing machine manufacturers enables us to furnish the latest, speediest and best closing machine Equipment.

Can you see any reason for not letting us take care of your requirements in the manner you desire?

Tomato Production in California

By J. T. Rosa

University of California College of Agriculture
Agricultural Experiment Station

Circular No. 263

THE production of tomatoes is one of the important agricultural industries of California. In 1922, 2,226 carloads of tomatoes were shipped for table purposes; the canneries packed 1,925,389 cases of the whole tomato, and 1,489,617 cases of other products, such as pulp, puree, catsup, and paste. Large quantities are grown for local markets; a considerable acreage is grown especially for seed production; and in home gardens throughout the state the tomato is a crop of first importance. Thus it is seen that the tomato is grown for a number of distinct purposes in the state, each amounting to a business of considerable proportions. While each of these lines of production and utilization have grown steadily in recent years, there is at the present time come concern over the relatively low yield per acre. The average yield for California has varied from 5.5 to 7.2 tons an acre in recent years. While these yields are much above the average for the whole United States, they are far below the possibilities of economic production with the favorable soil and climatic conditions existing in many sections of the state. Yields of ten to twenty-five tons per acre are frequently obtained and such yields are attainable easily by skillful growers. Surveys in other states have shown that the grower producing yields below the average is likely to be losing money on the crop, while other growers in the same district whose yields are above the average, make a good profit. The object of this circular is to describe successful methods of growing and handling the crop, and to point out in a general way some of the basic principles underlying better production. However, when the culture of such a crop as tomatoes is considered, due allowance must always be made for the diversity in soil and climatic conditions existing within the state, and the variety of purposes for which the crop is grown.

PRODUCING REGIONS

At present commercial production is more or less centered in a number of important districts. The earliest tomatoes are grown in the Imperial alley and are shipped in considerable quantities to Western markets. Possibly the use of a better shipping variety, or the adoption of better cultural practices, may result in the production of fruit that can be marketed successfully further east in competition with the Florida crop.

Los Angeles, Ventura, Riverside, Orange and San Diego counties produce a large quantity of tomatoes for all of the uses to which the crop is put, but most important part of the tomato business in this district is the production of a late or fall crop for eastern shipment. From September to December, after disease has killed the plants in the Southern States and frost has ended the crop in the Northern States, there is a good demand for California tomatoes in the East.

The San Joaquin Valley has considerable tomato production, most important being the production of early tomatoes for shipment, centered at Merced. After the shipping season ends, the later part of the crop is utilized for manufacturing purposes. Tomato production in this section is on an extermely intensive basis and the returns by the acre are high.

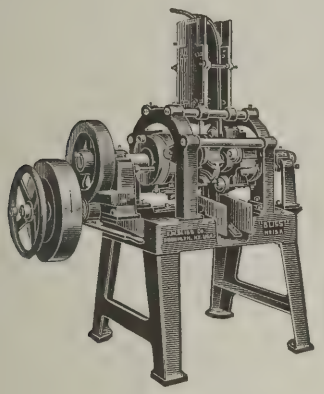
The Santa Clara Valley is one of the oldest and most important districts for the production of tomatoes for canning and manufacturing.

The San Francisco Bay district is an important producer of canning and manufacturing stock, as well as fruit for local markets and for shipment to the East during the fall months. Some growers contract their entire crop to a cannery, while others ship their crop when market conditions provide a profitable outlet, but when the market demand is not good, turn their crop or a portion of it to the canneries.

The Sacramento Valley has several districts which are producing canning tomatoes extensively. One of the most important districts is around Sacramento.

Sonoma County is one of the most important districts for cannery production.

There are many other localities where the crop is grown for canning and other purposes on a smaller scale. Production for local markets is more or less important in all parts of the state. Fifty-two counties in California report a commercial tomato acreage. The most important counties in point of production are listed in the following tables with the number of acres for 1919.



CROPPING SYSTEMS

At present a large portion of the tomato crop in northern and central California is produced in connection with a winter crop of spinach. The tomato vines are pulled and burned at the end of the season in November, the land is fitted and sown to spinach at once. The spinach crop is harvested in March and April, and the land fitted in time to plant tomatoes again. This combination is a good one, but will lead to bad results if the same land is continuously cropped in this way, in fact, it seems that this practice is partly responsible in some cases for recent low yields of tomatoes. Tomatoes should not be grown more than once in four years on the same piece of land; they should be grown in rotation with other crops. Various diseases often become very common and do much damage when tomatoes are grown continuously.

Tomatoes are extensively grown as an intercrop in young orchards, to which purpose they are well adapted when the irrigation pratice for tomatoes does not conflict with the requirements of the trees. This may sometimes be an objection, especially in young walnut groves.

Perfect Flanges without Cracks

BLISS

Patented

"BLISS" Automatic Flanger

AN ESSENTIAL to a perfect sanitary can is a correctly flanged body. Our #15–K Automatic machine flanges simultaneously both ends of round sanitary can bodies, producing uniformly perfect flanges without cracks. With its installation you are assured of one of the essentials of perfect sanitary cans. That these machines are operating successfully in every independent can shop in the country is proof of their merit.

PLANT PRODUCTION

For the sake of economy of seed, earliness and convenience in growing the crop, the plants are usually grown in beds of one kind or another, from which the plants are transplanted to the field at the proper time. The best method of growing the plants varies according to the locality and the season at which the crop is desired.

The Hotbed-Coldframe Method.—The hotbed-coldframe method is usually best for early market crops, and perhaps should be used for the late shipping and canning crop in central and northern California. This method is described in detail herein, because its more extensive use seems desirable. The hotbed frame should be located in a warm, sunny, well drained spot. About one foot of fresh hot horse manure is placed in the bed, tramped down, and a layer of soil four inches deep placed over this. It is best to use a sandy soil or a mixture of one-half sand and one-half garden soil in the hotbed. This gives stronger plants with good root systems. The seeds are planted about ten weeks before time of field setting, sowing them broadcast, or drilled into rows about four inches apart and covered about one-half inch deep. If good seed are sowed at the rate of twelve or fifteen seeds per inch of row, one hotbed six by twenty-four feet in size should produce about 50,000 seedlings. The hotbed should be kept warm and moist until the plants are up, after which time it should be well ventilated and watered sparingly. As soon as the seedings show their first rough leaves, they are ready to transplant to the coldframe. This is a tedious task, but one that is worth doing well and carefully. The coldframes are prepared much like the hotbeds except that no manure is placed under them. A suitable covering for the frames may be made of eight or ten-ounce muslin. About four inches of fine soil should be placed in the coldframe, preferably a mixture of one part garden soil, one part sand, and one part rotted manure, all well mixed and screened through a screen of one-half-inch mesh if possible. The seedling plants from the hotbed are set therein about two by two inches apart usually, though wider spacing will give better results. Watering should follow transplanting and the frames should be kept covered a few days, until the plants have taken root. This is especially necessary if the sun is warm or the weather windy. After the plants have begun to grow, the frames should be ventilated freely during the day time, and watered only enough to keep the plants growing fairly fast. When the plants are ten inches high, the beds should be gone over and the terminal bud pinched out of each plant. This prevents the plants from growing any taller, and encourages the development of thick stout stems and good root systems. At the same time, shoots begin to develop in the axils of the leaves. In this manner, the framework for a large bushy plant is started before the plants are set in the field. This treatment of "topping" the plants two or three weeks before transplanting to the field has been found, in experiments by the writer, to result in considerable increases in yield of fruit. It has also been successfully practiced for years by certain growers in the Sacramento district, and perhaps elsewhere.

For a week or ten days before transplanting the plants to the field, the beds should be left open day and night, and only enough water appiled to keep the plants from very serious wilting. This treatment toughens or "hardens" the plants so that they will stand trans planting without damage or severe shock, which s often kills tender plants when set in the open field.

The Coldframe Method.—This method frequentl used where plants have to be started during coo weather but not so early as to require the hotbe method. Frames are prepared running east and wes in a sheltered sunny spot. A four-inch layer of sandy fertile soil should be placed in the frame. The see are sowed by hand or with a seed drill, being plante thinly in rows four to six inches apart. After germin ation, the beds should be weeded and the plants thinne to about three plants per inch. This method can b used to produce large numbers of plants cheaply, bu good large stocky plants with well-developed roots ar seldom grown in this way, the seed being usually plant ed too thick and the growers failing to do the necessary thinning.

The Open Bed Method.—This is probably the cheapest way to grow plants, but it is not adapted fo sections having short growing seasons or for crop production. It is adapted for growing plants for the late shipping crop in southern California and for the canning crop in northern California, though in the latter case it is believed that the hotbed method is really better. For the open bed method, beds are prepared in a well drained sheltered spot, preferably where the soil is sandy. The seed are drilled in with a seeder as soon as the soil warms up and danger of frost is over (about March 15 in the Sacramento district). Narrow beds thirty to thirty-six inches from center to center are thrown up with a lister, the ridges are harrowed down and levelled with a planker, and a double row is sowed on each bed. The furrow between the beds is used for irrigation when necessary. It is very important to see that the seed are not planted too thickly even in these open beds, and thinning the plants in the thicker portions of the bed should be practiced.

Care of Plants Beds.—Plant beds must be weeded and cultivated to prevent crust formation around the plants. Thinning the plants is often necessary, for if crowded they develop weak spindling stems, resulting in plants of very poor quality. Particular care should be given to the watering of plant beds, for over-watering results in weak, sappy, leggy plants are hard to transplant to the field and which recover slowly if they survive transplanting. Excessive moisture, especially if given late in the day, encourages "damping off," a disease which sometimes wipes out many plants overnight. Waterings should be given usually several days apart, and not until the plants show need for it. No harm is done if the plants are checked by lack of water. Tomatoes, unlike most vegetable plants, suffer little permanent injury even if severly checked in the seedling stage. However, holding plants for a long period after they have reached transplanting size will lead to bad results.

The day before transplanting to the field, the beds should be soaked well so that the plants can be easily removed. In taking up the plants, it is better to dig them with a spade, rather than to pull out by hand, which is the too general practice.

Seeding Directly in the Field—In sections having a long season, tomatoes may and sometimes are, planted directly in the field when the soil has become warm. This method is wasteful of seed, involves considerable labor in thinning, and is seldom practiced when toma-

toes follow a spring crop of spinach. Only varieties that mature in a medium or short season should be grown this way.

FIELD CULTURE

Except where following spinach or other winter crop, tomato land should be fall-plowed as deeply as possible. In spring, before the surface gets hard and dry, the land should be disced to kill weeds and get the soil into fine condition. The method of preparing for the plants and method of transplanting depends upon the locality and the soil conditions. In most sections, when setting for the early crop, it is easy to set the plants without watering if the soil is handled properly. Under such conditions, the field is prepared level and marked off in both directions and the plants set at the intersections if they are set by hand. In setting large acreages, however, much time and labor can be saved by the use of a horse-drawn transplanter. These machines, of which there are several types on the market, set the plants as well as they are usually set by hand, and can be used to water the plants if watering is necessary.

In dry sections and in most sections during dry seasons, it is necessary to water the plants as they are transplanted. This is almost always necessary in setting the late crop. If irrigation water is available, the simplest plan is to mark the rows with a plow. The plants are set the proper distance apart on the edge of the furrow and a small stream of irrigation water is turned into each row as it is set. Cultivation must follow within a day or two, to prevent a hard crust forming around the roots. At this time the soil should be worked toward the plants, thus beginning the bed which should be gradually formed for each row.

Another way to set plants under dry conditions is to haul a number of barrels of water into the field, placing the barrels across the field at convenient intervals. As the plants are set, a little water is poured about the roots from a can.

In transplanting tomatoes, the plants should be set as deeply as possible, usually four or five inches deeper than the plants were in the plant bed. New roots develop along the stem giving the plant a much larger and deeper root system than can be obtained when the plants are small and set shallow. Deep setting is of course more laborious than the customary shallow setting, but it encourages the plants to develop large, deep root systems, which enables plants to make use of the moisture in the lower soil. Deeper plowing than usual for tomatoes aids in securing the same result. Plants with deep roots are most assured of an even moisture supply, do not require so frequent irrigations, and do not suffer from the sharp fluctuations of alternately having too much and not enough water. It seems that many of the troubles affecting tomato plants in California are connected with their shallow root systems.

Irrigation.—In some parts of the state, satisfactory tomato crops can be grown with little or no irrigation, if the plants are given a chance to develop deep root systems. However, in most sections some irrigation is necessary, the number and frequency of irrigations being determined mostly by local conditions. Enough water should be applied to keep the plants growing steadily. Over-irrigation favors excessive vine growth and sometimes causes the blossoms to drop without setting fruit. The best method is to open a furrow alongside each row of plants so that the moisture can seep down to the roots without wetting or compacting the surface soil (fig. 3). Cultivation should follow promptly, throwing the soil toward the plants. For each successive irrigation, the furrow is made further from the plants and by mid-season a broad low bed has been formed, which is covered by the sprawling plants. Between the beds is the dead-furrow which may be used for later irrigation, allowing the water to seep down to the roots without wetting the surface on which vines and fruit are resting.

There are two periods at which water should not be applied—during the period when the first blossoms are open, and during the latter part of the fruit-ripening period. Irrigation at the earlier period will decrease the set of fruit, and at the later period will retard the maturing of the crop. However, in some sections where a late crop is grown for fall shipment, the practice is to irrigate just as the first cluster begins to bloom. This prevents the setting of early fruit and may encourage the development of a larger plant that will produce more late fruit.

Planting Distances—The planting distasce is determined by the variety, the soil, and the season at which the crop is grown. Early tomatoes grown under intensive culture, where plants are staked and trained to a single stem, as in the Merced district, are set 15 inches by 3 feet apart, this requiring about 12,000 plants per acre. Early varieties where not staked and pruned, are usually set about three by four feet, requiring about 3,600 plants per acre. The late shipping and canning crop, the varieties used for which generally make very vigorous vine growth, are set from 6 by 6 feet to 8 by 8 feet apart, depending on the locality and soil fertility. This crop then requires from 700 to 1,200 plants per acre.

The wider spacings are more economical of plants and labor than the closer plantings. Yet there is no reliable data available to indicate whether wide or close planting pays best. Centainly the rows must be wide enough to allow cultivation and irrigation and to permit easy passage for the pickers without trampling upon the plants.

VARIETIES

Selection of a variety adapted to the purpose and the location where it is to be grown is the first step in the production of a good crop. Unfortunately some lots of seed, while approximately true to name, produce fruit of poor type. It is high time that all growers of tomatoes should begin to pay close attention to the variety used, and to the source and quality of the seed. The cost of the seed is an insignficant item because of the small amounts used. One pound is sufficient for twenty-five acres in most of the ordinary methods of planting in California. The following varieties are now used extensively for the various purposes, or have shown promise for use in the state.

Earliana.—This is the earilest maturing variety. It is characterized by small, weak vines and bears medium to small red fruits that tends to be quite flat and rough, which are serious defects. Some strains are claimed to be of better type and more productive than the general run of this variety. It should be used only on a limited scale for extra early crop, if at all.

Bonny Best.—This variety is a week or ten days later than Earliana. It produces larger, smoother, rounder fruits, of a good red color. John Bear and

ROBERT A. SINDALL, *President-Treasurer* HARRY R. STANSBURY, *Vice-President*

Chalk's Jewel are varieties that are identical with Bonny Best when good strains are obtained.

Livingston's Globe.—This variety classes as a second early. It has medium sized, round, pink or purple fruits, which are firm and stand shipment well. It is used very extensively for shipping purposes throughout the southern states and in Mexico, but does not seem to be used much in California as yet.

Stone.—This is a late variety, having vigorous vines and large solid red fruits, which in good strains are smooth and nearly round. This variety has long been the standard for canning purposes in eastern regions, and is used for that purpose in California. It is also the sort generally grown now for the late shipping crop. Stone or Norton appear to be the most suitable varieties where it is desired to grow a "dual purpose" crop, that is, both for canning and for fall shipment.

Norton.—This is a selection from Stone developed especially for resistance to the Fusarium wilt, which is a valuable characteristic in many parts of the state where the soils are infected with the wilt disease. Otherwise, this variety is identical with the best-bred strains of Stone, and is suited to the same season and uses. Several competent observes are of the opinion that this variety will be of great value in California, as it was grown very successfully in several places in 1922.

San Jose Canner.—This variety is supposed to have come from Trophy, a very old variety. It has very large rank vines, and classes as very late in regard to maturity. Most of the common or "growers strains" of this variety produce very large, rough, flattened, red fruits. It is a heavy yielder if plants are started early enough in the season. This variety is not suitable for shipment, but is used most extensively for canning purposes in central and northern California. A few growers are said to have selected, improved strains.

More's San Jose Canner.—This is a recently introduced and much improved strain of the foregoing variety, having deep, smooth, meaty fruits, and should prove desirable for canning purposes.

SEED PRODUCTION

Comparatively few tomato growers are selecting and saving seed for their own use at the present time. Where one is engaged in tomato production over a period of years, it is well worth while for the grower to select and save sufficient seed for his own use. Improved, acclimated strains, the result of careful selection, seem to be very scarce in California. Experiments elsewhere have shown that seed selected by farmers from their own fields out yield commercial seed from two to sixty per cent.

Most varieties usually contain plants varying a great deal in vigor and yield, as well as in quality and type of fruit. In fact, it seems that many seed stocks are actually mixed, containing many plants of poor type or low yield. The procedure recommended is to

Conveyors

THE Chain is the backbone and weakest part of any Sanitary Cup Conveyor. Note that the Giant Conveyor has malleable chain, with three pieces in each joint, hinged on 5/16'' steel shaft, giving a bearing of one and one-half inches wide on each side of the hinge joint. This wide joint aids lubrication and holds the conveyor in a straight line without depending upon the conveyor track.

Our cast nuggets or blocks on which the conveyor slides are one inch wide and one and one-half inches long—flat surface. Greasing the track with heavy cup grease gives ample aud durable lubrication under the existing conditions. Roller bearings are next to impossible to oil and will not last in the steam heat and washing of conveyor.

Our cups are three to the foot, neatly and smoothly folded together, using no rivets, leaving them smooth and cleanly.

Compare our construction and prices:

Five-inch conveyor, 10 ft. long
$85.00 and $5.00 per foot

Ten-inch conveyor, 10 ft. long
$105.00 and $6.50 per foot

Sixteen-inch conveyor, 10 ft. long
$125.00 and $8.00 per foot

A. T. Ferrell & Co., Saginaw, Michigan

We Have Been Building These Conveyors for Thirteen Years

mark certain plants that show vigor, health and good type, about the time the fruits begin to ripen. The pickers are then instructed to take no fruit from the marked plants. A second inspection, two of three weeks later, will then enable one to judge of the productivity, quality and type of fruit. Those plants which seem desirable from this standpoint are selected. While the other plants marked at the first selection are discarded. It is best to save separately and to plant one row in the field the next year with seed from each of the selected plants. The rest of the seed from the selected plants can be mixed and used for the main planting. From the best row the next year, seed is saved in sufficient quantity for the entire planting the third year. Practically all of the benefit derived from selection is apparent in the tomato the first year after the selection is made. Selection simply isolates the best qualities present in the original variety, and the improvement over the average is usually sufficient to make the practice quite profitable. However, selection should be continued from year to year to eliminate any degenerate plants and to preserve and improve, if possible, the qualities of the original selection. Indiscriminate selection of good fruits without reference to the vigor, health, yield and type of the plant from which the fruit came will not result in much improvement, for even poor plants may produce a few good fruits.

Generally speaking the ideals in selecting tomatoes are: First, a vine that is large, vigorous, free from all disease and producing a large yield of fruit; second, fruits medium to large, well colored, smooth, and deep, approaching the rounded form as closely as possible; thirdly, fruits which, when cut transversely, show well filled cells and freedom from greenish spots and hard white cores.

Fruits on plants from which seed are to be saved should be allowed to ripen fully on vine. When large quantities are to be saved from a number of plants, the ripe fruit should be gathered at intervals and dumped into wooden barrels, where it should be pounded into a pulp. No water should be added—there will be sufficient juice in the pulp fruits to insure speedy fermentation. After standing until the gelatinous mass surrounding the seed is well decomposed, water is added. Vigorous stirring facilitates separation of seed from pulp. The good seed sinks to the bottom while the light seed, skins, cores and pulp rise to the surface where they can easily be removed. Several successive washings clean the seed thoroughly, after which they should be removed, spread in thin layers on wire or cloth screens, and placed in the sun or elsewhere to dry as quickly as possible.

In cleaning seed on a larger scale, a flume with catch basins is used to separate seed from pulp, and the seed is dried in rotating cylinders through which a current of hot air is driven.

CONTROL OF TOMATO DISEASES.

Damping Off.—This is a seed bed trouble which attacks tomatoes and all other plants grown in beds. It is due to several kinds of fungi which are often present in soils. These fungi attack the plants at the surface of the soil, causing the stem to shrivel and turn black, while the top soon falls over. This disease is most likely to do serious damage when the same soil is used year after year for plant beds. It is also likely to spread rapidly when the surface of the soil is kept damp continually. The control consists in using fresh soil in the plant beds each year; watering plants only when absolutely necessary, and then always in the forenoon, so that plants and soil surface may dry off before night; ventilating the plant beds as freely as possible if they are covered, and avoiding over-crowding of plants by transplasting to proper distance or by thinning.

Late-Blight.—This disease often appears in coastal districts on potatoes and tomatoes. It spreads only in moist cool weather. In southern California the late fall crop is sometimes very seriously injured by this disease when the fall rains come earlier than usual. Due to its irregular appearance, growers are seldom prepared to combat it, hence serious damage results occasionally. The effects of the disease appear soon after rains commence in the form of numerous black spots on leaves and stems. The spots enlarge rapidly if the weather remains moist, and soon the whole plant blankens and dies. Fruits in all stages of maturity are affected, having small dark spots which enlarge rapidly and soon involve the decay of the whole fruit.

The control consists in spraying the plants thoroughly with Bordeaux mixture whenever early rains occur and the disease threatens. The spray material is prepared by dissolving separately four pounds of bluestone and four pounds of unslaked lime (or six pounds of hydrated lime). Each solution is diluted to 25 gallons and the two are then poured together, making 50 gallons of the spray material. Where no special spraying machines for use on tomatoes are available, power orchard sprayers can be used to spray the tomato fields.

Fusarium Wilt.—This disease is caused by a fungus living in the soil, which enters the plant through the roots. When the disease once gets into a field, it spreads rapidly in succeeding years. The disease is said to occur in many parts of the state. It usually appears a few weeks after the beginning of hot weather the lower leaves of effected plants turn yellow and dry up. The stems, if split open reveal dark brown streaks in the woody portion. The disease advances rapidly and kills the entire plants, or sometimes only one of the main branches. There is no true wilting of the plant, in the ordinary sense of the word, connected with this disease. The control is to grow resistant varieties, of which the Norton seems best at present, though Marvel, an early variety, and Norduke, a late shipping sort, may be desirable under some conditions. These varieties were recently developed by the U. S. Department of Agriculture.

Summer Blight (Western Blight).—This trouble occurs very generally in the state and is known by several names. The cause is unknown. The disease usually appears about mid-summer and many gradually involve many plants during the season. Affected plants stop growing, the margins of the leaves roll upward, and the under sides become purplish. The leaves and tips of the stem gradually dry up, and eventually the whole plant dies. No satisfactory control measure can yet be recommended.

Root Knot.—This trouble is caused by nematodes miscroscopic worms which infect the soil and which enter the roots of tomatoes and many other plants, causing the characteristic swelling of the roots. Affected plants appear stunted and yellow, and die slowly. The trouble can always be recognized by pulling up the plants and inspecting roots. Extreme caution should

ATOMATIC DOUBLE SEAMING MACHINE WITH END FEED.

This completely automatic machine double seams or crimps ends on all types of round tin or paper cans at a rate of 60 to 75 per minute. It is equipped with automatic feed for ends either straight or curled flanges and has a range of adjustment for 1-½'' to 4¼'' in dia. by 1-¾'' to 6'' in height. The seaming rolls and chucks may be universally adjusted with housings, thereby maintaining perfect alignment when changing for sizes.

This Seamer is equipped with brake which is applied automatically when the drive is disengaged. The chuck spindles are equipped with a positive device which prevents bodies or ends from being double seamed over the chuck. The high speed bearings are fitted with bronze bushings and all parts subject to wear are of hardened tool steel.

The machine is not only adapted for sanitary cans, but also may be used for general line work and operated in connection with our automatic Beader and Flanger. Our No. 20 Double Seamer is furnished for gallon cans and other larger work.

McDONALD MACHINE CO.

Mfrs. of Automatic Presses, Can Making Machinery, Dies, etc.

7600 South Racine Avenue Chicago, Illinois.

be exercised by growers to prevent the introduction of the disease on vegetable plants or seed potatoes shipped from other sections. When once introduced into the soil, nematodes are very difficult to eradicate. Flooding the land for two or three months, through drying out of the soil over summer, summer fallow, and growing resistant crops for two years are practices that have been recommended. The small grains, the Iron variety of cowpea, and the velvet bean are some of the crops resistant to nematodes. One should always be sure that the soil used for plant beds is free from nematodes, for infected beds are often responsible for infecting a field and spreading the trouble.

Fruit Spot (Anthracnose).—This is caused by a fungus which attacks the fruit in damp weather in the fall. Sometimes the black circular spots of decay are noticeable when the fruit is picked, and such fruit should of course be destroyed. The more serious damage caused by this disease, however, is the decay of fruit during shipment or after reaching market. There was some complaint of this the fall of 1922. It is believed that spraying the plants with standard Bordeaux mixture will control the disease, if applied just before the fruit begins to ripen. Spraying of course entails the additional task of wiping the fruit as it is packed. Infected fruit should be destroyed. Seed disinfection may aid in preventing the trouble.

Mosaic.—This disease causes a mottled appearance of the leaves; the plants are stunted and usually die without producing much fruit. The disease is readily spread in the field by insects and other means. It has been recently reported as doing considerable damage in some places. Infected plants should be promptly pulled up and burned or buried. Probably the most important step in controlling the disease is to destroy the perennial weeds related to tomatoes, on which the disease over-winter. Horse-nettles, ground cherries and matrimony vines especially should be eliminted from the neighborhood of the plant beds and from the field as well, if possible. Tomatoes should not be grown after potatoes, for the volunteer potato plants which usually are quite numerous the year after potatoes are grown, would be a source of Mosaic infection to the tomato plants.

Blossom End Rot.—This is a common disease in most parts of the state, though the damage done varies much according to the season. The first stage occurs on either green or ripening fruits, as an irregular brownish patch at the blossom end of the fruit. If the trouble does not develop beyond this stage, as is sometimes the case, little harm is done. But generally the disease advances rapidly, developing a black dry leathery rot which may advance until the lower half of the fruit is decayed. The disease is usually associated with drought conditions, where the plants are not able on account of dry soil or limited root system, to take up moisture as fast as it is needed. The disease also of vines early in the season, and are then checked by insufficient moisture when the fruit is ripening. The prevention of this disease seems to lie in proper regulation of the moisture supply. Everything done to encourage development of a deep root system by the plant will also aid in preventing disease. Also, the selection of seed from plants bearing fruits not effected by the disease offers much hope for its control in succeeding years.

Failure to set fruit.—This is a frequent cause of trouble, especially at certain seasons of the yea Although the plants may bloom profusely many flowers may fall without setting fruit. One frequent cause o the trouble lies in the excessively rank vegetativ growth of the plant, which is likely to occur when the water supply is too liberal when the soil is excessively rich in nitrogenous matter. Another cause is the very low humidity of the air which often occurs in summer. This condition, in connection with high temperature and high winds, may cause most of the blossms to fall.

Avoiding too much nitrogenous fertilizer and irrigating sparingly if at all during the first bloom stage will promote a better set of fruits. Windbreaks an the selection of a type of plant having heavy foliage will be helpful in other cases.

For aid in preparing this circular, the writer is indebted to R. G. Risser of the California Vegetable Union; F. A. Dixon of the Canners League; S. W. Cunningham of the Southern California Canners Bureau and R. E. Smith, Plant Pathologist in the College of Agriculture.

A CATECHISM BY DR. IRONS

List, Ye Sauer Kraut Men.

(From a recent N. K. P. A. Bulletin).

Do you know that this office was opened July a year ago with but one person taking care of the work?

Do you know that within six weeks, it was necessary to add another person and when the first ad appeared, six weeks later, two more went to work there, making four in all? These four were continually employed, and three weeks ago another was added. And yet with all this force our correspondence is so heavy that it is almost beyond us to keep up. We are feeling our way along, planning and devising new methods, filing systems, etc., so as to keep from adding more help. But if the present heavy mail continues to increase, nothing short of more help will relieve the situation.

Do you know we receive on an average of 3,000 pieces of first class mail per month since the campaign started?

Do you know that we started with one borrowed typewriter, two rooms and two desks? And that we now have four typewriters, five desks, one addressograph and a mimeograph machine and have been compelled to secure two more rooms for more desk and filling purposes?

Do you know that we received five thousand four hundred letters in December and seven thousand two hundred forty-one in January, and on the 11th of this month we received the largest mail since we began the Advertising Campaign which was six hundred forty eight letters—no business letters included?

Do you know that we are receiving more letters from those we have sent the booklets to—thanking us and expressing their appreciation and requesting more booklets? Also many letters saying that they have been reading our ads for some time and now was sending for the literature. This is accumulative advertising.

Do you know that up to February 1st, we have received coupons from one thousand three hundred seventy-one domestic science teachers all over the United States requesting a supply of the booklets for their classes? We have mailed twenty-nine thousan

six hundred forty booklets to these teachers since last October when the first ad appeared in the Normal Instructor. These average twenty-two to each teacher, one for each pupil in their class. It is well to reflect that many of these booklets reach the pupils' homes.

Do you know that these pupils will be the heads of families tomorrow? Think what this is doing toward establishing the consumption of sauerkraut a few years hence.

Do you know that we have received over fifty thousand letters from consumers besides those above mentioned?

Do you know that we have printed and distributed aproximately a half million copies of the booklets "Sauerkraut as a Health Food" and the pamphlet "The Story of Sauerkraut" to all sources of inquiry?

Do you know that sauerkraut now is being served in homes, finest hotels, grills and dinning cars that never served it before?

Do you know that large manufacturers who have their own dining rooms are now serving sauerkraut that never did before; and that large banking institutions, mail order houses are now serving sauerkraut regularly in their dining rooms that only occasionally served it before?

Do you know we really believe that we have more results for the amount of money expended than most any other article that has ever been advertised?

Do you know that experienced advertising men unanimously agree with us on this assertion?

Do you know that while we have enjoyed wonderful progress in this work, the surface is only scratched?

Do you know there were twice as many kraut packers back of the advertising campaign last year than in the previous year?

Do you know that the sales of sauerkraut have increased among the jobbers from twenty to fifty per cent? And one chain store operator reports that their sauerkraut sales last year had increased 74 per cent.

Do you know that we have already received signed 1924 Advertising Agreements since mailing them a few days ago?

Do you know that among these were the agreements of some kraut packers who had never before supported the Advertising Campaign?

Do you know that if we are to maintain the prestige so far gained we must back it up by the best quality of sauerkraut that the packers can produce?

Do you know that we have before us the copy for the ad that will appear in the Ladies' Home Journal in May featuring Sauerkraut Salad recipes for summer uses of sauerkraut?

Do you know that with more contributors to the advertising fund we will be able to give more summer publicity to sauerkraut?

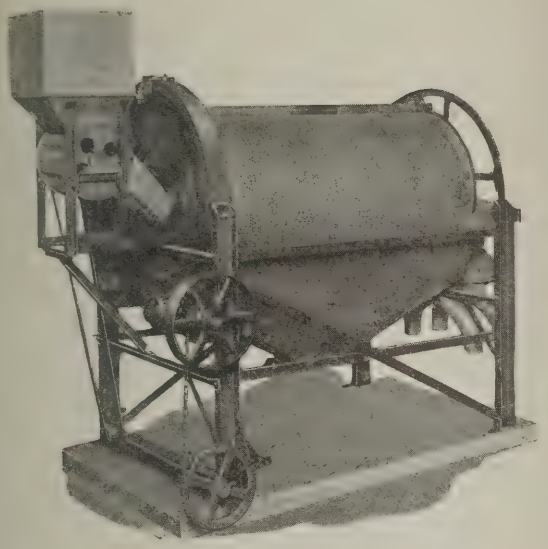
It is hoped that this will aid you to a better knowledge of just what the Advertising Committee has accomplished in bringing sauerkraut closer to the front page of food annals.

We believe that every kraut packer will give these facts their honest consideration, for this is but a description of an organized effort to promote and steady their own business. And by the same token, it behooves them to lend a hand.

What We Grow
and
Where We Grow

PEAS On the Western slope of the Rockies, where sunshine and irrigation make an ideal growing condition for bright, clean seed.

BEANS Also in the Mountain States, where the dry climate and clean atmosphere reduce the chance for plant diseases to a minimum. Idaho seed Beans are famous.



CORN Golden Bantam in Northern Michigan, a hardy strain of strong vitality. Al other varieties in the famous Indiana Corn Belt, whose limestone soil produces the finest of seed.

"NOW BOOKING FUTURES 1924 CROP"

The Nested Sample Grader—

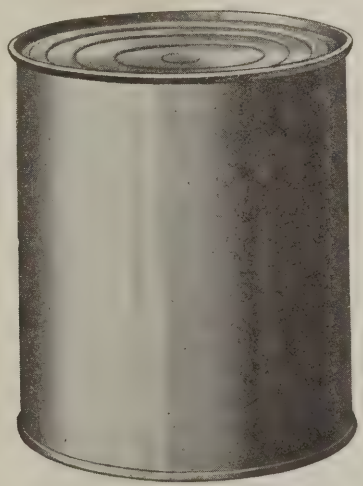
Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

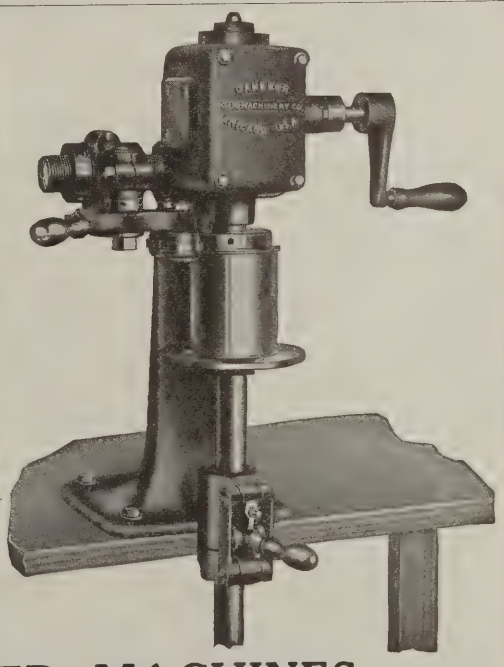
It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.



Manufactured and Sold by



Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

CAMERON HAND OPERATED MACHINES

This double-seamer attaches bottoms to can bodies and covers to filled cans. The Compound Applier spreads the rubber cement on the edges of the can ends. These machines are suitable for cans from 2" to 6" in diameter and up to 9" high.

GAMSE HAS ATTRACTIVE CALENDAR.

H. GAMSE & BRO., the well known label men of Baltimore, have gotten out an attractive calendar in ten colors. They are busy now sending it to their canner friends, but if you have not received one drop a line to them and we are sure they will gladly send you one.

The Gamse house boasts the blue ribbon, first prize, awarded by the Typothetae Federation Convention of the Fourth district. This is for offset lithography, and it is a feather they very properly sport in their caps. They have one of the most extensve equipments of their kind in the country. They are, therefore, well able to care for all canners' business in labels.

COLBERT "CALLS" THE TURN THIS TIME.

Preston, Md., March 17, 1924.

Mr. A. I. Judge, care The Canning Trade, Baltimore, Md.:

Dear Sir: If you will refer to last week's issue of the American Grocer you will find where Thomas J. Meehan & Co. quote future tomatoes, No. 2s, at 85c., and No. 3s at $1.25 Peninsula, and we have called up every broker on the Peninsula and all of them positively claim the best they have is 87½c and $1.27½.

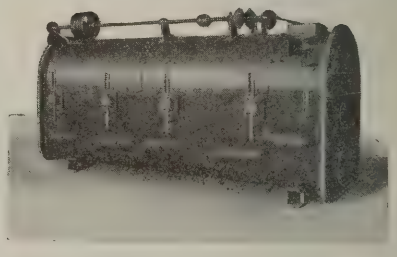
Now when we did things like this in the past a certain interest took great pleasure in trying to make things for us as unpleasant as possible.

This letter referred to is an open letter sent to Meehan's connections and a copy of same published in the American Grocer.

With prices of raw stock likely to be higher than first anticipated, canners cannot possibly make money at this price, and it is suicide, in our opinion, to sell on this basis at this time.

Yours very truly,
COLBERT BROKERAGE CO.

"CANNING NOTES" APPEARS AGAIN.



WE have been favored with an advanced copy of the new "Cannery Notes," reissued by the Sprague-Sells Corp. This is its third time on earth, or in the mails, as you choose. "Dan" Trench, in the hey-day of the Sprague Canning Machinery Co., originated it as a little house organ to carry the message of his long list of canning machinery. It grew and waxed strong, but was ultimately blended with The Canner, after Trench took over that journal. Still later the Sprague Company began its publication, and with "Bab" (Leland A. Babcock) as its editor made quite a name for itself, until changing fortunes again silenced it.

Now, with Ned Sells as its editor, it has again blossomed forth, more attractive and more scrappy, if possible, and certainly as "easy" to read as ever. And there is always good "stuff" in it, a good variety, titbits of news, helpful suggestions, a scientific or practical article or two, a joke column, and of course some pertinent paragraphs about some of the canning machinery put out by this big combination. It comes from the Sprague side of the house, edited by a scion of the Peerless branch, and will be welcomed by the whole industry. Glad to see you back, Cannery Notes, and hope you stay longer and prosper.

D. E. WINEBRENNER CELEBRATES GOLDEN JUBILEE.

THE D. E. Winebrenner Co., of Hanover, Pa., have been canning peas, string beans and corn for fifty years this season. They began in 1874, in a small way, of course, but long ago increased their facilities and now have one of the modern factories of Pennsylvania. Their goods are well known by the jobbers.

They celebrated this event by sending their friends a very neat paper cutter and envelope opener made of genuine bronze, bearing a tablet commemorating the occasion.

We congratulate them on their long and honorable career, and hope that they may have many more successful and happy years ahead of them.

D. E. GREBB NOW WITH THE INBUSCH CO.

MR. D. E. GREBB, formerly manager of the Wisconsin Canned Foods Department of the F. F. O'Brien Brokerage Co., Milwaukee, Wis., is now affiliated with our organization. Mr. Grebb will take full charge of the Wisconsin Canned Foods Department in the same efficient manner as heretofore with the F. F. O'Brien Brokerage Co., having discontinued operating their business.

The addition of Mr. Grebb to our forces enables our Wisconsin Canned Foods Department to offer:

To Wisconsin Canners—A nation-wide sales service.

To Canned Foods Buyers—A continuous supply of Wisconsin canned foods.

To Associates—A complete field service.

FRANK A. INBUSCH CO., Milwaukee, Wis.

CHISHOLM-SCOTT IMPROVE THEIR VINER SHEETS.

WE quote a circular recently sent out by the Chisholm-Scott Co., announcing some changes in their well-known machine of more than ordinary interest. It reads:

March 7, 1924.

To Our Customers:

We beg to advise that, after considerable experimentation, we have adopted an improvement to the viner in the shape of a new design perforated rubber screen, upon which we have received a patent from the United States Government.

Our perforated rubber sheet is divided into three sections, and apertures for all sections have heretofore been 5/8" in diameter. On our new screen the apertures of the first section, which is the one nearest the feed end of the viner, are 1/2" in diameter, and the apertures in the second and third sections are 5/8" in diameter. The smaller apertures in the first section act to prevent any pods falling through to the viner apron unthreshed, and thus lost. Such pods are retained in the cylinder and brought into contact with the beaters and properly hulled.

In addition we have constructed our punch presses for both the 1/2" and 5/8" apertures, so that a greater number of apertures are provided in each section, and the sifting capacity of our new screen is increased about 12 per cent over our previous screen. The value of such increase in the sifting capacity is obvious.

The price of our perforated rubber sheets for 1924 will be $9.00 each. This is an increase of $1.00 per sheet, as compared with 1923, but this increase is chargeable solely to the increased cost to us by the manufacturers, and no attempt is being made to charge off the expense of constructing new punches, etc., or to take advantage of the fact that our new design perforated rubber sheet is a patented article. It is, perhaps, needless to state that, in the manufacture of these sheets this year, we will continue to use the same formula that has given such splendid results in past years.

The adoption of this sheet can be made by our customers at practically no extra expense, since the first section of the present rubber sheets now being used may be cut away and used elsewhere, and sections of the rubber sheets with half-inch apertures attached in their places.

We obtained the idea originally for this new design perforated rubber sheet from Wm. F. Christel, of Valders, Wis. The adoption of this new part for the viner is but a further evidence of the fact that we are always on the alert to make real improvements in the art of vining green peas, and to maintain our policy of making no change in our viner unless it is proven to our satisfaction that the benefit is fundamental and not merely superficial.

PURELY MEDICAL REASONS

The Markets

BALTIMORE, MARCH 24, 1924

WEEKLY REVIEW

usiness in Canned Foods Is Proceeding in a Good, Steady Way. Jobbers Trying to Increase Their Profits by More Frequent Turn-over—Buying Often and in Small Quantities—The Heavy Penalties Being Paid by Canners Who Are Not Well Informed.

BUSINESS RESTING—From most sections of the country come reports that business in canned foods is quiet; that there is a steady but small volume business passing all the me, but it is to be observed that no one reports any weakness either the spot or future situations. There are those who ink that the jobbers have gone on a buyer's strike. This is not all true. Read the Chicago market report this week and note e jobber quoted there by "Wrangler." The day has long since ssed when either wholesaler or retailer can be neglectful or interested in canned foods; they constitute too large a portion of their business, are in too rapidly increasing demand the consumers to be neglected, for these good traders miss no portunity to turn an honest penny. And they should not. We metimes think that if the canners were, individually, as much terested in the distribution of canned foods as are these two terests, the canned foods business would be in very different ndition as a rule. The jobbers and the retailers do not select nned foods half as much as do the canners of those goods.

The situation is thoroughly sound, strong and very hopeful. nsumption is proceeding at a very satisfactory rate; the ods are moving off the shelves, not in any burst or spasm, t in a steady, even flow which denotes solid appreciation and growing taste. And the volume is large enough to cause nned foods to move into the staple class in the minds of all ndlers. They just know that the goods will sell, and conue to sell, and that they can buy just so many cases weekly, monthly, and know that they will be gone by a certain time. nd they feel confident that their jobber will take care of them ith these five or ten case lots as wanted. In turn the jobbers ow that the retailers will be there to take up the average nount of goods which experience has taught them is usually ken, and with this important branch of their business runng along smoothly they are turning to ways and means of imoving their merchandising methods. Chief among these, in te years, is to turn stock more often than they used to do. stead of turning once or twice or four times a year, they are w planning to turn it at least twelve times a year, and 52 nes wherever possible, and it is in the staples that they exct to meet this possibility. That is what is at the back of the pparent slowness in buying, and not any distaste for canned ods, not any buyers' strike or other moving picture stuff of at kind. It is just good, solid business that is trying to make do what two, four and even fifty dollars formerly did.

E. F. Brewster, a wholesale grocer of Rochester, N. Y., speaking before the Convention of Pennsylvania, New Jersey and Delaware wholesale growers, at Wilmington, last week, advocated buying in small lots—not just canned foods, but general buying by the wholesalers—and in the course of his remarks is quoted as saying:

> "The advantages or disadvantages of small lot purchases as a principle simply resolves itself into the much mooted question as to whether the buyer wishes to speculate in business or not.
>
> The only disadvantages of small lot purchases, as I see them, are the danger of being out of goods and the impossibility of making any speculative margin on advancing markets. If very careful attention is paid to the buying, however, there is no necessity for being out of goods, and aren't the market declines about equal to the market advances on a ten-year average, when we consider our line as a whole? So I believe that the jobber who confines himself to small lot purchases, according to the volume of business he does, year in and year out, will make a better financial showing in the long run than the jobber who buys in large quantities with the hope of either making a speculative profit on advancing markets or in order to get special discounts or carload allowances given for quantity purchases."

And further on he continued:

> "Interest on borrowed money will be less because of the smaller stock carried when making small lot purchases; profits will be greatly increased on account of faster turnover. As a fair example, let us assume a business with sales of $2,500,000, turning over six times a year. This will give you an average inventory of $416,666.60. Six per cent on this investment is $25.000, insurance at 8½ cents a hundred would be $354.16, making a total of $25,354.16. Now, let us see what happens with the same sales with an eight times stock turnover. Turning your stock over eight times would reduce your inventory to $31,500 your insurance cost at 8½ cents $265, these two making a total of $19,-015.62. In this instance of increased turnover from six to eight times your investment and insurance show a saving of $6,338.54.
>
> These figures should prove the advantages of small lot purchases as a principle. With your increased turnover you have reduced your floor space, you have eliminated danger of being caught on market declines and you are assured of fresh stock."

THE MARKET—There is nothing to be added to what we said last week. Our market pages show that there are no changes in prices, and if there is any weakness in either spots or futures it is coming from the canners who are not posted on conditions, who seem to make no effort to inform themselves on market conditions, or in other words let someone else attend to their business for them. The canner who knows that spots are all cleaned down to the vanishing point; that the East has all the spots in tomatoes, peas and corn, to say nothing of other lines, is not worrying about what spots he has on hand,

unless it is because he has not more of them. And certainly he is not considering lower prices for them. More than that, when the jobber comes into the market for his small buying the well posted canner is not letting go of "just these little blocks" below market prices, but is charging him more because of the retail nature of his purchases, is putting from 2½ to 5 cents per dozen on the price to cover handling in small quantities.

And the same thing is true in futures: the well-posted canners are not reducing their prices, they are advancing them as one section after another becomes sold up and withdrawn from the market. And there are more and more being withdrawn from the market. And there are more and more of them withdrawing as the days go by. There is no reason in the world why the tomato canners of the Tri-States should not be selling their futures on the same basis as Indiana, for instance—except again that the uninformed canners fall easy victims to the crafty buyers and their agents. It is the canners' own fault and nobody else's.

Nothing of moment has happened in the market this week. Below we give the reports of some brokers on the situation as they see it.

NEW YORK MARKET

Future Sales Are Running Ahead of Previous Years—Western Future Corn Especially Good—Buyers Taking Spots in Small Lots—Canners Are Firm on Spot Tomato Prices—Fancy Corn Is Ruling High for Spots—Notes of the Trade.

New York, March 20, 1924.

By "New York Stater,"

Special Correspondent "The Canning Trade."

BUSINESS Brisk—Satisfactory canned foods business is reported among members of the local trade, and the market is developing gradually as spring buying increases. Future sales of canned vegetables are running far ahead of those for the same period last year, and many canners are even now withdrawing from the field, after having booked sufficient volume to take care of all of the pack they are willing to gamble on getting. Business in future standard corn in the Midwestern territory has been exceptionally good, while pea sales have also been heavy.

Spots Hand to Mouth—On the spot position, buyers cannot be talked into expanding their operations, and brokers report that the volume of spot sales is good, but add that "they have to work hard for every nickel they make," referring to the fact that distributors are buying in such small quantities. A fifty case lot sale takes just as much (if not more) energy as a carlot sale generally does, and the results from the broker's standpoint are far divergent. However, buyers generally appear to be of the opinion that any heavy buying on their part would probably start a sharp upward price movement in the lines wanted, and they are doing their utmost to hold the market stabilized for the remainder of the season.

"Joe" Allen Dead—Joe Allen, one of the most popular men in the food trade in this city, died suddenly at his home March 18th. He was associated with North & Dalzell as manager of their dried fruit department, but had been all through the food game in California, having been connected with several of the leading houses in the business during his career. He was popular with buyers and his fellow-brokers alike, and his passing will be mourned by all of his late associates in the industry.

Southern Tomatoes—While there was a fair inquiry for tomatoes for factory shipment during the week, the volume was not up to expectations and the market showed no quotable change. Canners appear confident that a strong demand is being withheld, however, and they are very firm in their views, particularly on No. 2s, which appear to be in lighter supply than many buyers are willing to admit. Futures developed no new features during the week, trading being routine.

Indiana Tomatoes—Indiana packers continue to offer futures on the basis of $1.00 for standard 2s, $1.35 for 3s. It is reported, however, that a little business has been done at prices slightly under these figures.

Standard Corn Quiet—With the market for both spots and futures standard corn held at 92½ cents, f. o. b. cannery, there has been a continued quiet movement in this commodity, with buyers operating only for their immediate needs. The above refers to Southern corn. Midwestern corn canners report that their business on future corn is running far ahead of that of last year. Standards are quoted anywheres from 95 cents to $1.00 per dozen, f. o. b.

Fancy Corn High—Maine canners who were able to hold back small quantities of fancy corn from the 1923 pack are now being amply repaid for their foresight. During the past week it is reported that small sales were made for factory shipment up to $2.10 for fancy Golden Bantam and $1.75 for fancy Crosby. Business on future Maine corn has been good, and offerings now are not large.

Pineapple—Reports from the Coast state that the 1924 pack of Hawaiian pineapple is not expected to be any larger in the aggregate than the 1923 pack. Despite this, however, jobbers in many parts of the country are rather bearish on pineapple, owing to the recent break in prices, and it is believed that stocks in the hands of distributors, both wholesale and retail, are fairly large for this season of the year.

California Spinach—Some of the California spinach packers are said to have decided not to pack this season, and the market appears rather weak. It is reported that some of the smaller canners have cut the market under the opening price basis.

Notes of the Trade—The Atlantic and Pacific Products Corporation, a subsidiary of the Great Atlantic and Pacific Tea Company, has acquired property at Hindsburg, New York, and will erect a tomato catsup cannery there. The Corporation has already contracted considerable acreage for the coming season.

P. E. Emerson, of S. E. Comstock & Co., well known canners of Newark, New York, was a visitor in the trade during the week.

Earl Withgott, of the Talbot Packing and Preserving Co., of Easton, Md., was another visitor in the market.

Bacon and Trubenbach, Inc., have just been appointed sales agents for three well-known shrimp canners, the Sea Island Canning Co. of Supplee, Ga.; South Atlantic Canning Co. of Fernandino, Fla., and Cedar Point Canning Co. of Crescent, Ga.

J. J. Farley, of J. J. Farley Co., Inc., Winslow, New Jersey, was one of the out-of-town trade members on Hudson street during the week.

E. L. Heebner, president of J. M. McNiece Co., Inc., is back from a trip to California, where he visited his firm's principals.

Paul Fishback Secretary of the National Food Brokers' Association, was here during the week.

An inquirer at a broker's office this afternoon asked the manager of the canned foods department what made canned corn a little black once in a while. "That's easy," said the broker, "the same thing that makes the wildcat wild."

CHICAGO MARKET

Corn Holdings Growing Too Small to Mention—No Peas and No Tomatoes in the Central West—Demand Is Dull—Good Shipping Weather—One Jobber's Opinion of Why More Buying Is Not Being Done — No Selling Between Jobbers in This Market — South Bend Wants Cannery.

Chicago, March 21, 1924.

By "Wrangler,"

Special Correspondent "The Canning Trade."

CORN—The statisticians of Iowa and of Ohio have quit counting the stock of corn remaining unsold in those States, all being sold or the quantity remaining being too small to mention.

Indiana and Illinois still have some canned corn of the 1923 pack, but they are not making any fuss about it, evidently feeling that their favorite customers will need it a little later along.

There are not enough spot canned peas left in Wisconsin to start a conversation about, so I will say good-bye to them and begin to talk about the 1924 crop, which is also well sold ahead.

There are no tomatoes in the Central West to talk about, not even to whisper about, so there goes another subject for conversation. If this situation goes much farther in the direction it has gone, I will have to quit writing to you and arrange to take a long fishing trip until after the crop of 1924 gets into the cans and begins to arrive in market.

The interregnum coming after Canned Foods Week and its activities still prevails, and the demand for canned foods of all description is dull, and everybody seems to be taking a "smoke and a think," chiefly a smoke, over the situation.

The weather has moderated and is a little snowy, but almost as mild as spring, and all shipments of canned foods are going out promptly when ordered, but they are not being ordered as freely, or as frequently, as the dealers would like, or as they

have a right to expect.

One buyer said to me when I asked him why he was holding out of the market and buying no goods: "Who said so? I am not! Wattell is the use of trying to buy canned foods when you can't buy them and when there are none to buy? I would buy some fancy twos, threes or tens tomatoes, or some extra standard twos, threes or tens tomatoes, or some extra standard or fancy threes sieve Alaska peas, or some fancy fours sweet peas, or a dozen grades or kinds of canned foods, but where are they? Lead me to them! Don't tell me that I am holding out! I need goods, and am in the market and not 'hollerin'' about the price. I want the goods. Dig them up and bring them to me first, and the other fellow won't get a chance at them."

His position seems reasonable, don't it? But isn't it amusing to find the market in that kind of a situation so early in the selling season, and when we all know that there was a big output of most kinds of canned foods?

Wholesale grocers are not selling canned foods to each other in this market. They won't job their holdings, turning the brokers away with the statement that they have no canned foods to spare, and have only supplies for their own regular customers.

South Bend, Ind., wants some reliable and responsible canner to come there and establish a canning factory, either in the city or in the vicinity. It is a city of about 90,000 population, and a big manufacturing point. The Studebaker Automobile plant is there, and the Oliver Plow plant, and a dozen other big factories, and labor conditions are good, with an abundance of white labor.

The city is located on the St. Joseph River, about ten miles south of the Michigan line. The land is as fertile as any in the world, but it is too high-priced to raise corn, oats, potatoes and wheat on, and the tenant farmers—Germans, Hungarians, Poles, etc.—know how to raise canning crops and want to cultivate and raise crops that will pay them a profit.

If you are interested, write to P. E. Bondurant, banker, South Bend, Ind. He has been made chairman of a committee by the Chamber of Commerce to secure the locating of one or more canning factories there. They have one of the finest newspaper plants there in the United States, owned by the South Bend Tribune. It cost $300,000, and is strictly up to date. There are two daily papers there.

I spoke there during Canned Foods Week to the Chamber of Commerce, the University Club and to the Lions Club, and a finer lot of people I never before met. They were all deeply interested in the canning industry. The city has a supply of the finest water, with fine roads reaching out in all directions; has five good wholesale grocery houses and a whole lot of good retail grocers. The country will grow tomatoes, sweet corn, peas, sweet potatoes, cabbage, green and white beans, and there is a good supply of fruits and berries, I was told, up toward the Michigan line and along the St. Joseph River, upon which South Bend is located.

MAINE MARKET

Business Quiet—Future Corn Has Sold Well—Acreage Slow in Coming in—Canners Nearly Sold Out on Both Corn and Beans.

Portland, Maine, March 21, 1924.

By "Maine,"

Special Correspondent "The Canning Trade."

Business—After a little improvement during February in general trade conditions, business has remained quiet during the past month. Local buyers are taking in stocks in limited quantities only for current needs, and report that their sales are also small. While we have had a very mild winter and there is every indication of an early opening of spring, general business lacks the stimulus usually accompanying this season of the year. The Maine Publicity Bureau, however, anticipates a very heavy summer season, based upon the bookings and inquiries already received, and this will go far in averaging up the year's business.

Future Corn—Future corn has sold well ever since the first offerings were put upon the market. And unless acreage comes on more freely in the next month there will be little if any more futures to offer. The canners wish to be conservative in their sales, and will probably withdraw when their contracts amount to 80 per cent of their anticipated production. $1.45 and $1.70 for Crosby and Golden Bantam varieties have been firmly adhered to, and have evidently been satisfactory to the trade, to judge by the sales made. Cans are costing more, the price to the grower had to be advanced this season, and everyone knows that labor costs are continually going up. Even at $1.45 and $1.70 the canners are making less money per dozen than usual, owing to these increased expenses.

Beans.—Stringless beans are even nearer sold out on future contracts. The acreage has been increased this season, and even now the supply will not meet the demand. $1.30 for twos and $6.00 for tens have been the uniform prices from all canners, and in some instances twos have brought $1.35 for special packs.

MR. BROOKS COMMENDED BY THE MAINE CANNERS' ASSOCIATION.

At a regular meeting of the Maine Canners' Association, held in Portland, Maine, February 14, 1924, the following resolutions were adopted, namely:

Whereas, Mr. Edward H. Brooks has accepted a well-earned relief from the more active duties which he has heretofore performed in our State, and

Whereas, his always pleasant and obliging personality has won the esteem of members of this Association with whom he has had business relations;

Now, therefore, be it Resolved, That while it is realized that in the retirement of Mr. Brooks from his more active business relations with us he has acted in accordance with what was for his own best interests, the members of this Association feel a real personal loss.

And be it further Resolved, That the best wishes of the members of this Assocaition be extended to Mr. Brooks for the enjoyment of that freedom which his new status permits. All of which is extended to Mr. Brooks with the hope that he will, nevertheless, find it convenient and pleasant to be frequently with us as heretofore.

W. E. ELWELL,
JAMES P. BAXTER, Jr.,
Committee.

Official: JAMES W. LANIGAN, Secretary.

ST. LOUIS MARKET

Trade Quiet—Conservative Policy Shown by Buyers—Corn Quiet—Corn Futures Soon to Advance—Jobbers Need Peas—Early Delivery on Futures Needed to Relieve the Shortage—Any Shading in Tomato Prices Taken Advantage Of—Indications for Fruits Are Bad.

St. Louis, March 20, 1924.

By "Missourian,"

Special Correspondent "The Canning Trade."

TRADE Quiet—There is no especial change in the canned foods situation here. Brokers and distributors report trade as rather quiet. There is some "pick-up" trade for immediate requirements, but not enough for the future. The spot canned foods movement is not what it should be for this season of the year, according to general reports. Distributors are doing business on a hand-to-mouth basis. Their holdings show no actual need for buyin freely. The most optimistic reports come from the jobbers and wholesale grocers, who are moving their goods, are making frequent "turn over" of light stocks, and are not investing in any one commodity. Brokers are doing little in the way of spot or future trading. In fact, the distributors are doing most of the business. Many items are firm as stocks, held by distributors to see them through the season, are light. Futures are marking time. No heavy bookings on any one item are reported.

Corn—Standard offerings on the spot are moderate and full prices are obtainable. There is not an over-supply either here or in the country. Some of the fancy brands, like fancy Crosby and Golden Bantam, are scarce. Future lines are firm, a fairly satisfactory business having been placed. Maine canners, who have brands that are well established, are sold up. They are not looking for business. It is the same with Middle Western packers. While canners of standard packs are taking business at 92½ to 95c, some of them have informed their brokers that they will soon advance prices to $1.00. This is because the packers do not want to think they have sold out too cheaply. Quotations and points of destination are: No. 3 fancy Crosby, Minnesota, $1.30; No. 2 Golden Bantam, fancy, Minnesota, $2.00; No. 2 standard Evergreen, Wisconsin, $1.00; No. 2 extra standard Evergreen, Wisconsin, $1.05; No. 2 extra standard, Illinois, $1.00; No. 2 standard, Iowa, 95c; No. 2 standard, Ohio, 90c.

Peas—Jobbers are badly in need of peas, as they have about sold out, and it is hard to replace them, even when full prices are offered, because holdings are restricted and are confined to second hands. Holders do not care to liquidate with the market advancing. Standard sweets are held at $1.40, f. o. b. Some future trading is being done, but it is hard for the buyers and sellers to get together on a price basis and on assortments. Southern early June futures are quoted at $1.20, f. o. b. Early deliveries are desired in order to relieve the shortage which promises to be acute by the time new peas are packed.

Tomatoes—Tomatoes are steady at the prevailing factory prices. Buying is light. The majority of distributors are covering as they need them. Any price shading is being taken advantage of, which is being done in a small way. Futures, either California or Southern, are not much in demand. Southern No. 2s and No. 3s are maintained at country quotations. There is no demand for large blocks. There are enough spot stocks to be had at practically factory prices that are taken up in small blocks as needed, rather than on a carload basis. Small sizes are most in demand. Canners and jobbers have not come together yet on a mutually satisfactory range of future prices.

A well-known broker in discussing tomatoes said he saw higher prices on 1924 tomatoes. "While many factors have entertained the hope that future tomatoes would reach lower levels," he said, "indications are that today's future market is as low as it will be. The small packs in Indiana and Illinois, coupled with the fact that stocks are rapidly being reduced, pressages, in the opinion of well-informed operators, an early demand from the Middle West. Contracts have already been made with some of the large distributors on futures." Quotations on futures, f. o. b. at point of shipment, are: No. 1s, standard, 10-oz., 60 to 62c per dozen; No. 1s, tall, 15-oz., 75 to 77½c; No. 2 standard, 90c; No. 2 standard, 95 and 97½c; No. 2½ standard, $1.20 and $1.25; No. 3s, standard, $1.30; No. 3s, extra standard, $1.37½ and $1.40.

Miscellaneous—Asparagus will about be exhausted before the new goods come in. There is a fair demand for limas, stringless and string beans, succotash and beets.

Fruits—California peaches are growing firmer in standards and seconds and choice since the stocks of desirable brands are getting lower. Buying is rather restricted. If there was more buying, a speculative market might result. Apricots are about like peaches. Hawaiian pineapple is steady. Apples are steady.

According to the crop report of the Missouri State Board of Agriculture, just issued, the indications are that the peach crop ths year will be bad. Missouri farmers have more corn, wheat, oats and hay on their farms than they did last March. Cash rents are the same, local values average the same for crop lands, and farm hands' wages are slightly less than those of last year, but fruit blooms are only 74 per cent. as against 90 ver cent last year, and peaches are said to be 50 to 90 per cent killed in practically all sections of the State. Apples, cherries and pears, however, are not seriously hurt.

Advices have been received from Doniphan, Mo., that an organization of more than 100 farmers had been formed at that place to engage in the growing of strawberries as a commercial crop. About 200 acres will be set out this spring, and a still larger acreage will be planted in the fall. The growers expect to go on the market in 1925 with carload shipments of berries and develop the community as a strawberry center. Local business men are giving assistance to the movement. A large grower in the Arkansas field was there recently and examined the soil and pronounced it an ideal berry country.

CALIFORNIA MARKET

Crops Make Good Growth Under Excellent Weather—Owing to Lack of Moisture, However, Bumper Crops Seem Impossible — Mr. Chase Again Elected — The New Peach and Pear Sizes—Swells Settlement Approved — The Golf Experts— Asparagus Canning On— Coast Notes.

San Francisco, March 20, 1924.

By "Berkeley,"

Special Correspondent "The Canning Trade."

WARM Weather—The general rain of two weeks ago has been followed by warm weather and early crops have made a splendid growth, but the need for more moisture is evident everywhere, and the outlook is none too bright. Irrigation is the rule wherever water is available, and pumping plants are being operated months in advance of the usual time. In fact, there has not been a month during the past year that orchardists have not pumped water for irrigation, something never before heard of. The rainfall to date is less than one-third the normal in Southern California and the San Joaquin Valley, and there are but a few places in the State where it is half the normal. But three inches have fallen at Los Angeles since last July, as compared with a normal of twelve. The situation has reached a point where bumper crops are an impossibility and even fair crops scarcely possible. Now that Nature has fallen down on the job of furnishing sufficient moisture, man is preparing to prod the skies, and from the San Joaquin Valley comes the news that Rainmaker Charles M. Hatfield, who has a reputation in emergencies of this kind, has been employed to relieve the parched fields. He has contracted to produce rain at the rate of $1,600 an inch over a circle of the diameter of 150 miles.

League Officers—Following the recent convention of the Canners' League of California, held at Del Monte, the Board of Directors met and organized by electing officers as follows: President, Elmer E. Chase, of the Richmond-Chase Co.; vice-president, Leslie S. Smith, of the Kings County Packing Co.; vice-president, Frank A. Wilder, of the Pratt-Low Preserving Co.; vice-president and secretary, Preston McKinney, and treasurer, R. Bellingall, of the Pacific Coast Canning Co. The directors of the organization, fourteen in number, half of which are chosen each year, are: Elmer E. Chase, J. C. Ainsley, R. M. Barthold, R. Bellingall, G. H. Bradt, W. M. Field, W. A. Gellersen, George N. Herbert, C. E. Hume, D. L. Smith, Leslie S. Smith, Charles E. Virden, Frank A. Wilder and Leonard Wood. The Executive Committee named by President Chase is the same as last year, being composed of F. E. Booth, of the F. E. Booth Co., chairman; R. M. Barthold, of the California Packing Corporation; G. H. Bradt, of Hunt Brothers' Packing Co.; G. N. Edwards, of the Winters Canning Co.; W. A. Gellersen, of Libby, McNeill & Libby; H. E. MacConaughey, of the Hawaiian Pineapple Co., Ltd.; C. L. Tilden, of H. G. Prince & Co., and F. A. Wilder, of the Pratt-Low Preserving Co.

New Peach and Pear Sizes—Considerable discussion took place at the convention on the subject of the new peach and pear sizes from both the production angle and from the cannery angle and at the conclusion of this a resolution was passed that sizes for the coming season would be no smaller than those of last year. Canners realize that the future of the canned fruit business in this State lies in packing goods of the highest possible quality, and to this end every effort is being made to improve the size and quality of the fruit produced. Minimum sizes were increased last year, and growers at once responded with better thinning and cultivation in order to produce fruit that could be sold.

Swells—The question of swells also came in for considerable attention, and a resolution was passed unanimously approving the new arrangement under which some lines will take an allowance of one-quarter of one per cent for swells guarantee, while others will take an allowance of one-half of one per cent. Under this arrangement swells costs to California packers will be reduced materially, since most of the products packed in this State come under the quarter of one per cent allowance.

The Golfers—The golf tournament, which brought the convention to an end, was an exciting one, with many entries. C. E. Hume won the cup for the best gross score, and D. L. Smith annexed the flask for runner up in gross. R. M. Barthold landed the cup for the best net, while E. N. Richmond won the cigarette case for runner up in net. Harry Howell went home with a picture for making the highest score.

Asparagus—The canning of asparagus has commenced at San Francisco on a limited scale, and only surplus offerings in the fresh vegetable market are being handled. Operations in the Delta district will scarcely be under way before the end of the month. Many canners have contracts with growers for the delivery of grass at 4½c a pound, but as high as 7c is being offered on short-term contracts and in the market. Most packers have disposed of their expected output, and there is now little business being done in the new pack.

Exports—Exports of California canned fruits to England, Germany and France during February reached a comparatively high figure, and assisted materially in cleaning up stocks in first hands. Stocks in the San Francisco market are badly broken, and it is impossible to secure complete assortments. The strength of the market may be judged by the fact that virtually all operators are now securing the same price for their products, brands being lost sight of for the time being. At the opening of the season, when stocks are complete ,there is always quite a differential.

SEATTLE MARKET

Fruit Outlook Uncertain—Hard to Estimate Costs—Good Demand for Berries and Pears—Salmon Steady—Cohoes Scarce—Reds Are Slow—A Little Export Trade Showing.

Seattle, March 20, 1924.

By "Nomlas"

Special Correspondent "The Canning Trade"

FRUIT Outlook Uncertain—The market for future canned fruits in the Northwest is rather uncertain at this writing. Some of the canners have announced tentative prices, but here has not yet been any general formal opening.

Costs Uncertain—Canners are concerned over the costs for packing this season. They point out that sugar, labels, cases and cans will cost more this year than last, yet buyers' views are just about the same as last year's. It is not probable that the prices for 1924 pack, when named, will greatly exceed those for 1923 pack fruits.

Berries and Pears Sell—There has been quite a good demand for berries and Bartlett pears, and canners' holdings are practically exhausted. Export buying accounted for some of the demand for pears, while the domestic trade has been buying berries rather freely, particularly in No. 10s for the bakery and restaurant trades.

Salmon Steady—With tax time past, salmon holders are quoting the market rather firm. Spring buying is opening up gradually, but rather more slowly than some factors in the trade had anticipated. It is rumored that a little business was done on chums early in the month on the basis of $1.15. The pack was not Alaska or Puget Sound, however.

Cohoes Scarce—Alaska mediums and Puget Sound cohoes are reported to be practically a thing of the past with most packers. According to brokers here Cohoes will soon be unavailable at any price.

Chums Scanty—Good Alaska chum salmon is also in very limited supply, the market holding at $1.20 for shipment from Seattle. Many in the trade will have to swing to pinks at $1.25 for the remainder of the season. Pink halves are available in limited way at 90 cents.

Reds Slow—The market for reds has been rather slow. Talls are held at $2.25, with halves at $1.50. Medium red talls are to be had in a small way on the basis of $1.45 per dozen.

Export Trade—There has been a little export inquiry for pinks from the Canadian market, due primarily to the sold-up condition of the British Columbia salmon packers, it is believed. Buyers in the Philippines are also taking pinks in fair quantities for immediate shipment.

P. E. Harris & Co. Expand—P. E. Harris & Co. have announced that they are expanding the cannery end of their business, and have taken on an additional plant in Southeastern Alaska. The new plant is known as the Scow Bay Cannery, formerly owned and operated by G. W. Hume Company, of San Francisco. The cannery is located in the district of Alaska producing principally pinks and chums. It is a two-line plant, with a normal capacity of sixty thousand cases. "Our output of select Double Q Pinks and Fairweather Chums will be materially increased by the addition of this plant" the company advises. "It will be operated by Mr. Ed. Brennan, who has been with us a number of years at our False Pass plant, where it is now conceded by those who know that the finest pack of reds in Alaska is produced. Mr. Brennan will exercise the same care in operating the new plant that has made our False Pass pack justly famous."

What Canned Foods Distributors are Doing.

National Wholesale Grocers' Association Asks Jobbers to Keep Definite Record of All "Swells" Losses and to Furnish Accurate Statistics for Canners' Conference Committee.—Notes of the Trade.

TO KEEP Record of Swell Losses—Wholesale grocers are after the swelled canned foods problem in earest, and are seeking definite data to use in setting forth their claims after the present "truce" between canners and wholesale grocers comes to an end.

The National Wholesale Grocers' Association sent out today to all members a letter asking members to keep definite data on their swells.

Arthur P. Williams, chairman of the Canners' Conference Committee, in the bulletin says: "The National Wholesale Grocers' Association urges wholesale grocers to maintain individual and careful records of losses from swells and to file these records with the National Association for the information and use of the National Canners' Conference Committee in assisting it to protect the wholesale grocer. Few wholesale grocers have kept records in the past. As a result of the adoption of the cash allowance plan in lieu of normal swells by all factors, it is now essential and urgent that buyers maintain careful and accurate records the year 'round and report results to the National Association.

"Herewith is enclosed a record form, devised by and used successfully by L. W. Mallory, chairman of the Association's Contract Committee. It will yield the information every business-like wholesale grocer should have and which will be highly useful to the Conference Committee.

"This form is self-explanatory. Each individual wholesale grocer is urged to adopt and put this record in use immediately. On January 1 next the final record for 1924 should be forwarded to the National. Thereafter it should be forwarded for each six-month period."

A copy of the form devised by Mr. Mallory appears below, and should be of great value in determining actual losses, so that when canners and distributors once again get together to talk over the important problem, they will have definite data available from each element on which to work.

WHAT THE JOBBERS ARE DOING

John W. Morey, of the Morey Mercantile Co., well-known wholesale grocers, of Denver, Col., is on a trip to Eastern markets.

Campbell Holton, of the Campbell Holton Co., wholesale grocers, of Bloomington, Ill., was visiting in the New York trade last week.

H. M. Foster, secretary of the New York Wholesale Grocers' Association, was one of the speakers before the convention of the Southern New England Wholesale Grocers' Association at the Bond Hotel, Hartford, March 19th. C. E. Slasson is president of the Association.

Advance registrations for the National Wholesale Grocers' Association Convention in Chicago, May 27-30, are reported unu-

sually heavy, and those who are planning to attend are advised to make early reservations.

Wholesale grocers heaved a sigh of relief this week when Washington reports stated that the Packers' Consent Decree has been completely carried out in spirit, with the exception of the provisions relating to unrelated commodities and to stockyards. The provisions relating to unrelated commodities have been carried out in spirit, and the Department of Justice is now striving only to carry out the letter of the ruling, according to a report by Attorney General Daugherty.

Beyer Bros., wholesale grocers, of Kendallville, Ind., have solved the credit problem with their trade by placing their business upon a weekly cash basis, extending only seven days' credit.

P. M. Omstad is now manager of the business of the Grand Forks Mercantile Co., wholesale grocers, of Grand Forks, N. D.

E. C. Campbell has been named general manager of Solomon Wickersham Co., operating wholesale grocery business at Bowie, Globe and Safford, Arizona. Mr. Campbell was for a number of years associated with the Phelps Dodge Mercantile Co., of Bisbee, Arizona.

WHAT THE BROKERS SAY

Indianapolis, Ind., March 15, 1924.

Business has been a little quiet the last week, excepting on future corn and spot catsup, which have been quite active. Four Indiana corn packers are sold up for 1924 pack, the last sales of standard corn being made at 92½c for fall delivery. We have one packer, however, who will still take about 1,000 cases standard corn at 90c. This is a very good packer, with uniform quality, whose pack we sell to the same buyers both in the East and the West each season.

In spot corn we have some very good extra standard extra sweet at $1.05.

In spot catsup we call attention to the following:

1,100 cases 10-oz. Screw Cap Catsup.....$1.25
950 cases 14½-oz. Screw Cap Catsup..... 1.55
F. O. B. Seymour, Ind.
625 cases 10-oz. Screw Cap Catsup..... 1.25
165 cases 8-oz. Crown Seal Catsup..... 1.20
110 cases 8-oz. Fancy Catsup 1.25
30 cases 8-oz. Crown Seal Catsup..... 1.10
30 cases No. 10 tins Catsup..... 6.50
F. O. B. Washington, Ind.
175 cases 10-oz. Chili Sauce..... 1.85
F. O. B. Vincennes, Ind.

All the above subject to seller's confirmation and prior sale.

BERT C. KEITHLY CO.

Springfield, Mo., March 10, 1924.

Offerings of spot tomatoes are now reduced to only a few lots, and are held in firm hands. We quote the lots listed below at the lowest prices at which our canners are willing to confirm subject to canners' confirmation, and if unsold. None of these lots are available for buyers' labels.

About 1,000 cases No. 3 Std. Hand-packed Tomatoes, doz...$1.5
600-700 cases No. 3 Std. Hand-packed Tomatoes, doz..... 1.5
About 3,000 cs. No. 2 San. Std. Hand-packed Tomatoes, doz. 1.0
700-800 cs. No. 2½ San. Std. Hand-packed Tomatoes, doz.. 1.4
About 400 cs. No. 3 Caphole Std. Hand packed Tomatoes, doz. 1.4
About 2,000 cs. No. 2 Std. Hand-packed Tomatoes, doz..... 1.0
About 1,000 cs. No. 3 Std. Hand-packed Tomatoes, doz..... 1.5

Future Tomatoes—We renew our previous quotations on future tomatoes: No. 2 standards, 90c; extra standards, 95c; No. 2½ standards, $1.20; extra standards, $1.30; No. 3 standards $1.30; extra standards, $1.37½ to $1.40; No. 10 standards, $4.50. It is now next to impossible to confirm on smaller sizes.

With firm orders in hand we might be able to confirm a limited business for No. 2 standards, 87½c; No. 3 standards, $1.27½ f. o. b. shipping points.

W. D. MASSEY BROKERAGE CO.

Baltimore, Md., March 15, 1924.

Spot tomatoes were quite active throughout the week, especially No. 2 tins. The reaction is yet to come, but is expected shortly. With few exceptions, the present stocks were tucked away in strong hands at the close of the canning season last October, and for the most part the holders of tomatoes still have abiding faith in the ultimate result of their convictions. They are safe to buy if needed.

Future corn, peas and stringless beans were bought in an orderly fashion. Corn and beans were the most active items. Spinach and herring roe did not attract much attention; they will have their innings in a few days. We will appreciate your order for all, when needed, at the prices quoted herein. Look them up; the prices are attractive.

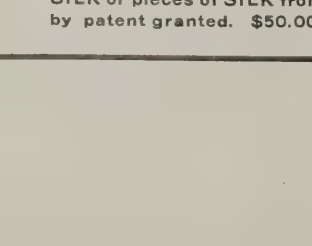
Outside of the usual activity in No. 2 tins, cut-green stringless beans, the orders for the other vegetables were nothing to brag about. Sweet potatoes have joined the ranks of the nearly sold out items, such as beets, spinach and succotash. Buy beans and potatoes if you have not sufficient quantity to see you through. We will appreciate your orders for each.

The demand for fruits was limited to No. 10 apples and No. 3 tins pears.

Cove oysters moved out more freely this week; all sizes. The demand for them came from nearly all sections, and the orders were larger than heretofore this season.

The business in new herring roe was confined chiefly to numerous inquiries. The buyers are wiling to go ahead at fair prices, but the canners say the hazard is too great to sell ahead at this stage of the game. Let us have your inquiries to place before our canners when the season opens up.

We report the market in detail:



Future Tomatoes—Fair buying this week, but there is room for improvement

Standard Quality—No. 1 tins, 55-57½c; No. 2 tins, 85-87½c; No. 3 tins, $1.25-1.27½; No. 10 tins, $4.00; No. 9 tins, 70c, salmon size, 72½c, f. o. b. peninsula.

Extra Standard Quality—No. 1 tins, 60c; No. 2 tins, 90-92½c; No. 2½ tins, $1.30-$1.32½; No. 3 tins, $1.35; No. 10 tins, $4.25, f. o. b. peninsula; possibly Baltimore freight.

USERS of MERRELL-SOULE CORN MIXERS

ATTENTION:

I have a simple little contrivance to attach to the shaft of your Merrell-Soule Corn Mixers and which will completely remove all SILK or pieces of SILK from the corn. You know what that means. No extra power. Once installed always ready. Fully covered by patent granted. $50.00 per set. If interested in better corn, write BOX A 1169 care of THE CANNING TRADE.

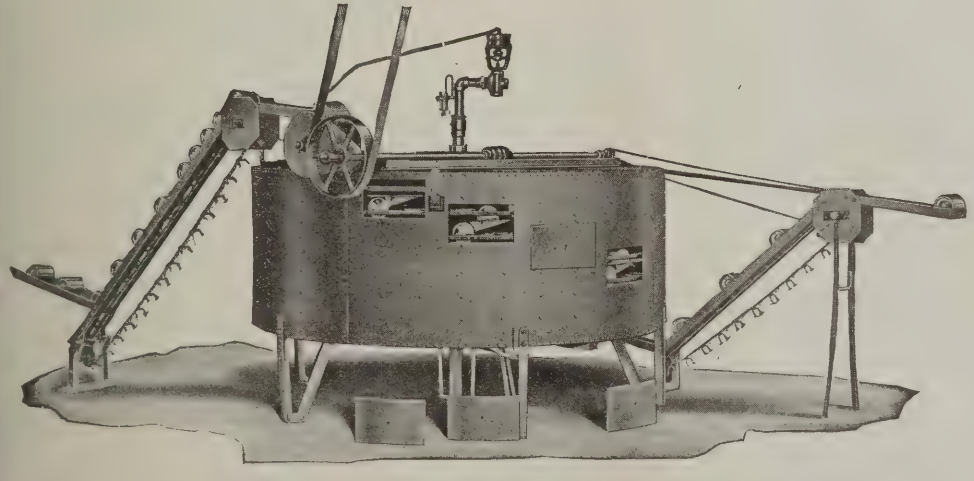
THE MORRAL CORN CUTTING MACHINE

Either Single Or Double Cut

THE MORRAL CORN CUTTING MACHINE is the most durable, simple and efficient cutter you can buy. It has the most positive feed of any cutter in use.

The Morral Cutter will cut large ears, nubbins and pieces of ears, without clogging like other cutters and for this reason you can secure a larger yield of cans per ton with the Morral Cutter than with any other type of cutter.

We furnish special attachments for the Morral Cutter for cutting Golden Bantam Corn and with these attachments the Morral Cutter will cut the Golden Bantam Corn more satisfactorily than any other cutter in use. If you have any cutters that you would like to replace with new and up to date machines let us know what you have and we will make you a liberal allowance for your cutters on the price of new cutters.



We make the MORRAL CORN HUSKER, either single or double and we also make the MORRAL LABELING MACHINE.

Our machines are guaranteed to do satisfactory work, or money back if they fail to do so when set up and operated in accordance with directions furnished.

It will pay you to write at once for prices and further information.

MORRAL BROTHERS, Morral, Ohio

THE SOUDER CONTINUOUS COOKER

The first Cookers built are still running. Patented 1916 with thirty claims granted.

Made durable, out of the best steel. Handles three sizes of cans with nothing to change, Special machine will handle four sizes.

Cans roll gently, continuous while in cooker.

No water to get dirty and soil cans.

Prices and sizes made to suit any canner.

1924 type runs perfect and pleasing. Guaranteed.

SMILE AWHILE

SLIGHTLY LATE

A nervous young gentleman, all a-flutter over the prospect of attending a party in a nearby city, rushed breathlessly into the railroad station at Bangs Center.

"When does the first train leave for Galesburg?" he asked of the white-haired station agent who was perched on a truck in the baggage room.

"Son," replied the agent, "the fust train left for Galesburg in 1861."

TWO THINGS AT THE SAME TIME?

Dorcas—Do you ever allow a man to kiss you when you're out motoring with him?

Philippa—Never! If a man can drive safely while kissing me, he is not giving the kiss the attention it deserves."—Kansas City Star.

WITHOUT MALICE

Sam, impaneled for jury service at a murder trial, had seemed a little too anxious to serve.

"Do you know the accused?" he was asked.

"Yessuh—dat is, nossuh," he replied, realizing that if he made an affimative answer he would be disbarred from serving.

"Have you made up your mind as to his guilt or innocence?"

"Oh, no, suh."

"You think, then ,that you could give his case a fair hearing?"

"Yessuh," replied Sam. "Leastways, ez fair ez de ole scamp deserves."

THE PRESCRIPTION

The Doctor—All you need is a little sun and air.

The Patient—Sir, how dare you!"—Pelican.

THE SPIRIT OF THE GAME

She—Oh, look at them coming with the stretcher! Do you suppose he's seriously injured?

He—I hope not.

"Hope not? But you don't know yet which team he belongs to."

INSULTED

Ruth—That was the most unsatisfactory telephone conversation I ever had.

Beth—Why?

"Some man called up and said, 'Hello, dear!' and when I said, 'Hello,' he said 'Excuse me!'"

Kay—A college education teaches you so many things. You couldn't begin to mention them all.

Det—No, not in polite society.—The Pointer.

SORROW'S CROWN OF SORROW

Many kissed me when I yet
Was too small to value kisses;
Now, grown knowinger, I get
Nary taste of such-like blisses.
Let them bar me from the feast
And an obsolescent list me:
Once upon a time, at least,
Many kissed me! —Edward W. Barnard.

EXCHANGES

"Pardon me, but I think we have some common ancestors," began the young man in the bright green cap.

"No doubt you have," replied Miss Cutting, as she turned her back.—Dodo.

EDITORIALS

THE OLD TIN CAN

They've written songs and poetry
On topics far and wide;
On babbling brooks and shady nooks
And love, and suicide;
But neither Burns nor Shakespeare,
Nor any other man
Has ever paid a tribute
To the old tin can.

The old tin can—we know it well,
We meet it every day;
It enters every household
In its unassuming way;
And even when its contents
Have filled the wants of man,
We still have many uses
For the old tin can.

No word in any land or clime
A greater meaning brings;
We can not only foods alone,
But many other things;
We can an actor if he's punk,
And baseball players, too;
A speaker, if he talks too much;
The grouch, who's always blue.

We can heat, light and music,
We can things everywhere;
We even can by radio
The noises in the air.
One day a guy put wheels on one
And saw how well it ran,
And now we go joy-riding
In an old tin can.

So let's give praise where praise is due
And in the future scan
A real poetic tribute to
The old tin can.

—*Irvin Engler.*

THE APRIL CONVENTION—This annual Convention of the Eastern Canners Association is rapidly growing into a husky boy, and the meeting this year—April 22nd to 26th—promises to be even more husky than any of its predecessors. As usual, it will be held at the canners' headquarters, the Hotel Sherman, and the program looks like it would be all business.

At the same time there will be meetings of most of the N. C. A. Sections, together with a meeting of the National Kraut Packers Association, so that the event will take on the appearance and importance of a National Convention. It means another week's convention; the matters which will be discussed and acted upon are of equal importance, and, therefore, the importance of canners being present measures up well with that of the annual gathering of the whole body in January. The one thing that will be lacking to make the week resemble, in every detail, the big gathering, will be the absence of the big machinery display. That, of course, is a very decided difference, but the machinery and supply men will be there in person and ready to take care of any business which the canners have yet unplaced. So now we have the winter convention and the spring convention, and you will do well to mark prominently on your memo pad that you must be among those present this spring.

And, to reiterate what Secretary of the Western Canners Association, Col. J. A. Lee, so forcefully urges, don't forget to ask for a railroad certificate receipt for your ticket, even if the saving does not mean anything to you, so as to help the other fellow.

As this will be an Eastern convention, what a crowd would be there if we could move the Atlantic City Boardwalk, with its Easter parade and week of festivities, to the Hotel Sherman, or the Hotel Sherman to the Boardwalk! But Secretary Lee says that Chicago is the greatest summer resort in the world, and we all know it is nice in late April.

WHY DELAY—Quite a number of the machinery and of the supply men have expressed to us a mental puzzle as to why many of the canners have not placed their orders for machinery and for supplies, which they will need, and which, beyond a doubt, they intend to buy before the next season. The year has grown old enough for every canner to have gone carefully over his machinery, note what must be renewed or replaced and to determine whether or not he will install the improved machine about which he has been thinking. They should not wait longer in these matters. There is nothing to be gained in price by the delay; on the contrary the machinery man may

have to charge more because he will have to work overtime to take care of the buyer. The order might very easily be placed now, and time of delivery specified, which will make definite the time when the money must be provided. This will enable the manufacturer to plan your requirement ahead and have it ready on time, and certainly he should be given this consideration. Take the matter of these big Automatic continuous Cookers. The Anderson-Barngrover machine, which has been so well and painstakingly drawn to your attention by attractive advertisements during the past few months—a machine which most canners realize can immensely simplify their operations, and help put the goods through the factory with greater ease and in better condition—yet that machine is made on the Pacific Coast and cannot be delivered by parcels post, special delivery, much less by wire.

Or again, canners who have contracted their acreage and intend to put up an increase pack this coming season seem to have given only attention to their seed supply. What about the cans and cases, the labels and the hundred and one minor things which will play havoc in the excitement if the opening days of the pack if they are not ready on hand? Why not give these matters attention now while you have the time. It will be to your advantage as well as to the advantage of the man upon whom you depend for these supplies. You have had rest enough since the turmoil of the last season's pack. Now stand up and stretch; rub your eyes, look about and get busy with your order book. The new season will be here before you realize it.

PENNY WISE AND POUND FOOLISH.—Is an old English expression that proves true today as it always had, and sometimes it would seem or at least they are charged so that the canners furnish more evidence of this than some other industry. For instance, rather than go to the small expense of having their thermometers carefully tested before the season opens, they will go along with the old thermometers and lose more goods by swells and flat sours, than would have paid for a dozen sets of new apparatus. Examples might be multiplied of this effort to save the drippings at the spigot while the bung-hole is wide open.

This has been forcibly brought to our attention, recently, in connection with the revision of that widely known, and extensively used book, "A Complete Course In Canning." Most canners keep a copy of this book in their offices, as a sort of insurance, in case any question might arise as to the process or the time. When the goods are piling in and the factory rushed, any hesitation or doubt then can quickly run into hundreds of dollars of loss and result in the disorganization of the pack. Five minutes too much or five minutes too little in the process can play havoc, as you know. Therefore, they keep this important book at hand, and a moment's consultation sets the mstraight, dispels the doubt, and lets them proceed with certainty.

All the industry knows that there have recently come about troubles in processing, and in the keeping of the goods, which they never had to face before—botulinus, flat sours, black in corn and peas and other products; troubles of the kind that try souls, as well as the pocketbooks, of many canners. They have been forced to change their methods and particularly the times of process, and yet they feel timid and frightened even now.

To meet this condition we have had this book, A Complete Course In Canning, completely revised by one whom we do not hesitate to name as the highest authority on the subject obtainable. We feel confident in offering this newly revised edition with the assurance that the users will find in it the answers to their problems. Now, everyone knows that the costs of production have immensely increased and that if we attempted to put the book out on the same basis as previous editions we would have to do charity work for the industry; and yet despite this fact, and the added importance of the contents of the book to say nothing of the vital importance of having the correct process times for every article there are those that seem to think that $10 for the new edition is high. There is only one way to weigh this $10, and that is against your possible spoilage. How long would it take to lose $10 in goods, and in quality of them, if you happened not to be sure of the time? Why that proper time and direction would be easily worth thousands of dollars to every canner. There is not a canner in the business, handling any product put in cans, that can afford to be without a copy of this new book. A strong statement but think it over.

A SAUERKRAUT WEEK?

Well, here's what Secretary Roy Irons says about sauerkraut in his most recent epistle to the "onregenerate":

Clyde, Ohio, March 31, 1924.

The following is a reproduction of a letter from a retail grocer who had mailed out 154 of our booklets to his customers:

Missouri, February 27th, 1924.

National Kraut Packers' Association,
Clyde, Ohio.

Dear Sirs: The evidence of good results from the mailing list campaign is best shown by actual figures of new customers for sauerkraut, and we are giving a list of fifteen customers who purchased kraut the first day after receiving the booklet, and who had never purchased kraut from us before, although they do their regular buying at our store. (Names.)

We also sold more kraut to the regular kraut buyers than ever before. Thanking you for your excellent co-operation, we beg to remain, Yours very truly,

C. CASH STORE.

This is proof of just what detail work will do, for we are shown that the mailing of 150 booklets brought in 15 NEW buyers, and also increased the sales to the old buyers.

It would be fine if we could find some effective way to reach the majority of the retailers and get them to work with us even for a week or so a year, say, for instance, work out a "Sauerkraut Week" in addition to our national advertising. What do you think?

WOLFROM NOW AT SHERMAN

JOHN L. Wolfrom, who has been connected with the Niagara County Preserving Corporation at Wilson, N. Y. for some time will operate the Sherman Preserving Co. plant at Sherman, N. Y. this year. Sufficient pea and Golden Bantam corn acreage has already been secured to operate to capacity. Peas will be purchased on the graded basis according to size.

BENNETT & HUGHES MOVE.

The well-known brokerage house of Bennett & Hughes, Buffalo, N. Y., is moving from its former office, 202 Main street, to 1017 Bramson Building. They made this move this week, and friends and customers should take note of the change.

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER:

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 Quality.

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water–front enable us to give the Service required.

Our connection with closing machine manufacturers enables us to furnish the latest, speediest and best closing machine Equipment.

Can you see any reason for not letting us take care of your requirements in the manner you desire?

More Tomatoes From Fewer Acres

By W. R. Ballard and A. D. Radebaugh,
University of Maryland Extension Service.

A resume of the work done on tomatoes in 1923

INTRODUCTION—Thirty-five beds in thirteen counties of the State, producing a total of seven and a half million plants, afforded ample opportunity during 1923 to test the particability of the centralized tomato plant bed and its adaptability to varying conditions in Maryland.

Its operation in Cecil County, where it originated as a definite project the previous year, clearly indicated its possibilities. To growers in that county it demonstrated very effectively two important factors in the production of cannery tomatoes. It showed them that strong, vigorous plants set in the field at the proper time have a marked influence in increasing the acre yields of tomatoes and thereby effecting corresponding reductions in the cost of production. Furthermore it demonstrated that such plants could be grown in a way to meet the practical requirements of growers, relieving them of the task of planting their own beds and at the same time supplying them with plants of better quality.

The experience of the past year, based on results of many beds in many counties, confirms this evidence and indicates that the centralized plant bed may be regarded as an important forward step in the improved production of tomatoes in Maryland.

Several facts stand out with prominence from the experience of the past year. Among them may be mentioned the fact that had it not been for the centralized plant beds many growers in the State would have found themselves unable to secure suitable plants to meet their acreage requirements.

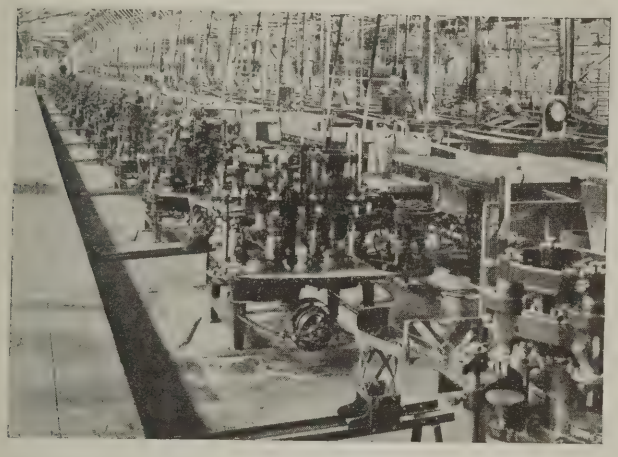
It is also important to observe that the average yield of cannery tomatoes in the State for the year was five and a half tons per acre, a figure considerably higher than in former years. How much of this increase in yield can be attributed to centralized plant beds it is impossible to estimate, but that the exerted considerable influence is unquestioned.

Efforts in connection with the plant beds likewise had their effects with individual growers, many of whom followed the directions advocated for plant bed management with the result that they, too, secured plants of better quality than formerly. The selection and saving of home grown seed was another result of the season's work.

Both grower and canners were pleased with results obtained during the year and there is every reason to believe that the centralized plant will become a permanent factor in the development of the tomato industry in the State.

In the following pages of this Bulletin, a summarized account of the conditions affecting the centralized plant beds during the year and the results obtained are given. Directions for establishing the plant beds, based upon the original recommendations and the experiences of the past year, are included for those who contemplate plant production.

The Campaign.—The community plant bed project in Cecil County during 1922 was so successful that its influence spread to all the tomato growing sections of Maryland as well as to adjoining states. This interest was further stimulated by the issuance of the bulletin "More Tomatoes From Fewer Acres" and by an intensive publicity campaign in the tomato growing counties. Enthusiastic meetings of both canners and growers were addressed by specialists from the Extension Service. Lantern slides were used to illustrate the method of handling the community plant bed. The County Agents followed up this preliminary campaign by organizing community plant beds in sections where the plant seemed feasible.



The Plant Beds.—A total of thirty-five beds were established in the State distributed over thirteen counties. These beds varied in size from one-eighth acre to one and one-half acres. Canners co-operated in the establishment of twenty-eight of these beds by donating seeds, fertilizer, tools and other supplies and equipment. Besides these community beds a very large number of individual growers were induced to follow more or less closely the recommendations laid down for the community plant beds. This was notably true in regard to spraying.

Unfavorable Conditions.—After getting off to an auspicious start unfavorable weather conditions handicapped the project very materially. In some cases heavy rains came just after seeding, which packed the surface before the mulch was placed over the top of the rows. Some of the growers broke up the crust with various tools to allow the plants to get through. Even under the best soil conditions the late spring and the cold drying winds made it difficult to secure good growing conditions. A number of skillful plant growers stated that in all their experience they had never known a season quite so unfavorable for the production of tomato plants. Under the circumstances it was fortunate that the interest in plant production had been so aroused in Maryland that special care was taken not only of the community beds but of the individual beds as well.

Control Of Insects.—The flea beetle and the potato beetle were unusually abundant the past season. This fact together with the unsuitable growing conditions made it all the more important to follow out a careful spraying program. In a few of the community plant beds, spraying was not begun as soon as it should have been. As a consequence considerable damage was done to the plants by insects. In some cases it was necessary to increase the amount of arsenate of lead from one and one-half to two and even three pounds to fifty gallons of Bordeaux in order to secure good control. In the Cecil County bed, dusting with a commercial mixture was tried and was found to be cheaper, more easily performed and just as effective as spraying.

Results Secured.—About two-thirds of the plant beds were successful, a few others produced some plants and a small number were complete failures. Approx-

imately 7,500,000 plants were produced in the centralized plant beds. The quality of the plants was above the ordinary.

Field Results.—It has been impossible to secure many accurate field records of yield, but individual cases have shown excellent results. In Dorchester County one demonstration field in which both community bed plants and ordinary plants had been set, yielded respectively twelve and four tons per acre. In Cecil County five demonstration fields of twenty acres each set with plants from the community bed averaged seven and one-half tons per acre. In Kent County the yield was from two to four tons per acre more than from ordinary plants. The plants in the individual beds had been taken care of so much better than in previous years, that it was not to be expected that very striking differences in yield would show up. The fact that the average yield for the State in 1923 was five and one-half tons per acre indicates that the tomato crop had been given more careful attention than ever before.

Seed Saving.—One of the most important results of the campaign was the interest which developed in the selection and saving of seed stock. In Harford County sufficient seed from selected plants was saved to plant seventy-five per cent of the county acreage for 1924. In Cecil County a variety test of several strains of Greater Baltimore was conducted and a number of individual plant selections were made. Considerable quantities of seed of improved strains were saved and this stock will be distributed to growers who will agree to harvest the entire crop for seed. In Dorchester County an effort is being made to increase stock of wilt resistant strains. In several other counties considerable quantities of seed have been saved for future plantings.

Inspection Trips.—Several inspection trips through the important tomato growing sections were made by Extension Service officials and others. A number of canners and growers also visited centralized plant beds and demonstration fields. A special study of the mosaic disease and the relation of the community plant beds to its distribution to the fields was made by Dr. J. B. S. Norton of the Experiment Station. This disease was found to be widespread in the tomato growing sections. It is estimated that the average loss from this disease is about five per cent, although in individual fields the loss ran as high as ten per cent.

THE PLANT BED

Management.—Various ways of establishing community plant beds have been in use. In some cases the canners donate the seed, fertilizers, tools, etc., the growers agreeing to take so many plants at cost. A good plant grower is put in charge of growing the plants and is paid by the hour. Another plan is to have some individual grow the plants at a specified price per thousand, the farmers of the community agreeing to purchase a definite number of plants. From the experience of the past year it is the consensus of opinion that the best plan of management is to have the plant grower assume all responsibility for the growing of the plants, to purchase all supplies and to sell the plants at a price which will insure him a reasonable profit. In short, it is believed that someone in each tomato growing community should develop a commercial plant growing business.

Soil Preparation.—As a rule plant beds from one-fourth to one-half acre in extent are large enough. Beds of this size should produce from 250,000 to 500,000 plants. Select a fertile, well-drained soil, a sandy loam being preferred. A sod plowed in the fall should make an excellent bed. If fall plowed land is not available, plow the ground as early in the spring as possible. Fertilizing practices will vary, but good results have been secured where a top dressing of well rotted manure and from a thousand to twelve hundred pounds per acre of a 2-8-5 fertilizer applied broadcast and thoroughly mixed with the soil. Where manure is not used, good results should be obtained by broadcasting from one to two thousand pounds of a 4-8-7 fertilizer per acre. The surface must be put in fine condition. Remove all trash, stones or clods by hand raking.

Seed—The importance of good seed cannot be overemphasized. Home selected seed or that obtained from reliable seedsmen usually gives best results. Where soils are infected with Fusarium wilt, seed from only wilt resistant strains should be sown.

Greater Baltimore is the most popular variety planted in Maryland for canning purposes. Stone, Clark's Special and Delaware Beauty are also extensively grown. In certain sections midseason varieties, such as Bonny Best, Chalk's Jewel and John Baer, are grown. The first pickings from these varieties are shipped to the markets, but the bulk of the crop to the cannery.

The amount of seed to be purchased is dependent upon several factors. The size of the seed varies considerably, that from fruits of the crown set usually averaging larger than that from later pickings. However, where germinating power is high, one ounce should produce enough plants to set one acre in the field.

Planting The Seed.—For most of the tomato growing sections the middle of April is the time to plant in the open seed bed. A hand drill of the revolving barrel type is the best tool for sowing tomato seed. This keeps the seed stirred and prevents clogging. Make the rows from twelve to fourteen inches apart. Regulate the drill to drop five or six seed to the inch and cover not more than one-half inch deep.

The Surface Mulch.—A mulch placed on top of the row immediately after seeding has proved one of the most important factors in securing a stand. This prevents the formation of a crust which would keep the plants from getting through the ground. The best mulch tried is a mixture of approximately equal parts of leaf mold and tankage. Five hundred pounds of each would not be too much for a half-acre bed. Well rotted manure has also given good results, but sawdust has not proved satisfactory.

Cultivation.—Begin cultivation as soon as the plants appear above ground. The most efficient tool for this purpose is the hand cultivator. Five cultivations will usually be necessary. Thorough cultivation keeps down the weeds, aerates and warms up the soil and stimulates a good growth of the plants. Pull weeds from the row by hand.

Control Of Insects And Diseases—Thorough spraying or dusting of plants in the seed beds is an essential factor in the successful production of the best type of plant. The flea beetle may be expected to appear even before plants come up. In some sections potato

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

beetles do serious damage. The grower must be ready to cambat these pests as soon as they appear. Spraying with Bordeaux 4-4-50 to which has been added from 2 to 3 pounds of Arsenate of Lead or dusting with a proven commercial mixture, should be started as soon as the plants come through the ground.

Where aphids are present it is advisable to add nicotine sulphate to the mixtures.

Four or five applications may be necessary before plants go to the field.

As a precaution against the mosaic disease in the plant bed, destroy all wild horse nettles, or ground cherries in the vicinity of the bed. The aphids are apparently more responsible for spreading this disease than other common insects.

Protection from Frost—One of the greatest sources of worry on the part of those in charge of community plant beds is the threat of frost conditions. In order to minimize this danger locate the seed in a protected place or provide some sort of a windbreak. Usually more damages is done by the cold, drying winds than by the low temperature. Often fires built on the windward side are sufficient to bring the plants through without serious loss. It is rarely necessary to provide fire protection more than two or three nights during the season, and then for only a few hours at a time.

THE FIELD.

Preparation Of Land.—Thorough preparation of the soil is necessary for the best results with tomatoes. Plow the ground early and have it worked down into a fine mellow condition by the time the plants are to be set.

Soil Fertility.—Heavy yields of tomatoes cannot be secured unless the soil is fertile. Tomatoes respond well where stable manure is used. When manure is scarce and high, results may be secured by using from 800 to 1,200 pounds per acre of a high grade fertilizer. Probably seven or eight tons of manure with 600 to 800 pounds of fertilizer per acre would be the ideal pratice. On the lighter soils increasing the potash in the fertilizer mixture improves both the quality and the yield. The usual method of applying fertilizer is to broadcast half of the amount and apply the remainder in the row.

Crop Rotation.—One of the most important measures for the control of both insects and diseases effecting tomatoes is to follow a rather long rotation. It is believed that much of the loss from wilt could be avoided if tomatoes were not planted in the same field oftener than once in five or six years. Potatoes, peppers and egg plants are subject to attack by many of the same insects and diseases as are tomatoes. Therefore do not have these crops follow each other in the rotation. Furthermore it is better to grow these crops at some distance from each other.

Setting Plants.—For the best results set stocky, well grown plants in the field as soon as possible after danger from frost is past. In most sections this will be about the middle of May. Plants are set both by hand and by machines. When the soil is in good condition the planting machines will do a better job than can be done by hand. In any event the earth should be packed firmly about the roots. Plants are usually set 4x4 feet apart. Some growers prefer to set the plants three feet apart in rows six feet apart.

Cultivation.—The number of times fields should be cultivated will vary according to conditions. Frequent shallow cultivations should be the rule. Do not continue cultivation to the point where the vines are injured or the green fruits knocked off.

Harvesting The Fruit.—Use care in picking the fruit. Pick as soon as possible after the fruit is ripened, so that the development of the green fruits will not be checked. Caution the pickers against trampling on the vines or knocking the green fruit off.

Saving Seed.—The best practice in saving seed is to go over the fields just as the fruit is beginning to ripen and stake individual plants which have a heavy set of the type desired. Save at least all the fruits of the crown set. Place these fruits in a barrel, crush and add a little water. Allow the mass to stand three or four days to ferment, stirring occasionally. The seed will settle to the bottom and the pulp may then be poured off. Wash the seed carefully, then spread out to dry in a shady, well ventilated place. Dry the seed quickly to prevent germination. If artificial heat is used do not allow the temperature to get high enough to injure the vitality of the seed. As soon as the seed is dry, bag it up and store where it will be protected from mice.

MARYLAND LAW

An Act to Regulate the Sale of Vegetables and Fruit Seed for Planting Purposes.

Section 1. Be it enacted by the General Assembly of Maryland, It shall not be lawful for any corporation, copartnership or individual, engaged in the canning of preserving of any fruit or vegetables, to sell or otherwise dispose of the seed of any fruit or vegetables obtained in the canning or preserving of any fruit or vegetables to any dealer in garden seed or other person under circumstances where the same may be resold for the purpose of planting or propagation, unless said corporation, copartnership or individual shall sell said seed under an absolute guarantee as to purity and germinating properties.

Section 2. It shall not be lawful for any corporation, copartnership or individual to sell or otherwise dispose of any such seed for planting purposes.

Section 2a. The provisions of this Act shall not be interpreted as preventing the use or preservation of any edible materials produced in connection with a crop grown for legitimate seed purposes.

Section 3. Whoever shall violate the provisions of this Act shall be liable, upon conviction, to a fine of not less than fifty nor more than one hundred dollars for the first offense and to a fine of not less than one hundred nor more than five hundred dollars for each subsequent offense.

Section 4. This Act shall take effect and be in force from and after the first day of June, 1918.

Approved April 10th, 1918.

HIS LIBERALITY

"You remember when Bigge Gunne assisted us in that Japanese benefit?"

"Yes, indeed."

"Well, I sent him a check and he returned it, saying he couldn't think of accepting it."

"How generous!"

"Wait a minute. Along with the check he inclosed a self-addressed, stamped envelope marked: "To return the check to me in case you insist on its acceptance.'"

THE EUROPEAN CORN BORER IN NEW YORK

By P. J. CHAPMAN, Ast. Extension Entomologist, New York College of Agriculture, Cornell University.

Given before New York State School for Cannery Fieldmen.

THE European corn borer is an insect which has had wide publicity. This pest has become firmly established in Northeastern United States and in Ontario Province, Canada. It probably gained entrance in 1909 or 1910 in broom corn imported from Hungary and Italy. In 1917 the European corn borer was first reported and identified when it was found causing severe damage to sweet corn in the vicinity of Boston, Mass. This infestation now has increased, so that it includes about 140 towns in Eastern Massachusetts and 12 in Southeastern New Hampshire. In January, 1919, the insect was discovered in the vicinity of Scotia, N. Y. Around this village as the approximate center, an area comprising about 2,200 square miles is infested. Later in 1919 another area was discovered in Western New York. Today we find this area a part of a sparse infestation occurring as a strip about 50 miles wide bordering Lake Erie and land immediately adjacent. The borer has also been found in a limited area near Gravesend Bay, Long Island, New York. It is located in a refuse dump area, where, while slight, it will be hard to eliminate, and will offer possibilities of spread into the sweet corn districts on Long Island and New Jersey.

Very serious injury was apparent in the infested areas around Boston, Mass., and St. Thomas, Ontario. It was estimated that from 70 to 90 per cent of the corn stalks were infested in large fields of field corn around St. Thomas, causing a total commercial loss of 20 to 5 per cent. It is reported that growers of sweet corn in the vicinity of Boston were in a large part forced to discontinue growing this product because of this pest. Curiously enough, while the corn borer has been able to spread rather rapidly in New York State, the amount of damage caused in the present infested eara has been relatively slight. Because the European corn borer has not caused great damage in the present areas of infestation in New York State does not in any way mean that other districts in the state, or out of it, will experience the same lack of injury. It is still a pest of destructive possibility and can bear close watching.

A quarantine is in effect on the infested areas and is being strictly enforced. Every care is being taken by the officials to stop the further spread of this pest from these areas in the United States, and to stop further importation from Europe.

The corn plant seems to be preferred by this borer, especially sweet corn. Serious injury, however, is also found on field corn, broom corn and popcorn. There has been reported injury from this pest on a wide range of hosts, including beans, beets, celery, peppers, potatoes, rhubarb, several flowers, cereals, weeds, etc.

GOLD SEAL TIN PASTE

Reg. U. S Pat. Off.

For Spot Labeling

Gold Seal Tin Paste sticks your labels so that they *cannot be pulled off.* It never gets brittle nor allows the labels to loosen up on the dealer's shelf.

It comes ready for use without mixing, shipped in 5 gal. cans, 30 gal. and 50 gal. barrels.

Peas	Okra	Cabbage	Cucumber
Corn	Tomato	Spinach	Snap Beans
Beet	Squash	Pumpkin	Cauliflower

Dwarf Lima Beans

Or any other varieties you may want.

FUTURE OR 1924 CROP SEED

When ready to place your Contract order for delivery after 1924 crop is harvested, write us for prices.

If we had not grown good seeds, given fair prices and careful attention to business, we would not be the oldest Seed House in America, as this is our 139th year in the business.

D. LANDRETH SEED COMPANY

BRISTOL, PA.

Business Established 1784
140 years in the Seed Business.

The European corn borer attacks all parts of the plant except the fibrous roots. The young borers work in the developing tassels, the older ones tunneling the base and causing a characteristic lopping. The bleeding holes and wet borings on corn stalks and ears in midsummer are also signs of the pest. Borings up and down the stalk, through the center of the corn cob and the destruction of the grain are commonly noted signs of borer activity. As many as 15 full-grown borers, each an inch long, have been found feeding within a single ear of corn.

The insect passes the winter as a full-grown larvae within the tunnel made in the host plant. At this time it is about one inch in length, varying from brown to pink in color. In May they resume activities, form cocoons, transform to pupae, and in about 19 days the adult moths emerge. The moths are quite strong fliers, having been reported as flying from 5 to 20 miles. The female moth lays her whitish flat eggs in little patches on the leaves. An average of about 450 eggs are laid by each female. These eggs hatch in about a week. The young larvae feed at first on the surface of the leaf, and then make their characteristic borings through the stalk and ear. The borers work for the most part in July, August and September. There are two full generations in the New England area, and probably one full and a partial second in the New York regions.

There are several practices which are recommended to the individual grower in European corn borer control. (1) Co-operate with the Federal and State officials in the maintenance of an efficient quarantine; it is to the interest of all concerned. (2) Growers inside infested areas should learn of the numerous host plants of this pest, and be extremely careful in the transportation of such material into new areas. (3) Burn or otherwise destroy before May 1st of each year all cornstalks, corncobs, corn stubble, etc., so that the over-wintering larvae may be killed. (4) Keep cultivated fields, fence rows, roadsides, etc., free from large weeds and large-stemmed grasses. (5) Cut corn close to the ground. (6) Cut and remove sweet corn fodder from the field as soon as harvested. Feed direct to livestock, place in silo or destroy by burning. (7) Cut and remove field corn as soon as the ears are mature. Feed the stalks to livestock as soon as possible or burn. Shred or cut the fodder to increase the consumption. (8) In growing corn for ensilage be sure that the whole stand goes into the silo or destroy the remaining stalks. (9) Where possible plow under in the fall all infested cornstalks, corn stubble, etc.

Note.—A recent bulletin has been put out by the U. S. Department of Agriculture dealing in detail with the European Corn Borer and its Control. This bulletin is Farmers' Bulletin No. 1294; a copy may be secured by persons interested by writing to the Department of Agriculture, Washington, D. C.

WESTERN CANNERS' ASSOCIATION REVIEW

Written by John A. Lee, Secretary

Chicago, Ill., March 20, 1924.

THE Fortieth Annual Convention of the Western Canners' Association will be held at the Hotel Sherman, Chicago, April 22, 23, 24 (Tuesday, Wednesday and Thursday), 1924. The first session of the regular convention will be held Tuesday afternoon, April 22, at 2 o'clock, in the Crystal Room of the Hotel Sherman. An application has been filed with the railroad associations for a special rate of one fare coming and half fare returning, for the entire week of April 21, 22, 23, 24, 25, 26 (Monday to Saturday, inclusive). The National Canners' Association will hold meetings of several of their Sections conjointly and co-operatively with the Western Canners' Association, and the Illinois Canners' Association will hold a conjoint meeting during the week, and Committee Meetings, National Corn Section, Tomato Section, Pea Section and, possibly, Fruit Section meetings will be held during the week, and the week will probably be one of the most important business meetings for canners ever held. A very large attendance is anticipated.

In order to secure the benefit of the half-fare returning, it will be necessary to obtain a certificate of purchase from the agent when buying a ticket to Chicago, which certificate will be validated by the Secretary of the Western Canners' Association at the convention. Then the same railroad or route will sell a ticket to the starting point for a half-fare. The return must be by the same route one comes to Chicago.

It is necessary to have 250 certificates for validation before the validating officer of the railroad association will sign the certificates, and his signature is indispensable. Therefore, everyone coming to the convention by rail, no matter where from, must obtain a certificate from the railroad agent at starting point in order to help make up the total number.

At our last convention only 196 certificates were presented, and all were deprived of the half-fare home, there not being the requisite 250. There were about five hundred at that convention who came by rail, most of them forgetting to get a certificate of purchase when buying their tickets. Some of our members come from long distances, and the loss of the half-fare sometimes amounts to thirty or forty dollars. No matter how short a distance you come from, or whether you intend to return by the same route or not, you may change your plans; you will by presenting a certificate or purchase of a ticket help others to get a half-fare returning. Please be loyal and considerate in this matter. Help others by co-operating.

The final agreement in relation to the disposition and redemption of swells in canned foods will probably be made at this convention, as there will be conferences in relation to the completion of the operative details.

All the chief officers of the National Canners' Association will be present at the convention of the Western Canners' Association at Chicago, and there will be meetings of the Tomato Section, the Corn Section, the Pea Section and, probably, one of the Fruit Section of the National Canners' Association. There will be able scientific and practical men, students of the problems of canning, present to report as to their investigations and discoveries. You cannot afford to miss this meeting.

This will be the annual meeting, and there will be an election of officers for the ensuing year. J. W. Hill, of Iowa, has made a fine president for the past year, and it is hoped that he can be induced to take the office again. He is a man of fine judgment, an accomplished presiding officer, and altogether a high-grade man. He has many business responsibilities and connections, and may feel that he cannot accept a re-election, but it would be of important disadvantage to the association not to retain him. He should be re-elected and induced to accept.

All chairmen of standing committees of the Western Canners' Association will be expected to make reports, and should at once confer with the members of their committees by mail so as to have a program for a committee meeting at the convention and be in a position to present something practical and useful to the convention.

This Review is edited by the Secretary of the association without conference or consultation with anyone, and the opinions expressed are his personal views. They are, however, not to be considered official.

If you have not remitted your dues for 1924, please do so at once, so they can be reported to the convention in April as paid. A bill was sent you on January 1st, and though the average of payments have been fairly good, still there are quite an important number who have not remitted. Look it up! Payment of dues carries from January to January.

We mailed you recently a copy of our constitution and by-laws, revised up to date, with a list of members, active and associate, printed in the back of it. If you want a good, reliable broker, look among our list of broker associate members and select one. If you want to buy machinery or supplies, you will find a list of dealers and manufacturers among our associate members.

The situation of the canning industry and its outlook for stability and prosperity was never stronger than at present. Not

COMPOUND APPLYING MACHINE DOUBLE SPINDLE

Being adjustable for all sizes from 2 to 6 inches in diameter, this double machine supplies sufficient compound for any high speed sanitary can making line. Ends are stacked in hopper and are fed, coated and discharged without handling.

Feeding nozzles are self-clearing, and arranged to apply compound only when ends are in proper position. The machine has independent supply to each nozzle from separate agitated reservoirs, insuring proper distribution of compound, also separate control levers for each slide so that one side can be operated independent of the other. Direct connected pressure pump and attachments for one size are standard equipment.

We also manufacture a Disc Dryer to be operated with Coating Machine, which has sufficient capacity to dry compound for all sizes.

McDONALD MACHINE CO.

Mfrs. of Automatic Presses, Can Making Machinery, Dies, etc.

7600 South Racine Avenue Chicago, Illinois.

only are the products of the 1923 pack closely sold up in peas, corn, tomatoes, fruits and fish, but futures of the crop of 1924 have been contracted heavier and more generally than for any year since 1918. The canning of quality goods has had a very important influence in stabilizing the demand, and the prices for canned foods and canners are to be congratulated for good and conscientious work in that respect. Not only has this policy created a reliable demand for canned foods at fair prices, but it has established a credit for canners which they needed, and which places them in an independent attitude toward the market.

We are frequently in receipt of letters from our broker-members who need good cannery accounts. If there is any place where you have no broker and want one, write this office, and we will give you the address of a reliable party.

The newly-elected president of the Canning Machinery and Supplies Association, E. E. Finch, of Cincinnati, is a live wire and a good speaker. He will be present at the convention, always has something worth while to say, and he says it well and entertainingly.

Charles P. Whiteman, of Oklahoma City, president of the National Food Brokers' Association, was re-elected at the recent convention, and well deserved that honor. He has made a fine record as president of his association, and is an interesting speaker, always having something of practical value to present. Come and hear him.

The Western Canners' Association has again been honored by having one of its ex-presidents elected president of the National Canners' Association, Royal F. Clark, of Beaver Dam, Wis. In addition to being an extensive pea canner, he is an able lawyer, with a large practice. He is a snappy and forceful speaker, and will be listened to with great interest at this convention. Frank Shook, assistant secretary of the National Canners' Association, will be at the convention, and will present a report of the results of Canned Foods Week, 1924. He has had charge of the details of the work at Washington for several years, and his report, with information from all parts of the United States, will be absorbingly interesting.

This will be the fortieth session of the Western Canners' Association, and its duration for that many years is proof that its work is educational and of practical value to its members. It holds two conventions each year—in April and November—and they are always well attended. Its sessions are always full of practical business, of value to those who attend.

Brokers and supply men who attend our convention and who owe loyalty to our association should avoid obstructing the work of the convention by holding canners or themselves out of the regular meetings. By doing so the officers are greatly embarrassed in starting the meetings or sessions on time. Every member should consider it his duty to attend the sessions and not to induce others to be late, or to fail to attend. There will be plenty of time for business between sessions, or in the evenings, or before meetings are called in the morning.

Note the list of members of the Canning Machinery and Supplies Association, who are members of the Western Canners' Association, in the back pages of the copy of the Constitution we mailed you some time ago. That association and its members have always been loyal friends to the Western Canners' Association and are entitled to confidence and support in their business.

We are frequently asked what trade papers are valuable to canners and brokers, and present a classified list below of those best known. There are many others, of course, but we have not space to mention all, as there are several hundred published in the United States:

Canning Papers

The Canner, 140 N. Dearborn, Chicago, Ill.

The Wholesale Grocer, 190 N. State St., Chicago, Ill.
The Retailers' Journal, 190 N. State St., Chicago, Ill.
The Grocery World, Philadelphia, Pa.
Facts and Figures, Consolidated Bldg., Jacksonville, Fla.
National Retailers' Bulletin, R. A. Long Building, Kansas City, Mo.

The weather is usually pleasant in Chicago in April, and as the date in April is close to the first of May, good weather can be confidently expected. An automobile ride through the parks and beautiful parts of Chicago will be arranged for the visiting ladies, and, possibly, a theatre party.

The wholesale grocers' associations will be represented at the convention, their officers having been invited to be present and to address the convention, and the officers of the National Association of Retail Grocers of the United States have also been invited to attend and address the convention.

An illuminated map showing the points where addresses were delivered to Rotary and other clubs during Canned Foods Week will be exhibited, and it will also be used to show the points where the best work for Canned Foods Week was done by distributors. The map will be furnished by the American Can Company.

The movement to address Rotary clubs during Canned Foods Week was initiated by Mr. S. G. Gorsline, of the Anderson-Barngrover Manufacturing Co. He is a loyal worker for the cause of canning, and the movement from his initiative spread until invitations from Rotary Clubs, Kiwanis Clubs, Lions Clubs, University Clubs, Chambers of Commerce, Housewives' Leagues, Domestic Economy Clubs, Retail Grocers' Associations, Optimists' Clubs, and other organizations were received from all parts of the United States, and speakers were supplied in response to the invitations. Many of the addresses in relation to canned foods were broadcasted by radio. This was fine and effective work, for the fashions in foods are set by the people of education, and good taste, and their example and leadership is followed by consumers generally.

WHAT THE BROKERS SAY

Indianapolis, Ind., March 22, 1924.

Acreage as yet is coming slowly for a number of the Indiana canners. The large majority of canners of the State are sold up on futures to the entirety of the acreage they expect to contract. It is only an occasional packer that will take straight standard business.

Prevailing prices are:

	Standards	Extra Standards	Fancy
No. 2s.....	$1.00	$1.10	$1.30
No. 2½s.....	1.35	1.40	1.65
No. 3s.....	1.40	1.50	1.75
No. 10s.....	4.75	5.00	5.50

There are one or two packers that will still consider a limited business on extra standard No. 2s at $1.05; on No. 3 extra standards at $1.45.

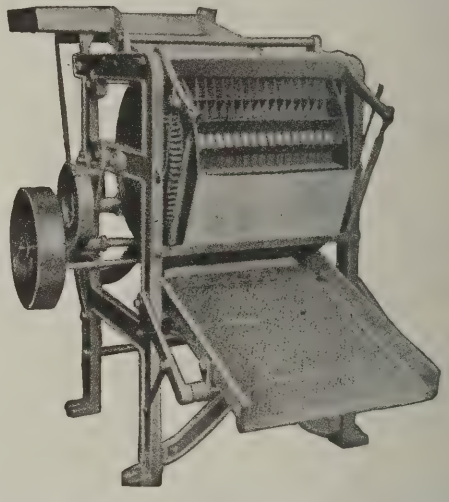
CONTINENTAL BROKERAGE CO.

Milwaukee, Wis., March 22, 1924.

Business is quiet as far as Wisconsin peas are concerned. Canners in most cases have withdrawn from the future market, and, as a whole, haven't enough spot peas on hand to bother about. Buyers seem satisfied with purchases up to date, and are not so free with orders.

There apparently isn't a case of spot standard corn left in the State, and there are but few offerings of extra standard corn, this grade being quoted at $1.05. Kraut has been moving slowly at reduced prices.

FRANK A. INBUSCH CO.

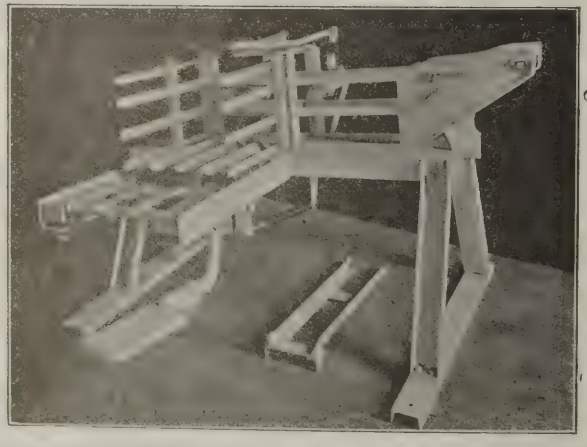


Fremont, Mich., March 22, 1924.

Sales of futures on canned vegetables have been gratifying. Indications as we see them lead us to believe that this will

LEWIS CUTTER

—FOR—



Beans, Okra, Celery, Rhubarb

FREMONT CANNING CO.

By DAN GERBER.

Wausau, Wis., March 22, 1924.

Business on future Wisconsin canned foods has been rather spotted during the past week. Some days there is a lot of inquiry. Other days there is comparatively little. On the whole, it has been rather quiet, necessarily so, for the reason that most canners are sold out and most buyers are covered.

There are so few spot Wisconsin canned foods in canners' hands that the volume of sales is very meagre.

GROCERS' SUPPLY CO.

Dict.: FRANK T. STARE.

Baltimore, Md., March 22, 1924.

Increasing demand for future tomatoes, from nearly all sections, was one of the interesting features in this market at the close of business this week. Not that the individual orders were larger than they were last week in point of quantity, but they were more numerous in point of number, which, after all, is the best character of buying, because, chiefly, it is free of the speculative element that goes with big buying, and is for the purpose of known, actual requirements. When any staple line of merchandise can be bought of manufacturers of integrity and established reputation for fair dealing at prices close to factory cost based on maximum capacity production, the chance of loss to the purchaser is reduced to the minimum, and such opportunities should be taken advantage of by conservative buyers. "The mill never grinds again with the water that has passed" is a proverb tried and true, and the opportunity to test it, as applied to future tomatoes, is at hand.

There is a firmer feeling in the market for No. 2 tins spot tomatoes, and the goods are in demand from the same widely-separated markets that have been buying that size steadily, chiefly for buyers' labels. For the other sizes, the demand was light this week, and, as a rule, the orders were small. The usual spring demand is expected to open up about April 1st, and broaden out in the following months sufficiently to absorb the visible supply here and elsewhere. It would be a "grand and glorious feeling" to see the market cleaned up by July and the new canning season start with bare floors everywhere. Statistically, this is not an impossibility.

Future corn, stringless beans, peas, spinach and potatoes were the leaders this week, although the sales did not keep pace with the business done in these items in the early part of the season. The other futures did not attract much attention, with the exception of herring roe, of which small lots changed hands when a seller could be found. We direct your attention to our future offerings on the last page of this issue, likewise for future peas and tomatoes on the inside pages, under their respective captions.

In line with our repeated warnings, the end of the pile of cut green stringless beans in Baltimore has been reached. Outside of a few small lots, they are sold out here, and in the county districts as well. Buy them wherever found. The same con-

"NOW BOOKING FUTURES 1924 CROP"

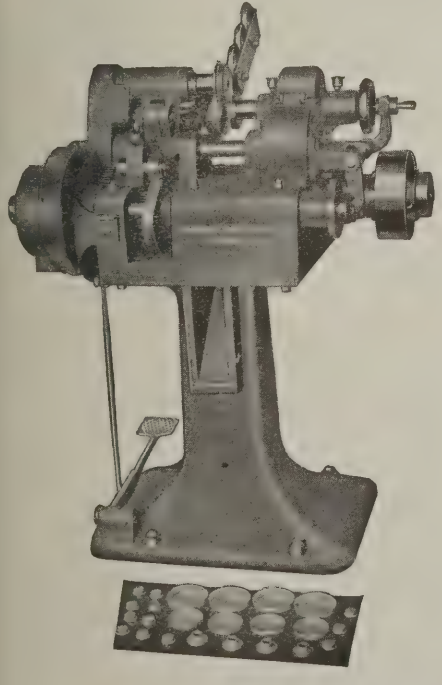
The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.



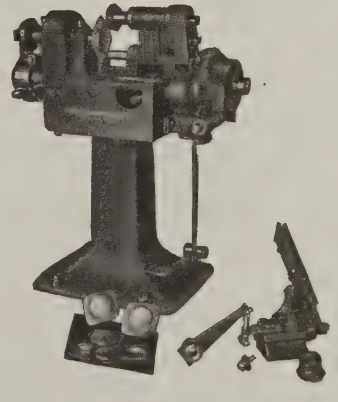
For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.



ONE BLOCK AHEAD OF THE PROCESSION

This No. 46 Thread Rolling Machine is worthy of a place in the "CAMERON FAMILY."

One user writes: "I find it a great advantage to be able to remove the automatic feed when I have odd-shaped articles to be threaded."

We make every machine for "can-making."

CAMERON CAN MACHINERY CO.

240 North Ashland Avenue CHICAGO, U. S. A.

dition is true of No. 3 spinach and sweet potatoes. Buy each of these items quickly if needed. Beets are sold out, with the exception of standard No. 10 tins whole, and the smaller grades in No. 2 and No. 3 tins. The demand for other vegetables was limited to the usual run of orders for corn, all grades peas, succotash and mixed vegetables for soup.

Fruits of all kinds were in better demand this week. Orders were received for strawberries, gooseberries, apples, pineapples and pears, and there was some inquiries for the other items.

Business in cove oysters is improving, as well as the demand.

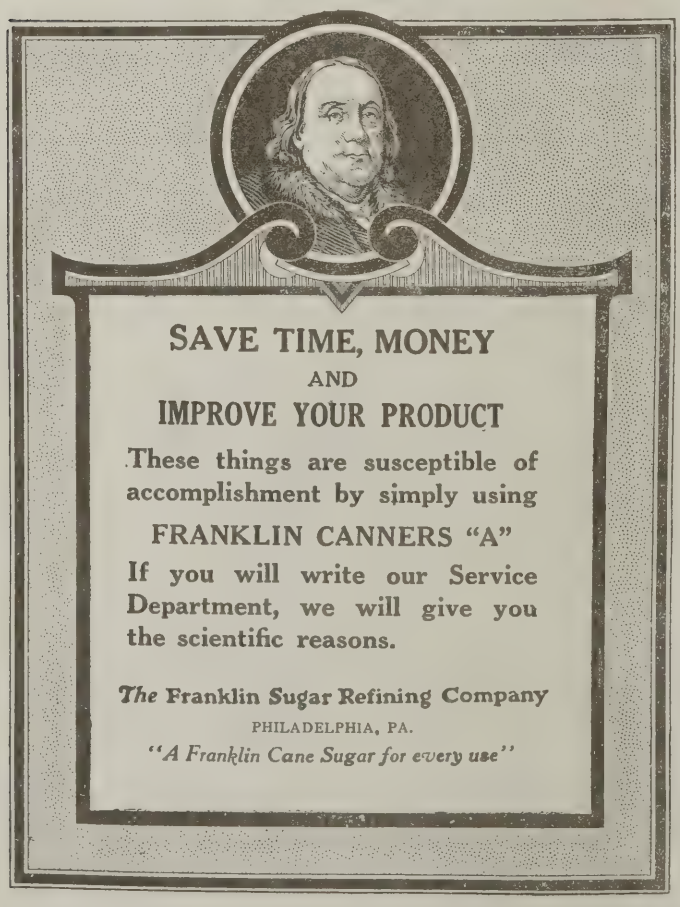
HEARING ON LABELING APPLE BASE AND PECTIN PRODUCTS.

THE labeling of apple base and pectin products will be discussed at a hearing held by the Bureau of Chemistry, United States Department of Agriculture, Washington, D. C., on April 16, 1924, according to an announcement sent by Dr. C. A. Browne to manufacturers of jams, jellies, preserves and similar products. The announcement states:



The Bureau of Chemistry will hold a public hearing April 16, 1924, at 10 A. M., in the Bureau of Chemistry Building, 216 13th Street Southwest, Washington, D. C., on the labeling of so-called "apple base" or "pectin" jams and preserves. Certain features of the labeling of jellies will also be considered.

The questions under consideration have been brought up in part by the recent decision concerning the labeling of so-called "fruit in sugar." The investigation that was conducted on the propriety of the use of the label "pure fruit in sugar" for an article prepared from 35 pounds of fruit to each 65 pounds of sugar showed that this article resembles a standard jam or preserve so closely in appearance, odor, taste and flavor that it cannot be distinguished from the standard product by the ordinary purchaser, and because of this close resemblance and because the name "fruit in sugar" is simply a synonym for the term "jam" or "preserve," and carries no intimation that the product is sub-standard, purchasers were accepting the article in the belief that it was a standard jam or preserve prepared from not less than 45 pounds of fruit to each 55 pounds of sugar. It was determined that the use of the expression "pure fruit in sugar" without certain qualifications in the labeling of this product creates deception, and is therefore a violation of the Federal food and drugs act, if the article is shipped within the jurisdiction of that law.

It was also shown in the course of this investigation that the use of the word "jam" or "preserve" as a part of the designation of a sub-standard product creates the false and misleading impression that the article is a standard jam or preserve, regardless of further descriptive matter that may appear on the label showing wherein it varies from the standard product. To meet these difficulties the following form of label was suggested:

"Fruit in Sugar
Strawberry
Not a Preserve
Prepared from 35% Fruit
and 65% Sugar."

All of the words in this label above the declaration of the percentage of ingredients are set forth in

type of equal size and prominence on a uniform background. The declaration of percentage of ingredients is set forth in type sufficiently large and on such background as to be readily observable by the purchaser. The Bureau indicated that it would interpose no objection to the sale of the article under this label.

In adjudicating numerous seizure actions brought under the Federal Food and Drugs Act during the past year against shipments of so-called jams and preserves adulterated with added pectin and excess sugar, the use of labels bearing the words "jam" or "preserves" has been permitted for relabeling the seized products. The following are examples of some of the labels used:

"Pectin and Raspberry Preserve"

"Pectin, Sugar and Raspberry Jam."

Pectin, pomace extract, apple juice and extract of dried apple skins and cores are not fruit within the meaning of the definitions and standards for jam and preserves, which require these articles to be prepared from not less than 45 pounds of fruit to each 55 pounds of sugar, and articles in which pectin, pomace extract, apple juice or extract of dried apple skins and cores is substituted in part for the required proportion of fruit do not exhibit the ratio between fruit and sugar required by the definitions and standards. Such articles are in fact sub-standard products. They differ from the "fruit in sugar" preparations only in the substitution of pectin, pomace extract, apple juice or extract of dried apple skins and cores for the excess sugar present in that product.

It will be the purpose of the hearing to afford those interested an opportunity of offering suggestions in the light of the facts set forth above concerning the appropriate labeling of these so-called apple base and pectin products. An expression is particularly desired as to whether any form of labeling can be devised using the word "jam" or "preserve" except in the way employed at present in the labeling of "fruit in sugar" without creating the impression in the mind of the purchaser that the article is in fact a standard jam or preserve. Suggestions by letter will be appreciated from those who are unable to attend the hearing.

NOW IT'S LEE, KAUFMAN & GALE.

LEE, Kaufman & Gale, Incorporated, has succeeded the canned food brokerage firm established as Lee & Kaufman, Chicago and Grand Rapids. There is no change in the personnel except the addition of E. P. Gale, who is favorably known to canners from coast to coast, and who has been actively in contact with Chicago wholesale canned foods buyers for several years past while associated with a Chicago canned food brokerage firm.

The incorporation and expansion for the business will establish this concern as one of the larger brokerage firms of Chicago territory, and in view of the extensive acquaintance, long experience and varied abilities of the men connected with the corporation its prospects for continued success are regarded as excellent. The three members of the firm are: John A. Lee, L. W. Kaufman and E. P. Gale.

The Markets

BALTIMORE, MARCH 31, 1924

WEEKLY REVIEW

Deflected Stocks, Small Buying for Quick Turnover, Feature the Market—Business Is Good and Promises to Remain So—Changes in Prices All in Upward Direction—Spot and Futures Both Well Sold Up.

BUSINESS TOO GOOD—"Holy Mackrel!" Too good?—when a broker has to sweat around all day and cannot make enough to pay his office rent? Too good! Where do you get that stuff?" "Too good?" asks the wholesaler, "when a lot of 50 to 100 cases will keep me going a whole week, instead of buying a string of carloads?" "Too good?", says, the canner, "when I haven't sold a case of goods for months—I have any to sell!" And there is just the reason: the goods have been taken away from the canner down to the last case—in these fifty to one hundred case lots, because the wholesaler is trying to turn around on a nickel more often than a dog trying to lay down—and business has been and is good with the retailer and the chain store—fine as frog's hair, as one fellow said. The only sufferer in this is the broker, and he is a real sufferer, and because he is the one who has all the "market dope" we get a full share of his complaint.

We might very easily kick in with a growl here, because we cannot furnish the amount of snappy market information, news and helps that we would like to—because they are not there to furnish, and we are not in the manufacturing business. We feel more like rejoicing that the whole business is in such fine shape; that the stocks of spot canned foods have been sold down to such an extent that the game is now to find any suitable goods, and that the canners, per se, can sit back comfortably and look on at the struggle of men trying to put more money into their pockets. The market is not dull much less dead. On the contrary, it is bristling with life; active, energetic and moving constantly. It merely lacks those old-time features of train-load purchases—at cost or below, so far as the canner is concerned, and destined to languish in warehouses while the speculators try to force a profit! and failing this, to creep out in the early days of the next season to ruin any market possibilities that the new year might hold for the canners. The market is fine; it was never better and we could wish nothing better for our readers than that it might continue so for many years to come. And it easily can if the canners will guard their productions so as to see that nothing but quality goods get out.

NO NEED TO FEAR—The action of the bankers—those Old Men of the sea on the backs of all business and whose branches are springing up on every corner and thereby piling up a score which will be heavier in its exactions than were ever the saloons which they have replaced—in restraining credits and holding down business, have caused a feeling of fear and uncertainty in every line of industry, as if some trouble were impending. Economists, however, tell us that preceding all monetary troubles, or as they used to be called panics, there always appears a decided and drastic lowering of land and property values, especially land values. If this hypothesis be correct, then we need fear none of the troubles which these money-changers hint at, because land values are advancing. Business houses and offices generally are forced to seek new quarters—an amount of moving such as business has never before seen—all due to advancing rents and increasing property values. On that basis business may be considered unusually stable and the prospects as bright as anyone could possibly wish. This is an important feature now at the opening of a new canning season, and it just adds one more bright ray to the already pleasant outlook. Business has to pay for the palatial structures and innumerable branches of the banks, and this tax upon all business is out of all proportion to what it should be. This score will, one day, have to be squared up and it will be a troublesome one, but it is probably quite aways in the future. It is one, however, which business men should think about, and put a curb upon. The money-changers are exacting too much, if not actually their pound of flesh.

The horrifying picture from which the veil is now being torn in Washington, disclosing the bartering of our highest offices by parvenues seeking seats of authority, is nauseating, as with the curetting of a cancer, but the results from it will be good, if there is any backbone left in the people of this country. This will rather help business than hurt it, for we will be better off after cleaning out the nasty mess.

Has this anything to do with the canned foods market? Not if you think canned foods, and their market, stand isolated and alone and are in no way dependent upon general business conditions and activities in this country. But if you recognize them, as they are, as a mere link in the great chain of business, then this is of vital importance, and should be touched upon, at least, in these columns.

MARKET CHANGES—The activities of the market are shown in changes and that they are all in an upward way means much. No. 2 spinach is marked out of quotation in this market; No. 2½ remains at $1.50, but No. 3 spinach is now quoted at $1.60. And it will be noted that due to unfavorable crop conditions on the Coast, California has practically withdrawn from the spinch market, and prices are advancing.

Sweet potatoes are growing to very small compass in spots and the prices advancing. This week shows No. 3 potatoes quoted in the counties at $1.50.

A New York City broker attracted much attention to himself by predicting that No. 2 spot tomatoes would be $1.00 by June 1st. Had he named a price of $1.20, he might have been entitled to the notoriety, for spot No. 2's have been $1.00 or better with many holders for a long time, and are generally at that figure in Baltimore today. They may not reach $1.20 before next packing season, but that figure would not be surprising to many who are in the know. They have moved up this week to that figure, and we expect to see them keep moving from now on.

Damage to the fruit crops on the Coast has caused values in peaches to stiffen and advance, and most fruits will no doubt follow suit.

Other than these few changes the market remains as it has been—strong, with advancing opinions by holders as their stocks are gradually cleaned up. Futures are rapidly working themselves into the same relative position as spots, and more and more canners are withdrawing, because they have reached their limit. If there are weak sellers of futures, it is their own fault, because they do not know what they are doing. As one writer said, in reference to our remarks last week, anent the selling of future tomatoes at or below cost, "You are dead right, only you did not lay it on heavy enough."'

NEW YORK MARKET

Buyers Extremely Cautious—Dollar Tomatoes Predicted—California Spinach Market Moving Up as Packers Withdraw —Damage to Peaches Causes Reaction in Market Asparagus Selling Well—Tomatoes Firm —Southern Spinach Lower Than California—Notes.

New York, March 27, 1924.

By "New York Stater,"

Special Correspondent "The Canning Trade."

MARKET Uneventful—While there has been a healthy undertone to the market locally during the past week, there have been no material changes in the general situation. Buyers are in the market for small quantities, and are not buying beyond immediate needs. In view of the general quiet on spot, it is interesting to note the jobbers' attitude on spots.

Won't Take a Chance—One well-known canned foods broker, discussing the present market with The Canning Trade's correspondent, said: "The market is extremely conservative just now. A buyer will give you an order for 200 cases of some item at, say, $1.50 per dozen. A week or ten days later he will call you up and tell you he wants 20 cases more at $1.50. You tell him you can't get the goods at less than $1.60, and after a while he will buy at that figure. You then tip him off that in another week or ten days the market will probably be $1.65 or $1.70, but never a 'tumble' from the buyer. Spot holders now are quite confident, and they have the market completely in their control on wanted items, but despite this there is no inclination to speculate a little shown by any of the buyers."

Sees Dollar Tomatoes—Another broker, discussing the market, turned to Maryland tomatoes, and ventured the prediction that we will see a $1.00 market on standard 2s by June 1st at the latest. This particular broker added that he is not trying to get the buyers to believe this, as they would only reward him with a laugh for his pains.

Spinach Up—The California spinach market, which was easing off during the early part of the month, has turned about face. The California Packing Corporation and a few other packers have advanced their prices while other packers have withdrawn from the market. Crop damage due to the long drought is the cause of the strengthening market.

Bullish on Peaches—Wires received from the Coast today are extremely bullish on canned peaches. Heavy crop damage to peaches is reported by frosts, one canner reporting that the bulk of the crop in the principal canning peach-producing sections had been killed off. The trade here is taking these reports with numerous grains of salt, however, and look upon them as typical Coast propaganda. It is significant to note, however, that some of the leaders in the California canning field have temporarily withdrawn on spot peaches for immediate shipment.

Asparagus Sales Good—Demand for asparagus has been good during the week, and the new California pack is now well sold up. New Jersey canned asparagus has come on the market in a small way during the past two or three years, and has met with a very good demand for distribution under jobbers' private labels.

Future Tomatoes Firm—A steady market for future Maryland tomatoes is reported, canners quoting on 100 per cent contracts at 55 cents for 1s, 87½ cents for 2s, $1.25 to $1.27½ for 3s, and $4.00 for 10s, all f. o. b. country canneries.

Spot Tomatoes—Peninsula packers are quoting the market for prompt shipment at 62½ cents for 1s, 95 cents for 2s, $1.37½ to $1.40 for 3s, and $4.65 to $4.75 for 10s. For buyers' labels a premium is demanded on each size. Baltimore city canners quote spots for immediate shipment at 62½ cents for 1s, 95 to 97½ cents for 2s, $1.40 to $1.45 for 3s, and $4.75 for 10s, all prices f. o. b. cannery.

Future Southern Spinach—Maryland canners are quoting spinach on future contracts at $1.00 for 2s, $1.40 for 2½s, $1.45 for 3s, and $4.25 for 10s, all f. o. b. cannery, shipment when packed. These prices compare to the last prices of the California Packing Corporation on California futures of $1.10 for 1s, $1.30 for 2s, $1.60 for 2½s, and $5.00 for 10s, f. o. b. California cannery. With this differential price and taking into consideration the higher freight rate from the Coast, Southern canners should be able to do a good business on their futures, particularly in view of the fact that many of the California canners have withdrawn from the market.

Corn Quiet—There has been little of interest in the market for Southern standard corn, either spots or futures, during the week, and the market holds nominally unchanged at 92½ to 95 cents for spots and the same range on futures.

Notes of the Trade—Charles G. Griffin, of H. C. Hemingway & Co., of Syracuse, N. Y., was a visitor in the trade yesterday, making his headquarters with his brokers, North & Dalzell.

Sanford & Timpson are now New York sales representatives for the Canastota Canning Co., of Canastota, N. Y.

A. E. Love is now a member of the canned foods sales force of Wm. H. Stanley, Inc.

Allan T. Bacon, of Bacon & Trubenbach, is back from a week's trip among Maryland canners.

S. P. Sanford, sales manager for the F. E. Booth Co., canners, with headquarters at San Francisco, is visiting the West Side trade this week.

Ernest Stellenwoerf, well known to the local canned foods trade, is now a member of the canned foods sales force of Butler & Sergeant, Inc.

Walter J. Sears, of Chillicothe, Ohio, was a visitor in the local market this week.

CHICAGO MARKET

Corn Up to $1.00—Warehouses Nearly Empty of Goods—Low on Other Lines of Foods, Also—Plenty of Apples Here— Corn in No. 1 Cans—Convention Promises to Be One of the Largest.

Chicago, March 28, 1924.

By "Wrangler,"

Special Correspondent "The Canning Trade."

THE Market—The canned foods market is like the black man's dog which he said would be fat if he had anything to feed it on. About the only thing in canned staples, of which there is sufficient stock to justify a broker to work on, is canned corn, and buyers are taking hold of it nicely, and the price has run up on standard 2s to $1.00, f. o. b. canneries, wherever it it to be found.

About all the canned corn of full standard quality to be had for 95c f. o. b. cannery has been sold.

I heard of a block of 2s canned corn which had been rescued from a cannery fire, having been damaged only a little by water, being offered on the Chicago market and held at $1.00 per dozen f. o. b. cannery, and that an offer was made of 90c on the entire block and refused by the owner.

I merely state these facts in order to show the strength of the market.

In conversing with a public warehouse manager of Chicago a few days ago, he stated that there are practically no canned foods in the warehouses of Chicago; that is to say, that the quantity as compared with previous years is insignificant.

He did not understand why it was, and I tried to explain to him that it was because there was no surplus of canned foods this season, and that wholesale grocers had adopted a policy of buying in small quantities, and carrying small stocks, and, therefore, found themselves with nothing in canned foods to put in public storage. I also told him that canners had established their credit in a few years past with bankers so that they did not have to ship their output to metropolitan warehouses so as to be able to secure loans.

He stated, however, that the situation was about the same with wheat flour, and that the public warehouses of Chicago probably had less flour on storage than for many years. He stated that he had called on quite a number of dealers to get information why the condition prevailed, and that they told him that the railroads in order to secure shipments of flour over their

lines were making such a low rate of depot storage that dealers could not afford to put the goods in warehouses.

The flour dealers also said that grocers, wholesale and retail, had for a year or more been buying in such a small way that carloads of flour on arrival would be divided up and delivered from track switches.

This situation is very similar to that of caned foods, and I suppose that it is the case with other lines as well.

It seems to me that canners and the canning industry have nothing to complain about, and that their general situation is, from a comparative standpoint, eminently satisfactory.

I am told that the cold-storage warehouses of Chicago are crowded with crated or boxed fresh apples, and I can believe it from my own experience, as I buy and eat apples every day to top off my lunch, and I have noticed that the little corner grocer of whom I buy apples daily offers the finest assortment of varieties I have ever picked from—Roman Beauties, Wine Saps, Greenings, Baldwins, Ben Davis, Johnathans, Newtown Pippins, Russets, Delicious, Jenitons, and several other varieties, and that little grocery sells a truckload of apples daily, most of them at a nickel apiece for the eating varieties.

I note that the exportation of barreled and boxed apples is very heavy.

I was talking to an Iowa canner today, and he said that he had sold 88,000 cases of No. 1 canned corn this year, four dozen to the case net, 11 oz. contents; that he sold 77,000 cases last year, and only 17,000 cases in 1921, that being the first year he had packed the size. This seems to show that a heavy demand is springing up for a small can of vegetables, probably from the apartment dwellings of the city, and what is known as the kitchenette trade. The price asked for the size is 75c for extra standard and seems disproportionate, from the consumer's cost standpoint, as compared with the No. 2 size.

The National Kraut Packers' Association will hold a meeting at the Hotel Sherman, Chicago, on April 22, at 10 A. M., conjointly with the Western Canners' Association. The Catsup Section of the National Canners' Association will also hold a meeting conjointly with the Western Canners' Association at the Hotel Sherman, Chicago, April 22, 23 and 24, or during the convention of the Western Canners' Association.

The convention of the Western promises to be one of the largest ever held and it will be the fortieth.

ST. LOUIS MARKET

Spot Stocks in Small Lots Being Taken Quickly—Tomatoes Are Steady—California Tomatoes Selling—Market Advancing on Spot Peas, Due to Scarcity—Spot Corn Is Scarce—Northwestern Canners Withdraw Tentative Prices on Fruits—California Uncertain as to Its Season.

St. Louis, Mo., March 27, 1924.

By "Missourian,"

Special Correspondent "The Canning Trade."

DEMAND—There is a fair demand only for all canned foods. The call, however, is mostly for spot distribution in small lots, and not for factory shipment. Spot stocks are being taken quickly, and there is no haggling over the price. If the buyer wants what the seller has, there is no question on price. The question of supplies seems to be of more importance than price. In futures most canners have sold up to the safety limit on staples, and there is an indifference as to futures. Many canners of corn, peas and tomatoes in the West have signed up so extensively that they have pulled out of the market.

Tomatoes—The tomato spot market is steady, the demand is mostly for immediate needs, and generally in moderate-sized lots. Some goods are offered from the Pacific Coast and from the South, which are available at once and at prices satisfactory. California 2½s are sometimes shaded by the weaker holders, but others desire to hold their goods for a later market. There is very little doing in gallons. New packs are not being sold freely, as jobbers seem to prefer to wait until later before signing up. The prevailing quotations for futures, f. o. b., are: No. 2 standard, Indiana, $1.15; No. 3 standard, f. o. b. Indiana, $1.65, and No. 10, f. o. b. Indiana, $6.50.

Peas—There are few available spot peas. Many jobbers are out of the majority of varieties, and the result is that the market is working upward, and is about 20 cents higher than a couple of weeks ago, and about 35 cents above the 1924 range. Dealers are covering with confidence, as all holdings are light, and a clean-up is expected. The same strength noted in new packs for several weeks continues, with a fair amount of business placed. The peak of the buying, however, is passed. Many buyers who have been tardy in covering are looking for Southern and Wisconsin packs. Futures are firm. Some little trading is going on, but the canners are so well booked up that they are indifferent to adding to their contracts. Prices are, f. o. b. from point of shipment, as follows:

Fancy No. 1 Alaska, Wisconsin	$2.65
Fancy No. 2 Alaska, Wisconsin	2.20
Fancy No. 3 Alaska, Wisconsin	1.70
Extra Standard No. 2 Alaska, Wisconsin	1.00
Extra Standard No. 3 Alaska, Wisconsin	1.60
Extra Standard No. 4 Alaska, Wisconsin	1.35
Fancy No. 2 Sweets, Wisconsin	2.25
Fancy No. 3 Sweets, Wisconsin	1.90
Fancy No. 4 Sweets, Wisconsin	1.65
Extra Standard No. 1 Sieve Sweets, Wisconsin	2.00
Extra Standard No. 2 Sweets, Wisconsin	1.65
Extra Standard No. 3 Sweets, Wisconsin	1.40
Extra Standard No. 4 Sweets, Wisconsin	1.35

Corn—There is but little surplus of spot corn, and full prices are obtainable if they are true to grade. Fancy is wanted, particularly Crosby and Golden Bantam, and is being picked up where it can be found, but there are few offerings. Standard also shows more strength. Futures have sold well in fancy lines and less freely in standard packs. Futures show little change since last week.

Fruits—The withdrawal of tentative prices on Northwestern fruits by some of the canners has been a feature. Quotations on some lines were named some time ago, but on a basis which did not appeal to a majority of buyers. Bookings were light because buyers did not show much interest in futures. California canners believe the season as too uncertain to name definite prices, but are ready to book s. a. p. business. Packers made contracts with growers for fruit deliveries to the canneries, and because of a prospect of a light yield, more money is wanted than last year. A canvass of holdings on the Coast shows that there are only a light quantity of 1923 lines in volume and in assortment. Holders think that last year's surplus will be good property, as new pack cannot be offered at a low range, and the carry-over is so light that it will easily be liquidated. The spot market is quiet as to daily business, but there are evidences of greater strength. Standards and seconds peaches are held with more confidence and cannot be had at prices prevailing a few weeks ago. Assurances that the 1924 pack will not be any heavier than that of 1923 have also helped the situation.

Milk—Condensed milk is in normal demand, with most of the buying orders from domestic outlets. Local quotations vary considerably on unadvertised brands, which are in indifferent demand.

SEATTLE MARKET

Trade Turning to Futures—Trouble Caring for Sorted Cars—Trade Seems Well Supplied With Salmon—California Sardines in Place of Chum Salmon—Apple Market Has Eased Off.

By "Nomlas"

Special Correspondent "The Canning Trade"

Seattle, March 27, 1924.

Futures—With spot business on canned salmon of rather small proportions during the past week, the trade is beginning to turn its attention to futures. There has been quite a little s. a. p. business booked thus far in the game, but none of the larger factors have as yet named a price basis, either tentative or formal.

Assorted Cars—Packers declare that they are having increased difficulty in taking care of assorted car business and selling agencies report the same difficulty. The trade is still able to take care of carlot business on the leading grades, but carload buying has been conspicuous by its absence this week.

Trade Supplied—The opinion is expressed locally that the trade is rather well supplied on its current salmon requirements, business during the first two months of the year having been rather active. The Southern trade is expected in the market shortly for pinks in quantities, however, to take care of the spring and summer demand in Dixie.

Chums vs. Sardines—One well-known local trade member xpresses the opinion that California sardines packed in 1-pound val cans have cut into the export trade in chum salmon to some xtent. The California sardine packers are now putting a qual-ty product on the market at a reasonably low price, and the ompetition of this item is being felt by the salmon operators.

Prices—There are some chums still to be had at $1.20 for Alaska pack, with reports of Coast packed goods in small lots at cents less. Pinks remain unchanged at $1.25, with reds at 2.25 to $2.35, the top price applying to the featured brands. One ffering of a few thousand cases of red flats, Peninsula trap-aught fish, was reported during the week at $2.65.

Apples Weaken—It is reported that Northwestern packers re still carrying fairly sizable stocks of solid pack No. 10 apples nd the market has eased off a trifle. The market is quoted at 4.25 per dozen, f. o. b., but it is thought that business could be ooked at less in a few instances.

Trade Items—The Deep Sea Salmon Co., operating two large anneries in the Ict Straits section of Southeastern Alaska, has ppointed P. E. Harris & Co. exclusive selling agents. The Deep Sea Salmon Co. pack under the well-known Cape Edwards, Hero, Market, Twin B and Goodfellow brands.

Northwestern berries, frozen and packed in 50-gallon bar-els, have become an important item among packers in this sec-ion during the past few years, and packers are now naming pening prices on 1924 pack. A good inquiry is reported.

CALIFORNIA MARKET

Lack of Rain Worrying the Growers—Light Pack of Spinach in Prospect—Asparagus Needs Rain—Acreage to Peas Is Lighter—Fruits Not Affected So Directly—No Fruit Prices as Yet—Higher Prices Expected—Most Spot Stocks in Low Supply—Mechanical Hazards in Canneries.

San Francisco, March 27, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

CROPS Worrying—A light rain visited the southern and central sections of the State the third week of March, but nowhere was the precipitation sufficiently heavy to do much good. The crop outlook is still unsatisfactory in every line and in all sections of the State, and particularly in the southern part, where the rainfall is much below normal. Spinach is in very poor shape, and a light pack is in prospect. Asparagus needs rain, but late storms would greatly change conditions, as the packing season on this vegetable is a long one, extending from March until July. The acreage devoted to peas is lighter than usual, plantings were made late, and fields are in poor shape generally. The effects of the drought on deciduous fruits will be less noticeable than on early vegetables. Most of the peaches grown are in districts where irrigation can be practiced, and it is always possible to increase the size of this fruit by proper thinning. Pears and apricots are grown principally where irrigation is not practiced, except by pumping, and these fruits promise to run to small sizes. This was noted last year in regard to apricots, and the tendency is expected to be even more marked this year, especially if the fruit sets heavily.

The Prices—Packers have not announced opening prices on any varieties of California fruits so far, but something along this line may be expected in the no distant future, several interests planning to put out prices earlier than last year. In general, opening prices are expected to be higher than in 1923. Last year at this time there was quite a carry-over pack, and every effort was made to keep prices down to bedrock. Some of the cuts made were at the expense of the growers, and it was acknowledged by all interests at the time that fruit could not be grown profitably at the prices that prevailed. However, prices will be well below wartime levels, and a steadily increasing acreage means that it is unlikely that these will ever be approached again. Packers who have gone over their stock sheets of late advise that there are no large lots unsold in any line, with a very close cleanup in prospect. Cherries seem in larger supply relatively than other fruits, and at present prices are moving sluggishly. Last year packers refused to meet the demands of growers and cut prices sharply, but it seems that even at that they paid more for fruit than conditions warranted, since they are meeting competition from other producing States with considerable difficulty. It is expected that growers of both cherries and plums will be called upon this year to deliver fruit running to better sizes, the size question to receive attention shortly at the hands of the Canners' League of California. This is following out the policy adopted in regard to peaches, apricots and pears.

Peaches—Increased interest in California canned peaches has been noted of late, and some good-size shipments are going forward to the East coast. There has also been an increased business done in friut for salad. Eastern holdings in all fruits are understood to be low, and a good volume of trade is expected during the next few weeks. Pineapple has been quoted lower of late in the Eastern markets than on the Pacific Coast, but this situation is changing.

Salmon—Coast stocks of salmon are being cleaned up in good shape, with a special demand for pinks and medium reds. As long as stocks of these are available at present prices, reds will doubtless move rather slowly. Considerable interest is being taken in the prospects for the coming season, and predictions are being made that the output will show quite a gain over that of 1923. It is expected that old stocks will be about cleaned up by July, when new goods will be available.

Mechanical Hazards in Canneries—Guy A. Barker, engineer of the mechanical division of the California Industrial Accident Commission, recently made a report to this commission on "Mechanical Hazards in Canneries." In part, this is as follows:

"Once more the canning season has come to a close, and again there are a number of injured persons who look back into the days of rush and bustle with regret to a moment when they relaxed their vigilance just enough to permit the hand to come in contact with a moving machine or who too hurriedly crossed a slippery spot, only to fall and be injured either from the impact or by becoming entangled in some machinery.

"Of all the machines used in the canning industry, the one that probably accounts for more injuries than any other is the double-seamer. All machines of this type have rapidly revolving heads of irregular shape. The lid of the can is put in place and the can passed under these revolving heads, which hermetically seal the lid on the can. It often happens that a lid does not always remain in exactly the proper position, and there is a tendency for the operator to attempt to adjust it without stopping the machinery. Very frequently this results in injury to the operator. These rapidly revolving parts should be guarded so that a man cannot put his hand into a dangerous place without performing some operation which requires sufficient time for the danger inherent in the machine to come to his attention. Another source of injury on these machines is from the operators cleaning the dirt and grease from the stationary parts while the machine is in operation. Here the attendant allows his hand to get into a danger zone, and it is caught between a moving part and the framework.

"Conveyors always account for a good share of the injuries. Two types of these are the chief offenders, namely, the steel ribbon type for conveying spinach and other products, and the link-belt and lug type for conveying the cans. The ribbon type is made up of thin strips of steel about one-half inch in width and put together the same as the non-slip steel ribbon floor matting. The openings in this conveyor make it an easy matter for objects to become caught in them and in trying to remove the materials adhering to the conveyor or in working in close proximity to it, the operator's hands are often caught between it and the framework of the machine, frequently resulting in very serious injury. The best means of preventing such accidents is to arrange the conveying system so that no one be required to work at a place where the conveyor passes near enough to any stationary member that an injury may result. At all points where the conveyor passes downward over a pulley, guards should be installed so that it is impossible to reach or get into this point of down travel. Furthermore, no bars or other stationary members should be installed close to the conveying surface and where this surface must pass under them. With the link-belt and lug type for elevating the cans the hazard is simply that of shear between the lugs and the framework on the conveyor. It is a simple matter to eliminate this hazard by enclosing the sides of the conveyor so that the lugs do not project beyond the side members, thereby making it impossible for anything to be caught by the lugs.

"In addition to the two classes of accidents mentioned, there are those due to belts, pulleys, shafting, etc., that occur in every plant where power-driven machines are used. The hazards inherent in this equipment are increased in canneries because the floors and passageways are usually wet and slippery, and also because the average employee is not skilled in or accustomed to

working around machinery. Unusual protective measures and instruction made as thorough as possible must be employed to combat these conditions. Now, while the canneries are not in operation, is the time the employers should give the problem of accident prevention their serious consideration. Every process should be gone over carefully, every operation laid out and considered from the standpoint of safe working conditions, so that when the rush of the season is upon them the course to be followed is clearly fixed in their minds, and it is necessary only to impress the working force with the safe as well as effective manner of performing their duties. This procedure alone will reduce the annual toll of injured employees."

MAINE MARKET

Food Stuffs Moving Slowly—But Canners Don't Mind, as They Are Cleaned Out of Spots—A Little Fancy Corn Held in Small Blocks at From $1.75 to $2.25—Futures Sold Up—Stringless Beans Grow in Importance.

Portland, Me., March 28, 1924.
By "Maine,"
Special Correspondent "The Canning Trade."

GENERAL Trade remains very quiet in all lines, except movies, ice-creams and bead necklaces. All food stuffs are moving slowly and jobbers buy only for current needs. Brokers are busy scratching for a living, but local canners do not feel the lack of sales because they have no spot holdings to dispose of at this time.

There is a little corn in Maine, divided up among many owners and held in small blocks. Practically all of it is fancy grade, the Crosby being priced at $1.75 and the Golden Bantam at $2.10 to $2.25. The off-grade corn varies in quality, some of it being nearly up to fancy, and the prices for the different lots vary to match the quality of the goods.

Future Corn is about sold up, and still there are several pretty large buyers who have not covered their wants. This promises a good demand for any surplus after packing, or a sad shortage if the weather conditions are not right for a good crop. The price on futures has held very firm at $1.45 for Crosby and $1.70 and $1.75 for Golden Bantam. At present the yellow variety is getting rather scarce, while Crosby can still be picked up. No. 10 corn, which is offered by only a few canners, brings $7.25 and $8.50 for the two kinds.

Beans—The future of Maine stringless beans is assured, the only question being the canner's cost of production. The demand for these goods has shown a healthy growth, and today calls for about twice the up-put of a few years ago. Up to this time stringless beans have been "knitting work," to be handled at a season when the factory was otherwise idle. It has now reached the size of a principal line and is calling for improved machinery and careful accounting of costs. This, with the advance in cans, etc., makes the current price of $1.30 seem low to the canners. Future sales have already been heavy, and while the market is not actually bare of future offerings, it is increasingly difficult to place quantity contracts.

Mr. Tom Levy, who was associated for many years with the late Henry R. Stickney, is at present taking care of the orders on the Stickney milk filler and operating the Stickney shop.

Mr. and Mrs. Eugene R. Baxter (Portland Packing Co.) have returned from their usual winter sojourn in California.

What Canned Foods Distributors are Doing

Quality Canned Foods Winning New Friends for Industry—President Clark, of National Canners' Association, to address Jobbers—Recent Changes Among Canned Foods Distributing Concerns,

QUALITY canned foods are winning out with the wholesale grocer and the chain-store distributor, and the extremely heavy volume of business placed on the 1924 pack already bears testimony to the trade's liking for quality pack.

Canned foods distributors comment upon the fact that the past two or three years have witnessed marked improvement in the quality of canned foods produced by the great bulk of the canners, and the increasing consumption of canned foods shows that quality is really appreciated.

There are some canners who will say that the buyer wants quality products, but he is not willign to pay the price for this quality. That this condition is not generally so is proved by the fact that the so-called "quality canners" are usually the first to withdraw after naming opening prices, and that their prices are in most instances higher than those of the other canners in their particular field.

Officers of canners' organizations and the trade press have long preached the gospel of quality canned foods. If packers continue to improve upon the quality of their pack, distributors believe that steady gains in consumption may be looked for from year to year.

President Clark to Address Jobbers—Royal F. Clark, president of the National Canners' Association, will be one of the principal speakers before the convention of the National Wholesale Grocers' Association in Chicago in May.

It is understood that there will be a meeting of the Board of Directors of the National Canners' Association in Chicago, May 26, during the progress of the National Wholesale Grocers' Association convention.

"Swells" Allowance—The California Packing Corporation, in a recent announcement to the jobbing trade, has made known its plan for fixing percentage swell allowances on spot and future canned foods.

Allowances will be as follows: One-quarter per cent on canned peas, corn, string beans, pumpkin, squash, apple sauce, spinach, beets, succotash, tomatoes and tomato products and peaches; one-half per cent on other canned fruits and vegetables (sauerkraut and pork and beans excluded, no swell guarantee applying on these two items).

Those Early Contracts—Canners who booked future business on canned foods this year, granting one-half of one per cent allowance in lieu of swells, will comply with the provisions of these contracts, regardless of adjustments which have since been made by mutual agreement between representatives of the canners' and distributors' trade organizations.

Quite a little business was booked early in the year, with one-half of one per cent swell allowance, on items which are now being sold with a smaller swell allowance.

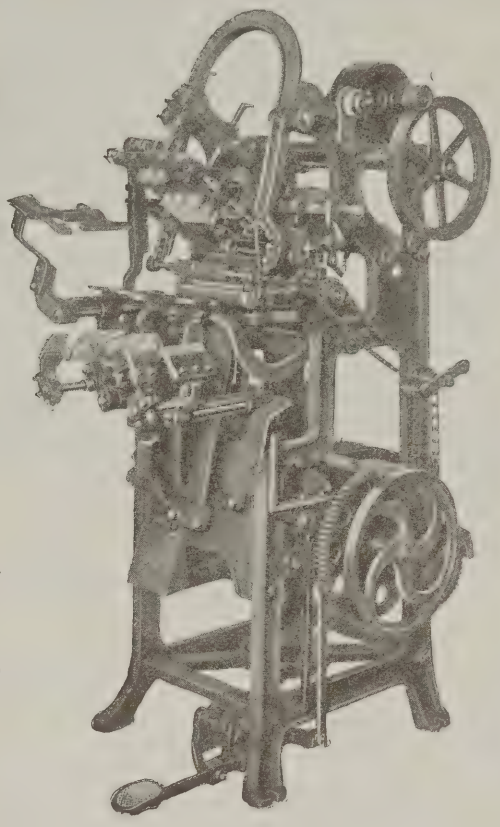
American Grocer Co. Expands—The American Grocer Co., prominent wholesale grocers, of Little Rock, Ark., has acquired the business of the W. H. Norwood Wholesale Grocer Co., at Comway and Morrilton, Ark. The personnel of the Norwood organization at these two points has also been taken over by the American Grocer Co.

The Federal Food Co., operating a chain of retail grocery stores in Brooklyn, N. Y., is floating a bond issue to provide funds for the expansion of business. Plans have been made for opening new stores to be added to the "Federal" chain.

R. A. Morrow & Sons have succeeded to the business of the Heath-Morrow Co., wholesale grocers, of Monroe, N. C. R. A. Morrow and his two sons, James M. Morrow and R. A. Morrow, Jr., comprise the new firm.

An illustration of the flourishing condition of the chain stores at present is furnished by the report of the Jones Bros. Tea Co., which shows sales of $2,021,957 for the thirty-day period ended March 1, as compared with sales of $1,367,211 in the 29 days of February, 1923. Sales from January 1 to March 1, 1924, totaled $3,836,762, as compared with $2,750,693 for the corresponding period in 1923.

The co-operative buying organization of the United Retail Grocers' Association, of Brooklyn, N. Y., is showing a steady expansion. Recently the business was moved to a new and larger warehouse, and canned foods buying is now being done direct at this warehouse.



F. W. Wagener & Co., wholesale grocers, of Charleston, S. C., have purchased the business of C. Wulbern & Co., Inc., of Charleston, for the past 54 years.

Spot Labeling No. 10 Cans

Was A Problem *Successfully* Solved
By The NEW ERMOLD Labeler

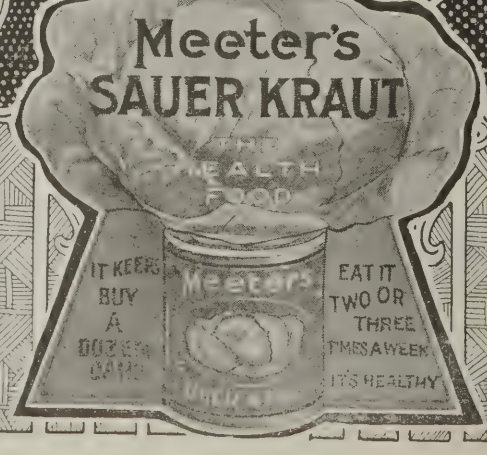
Foot of Thames St.,
BALTIMORE, MD.

Are people familiar with your brand?

Goods well displayed are half sold, and actual tests prove that good looking counter displays (silent salesmen) will positively increase sales.



How many brands of Canned Foods are actually called for by name? And isn't it true that crowded shelves confuse the purchaser so that the grocer's suggestions are usually accepted.

Why not let people become familiar with your label and ask for your brand by name? An attractive counter display will bring your can off the shelf down on the counter where it can be seen by everyone entering the store.

We have made a study of this subject and originated some particulary successful displays. May we plan one for you?

The U. S. Printing & Lithograph Co.

SMILE AWHILE

WHEN TALK IS EXPENSIVE

"Mr. Perkins," began the Secret Service man who was going through the countryside cautioning merchants against counterfeiters. "I have here a bogus ten-dollar bill and——"

"No, ye don't!" cackled the proprietor of Huckleville's largest and only general store. "Ye don't git me to bite again, young feller! I bought a bunch last week from some feller, an' I had the goldurndest time tryin' to get rid of 'em."

VERY GALLANT

Flub—Why do you suppose fat men are more polite than thin men?

Dub—I haven't paid much attention to it, but I suppose it's because they can give two ladies their seat, instead of one.

SOCIAL ERROR

So sweet, sprightly and well camouflaged was Miss Maidstone that her new middle-aged admirer scarcely realized that she had one hoof in the urn, so to speak. In fact, he went so far as to venture several roundabout queries as to her age. Finally she countered:

"I'll tell mine if you'll tell yours."

And then he wondered at the sudden frigidity when he replied, agreeably:

"O. K.—fifty-fifty."

ACCOUNTED FOR

Householder (after making a fruitless search of the pantry shelves)—Nora, don't tell me you've wasted that little bag of plaster I brought home yesterday?"

Nora—An' was that plaster, sir? Well, 'twas not wasted, f'r I used it in the gravy this very evenin'.

NO SUBSTITUTES

Have ye anny o' Fritzelpfeffer's Favorite Fried-cake Flour?" asked Mrs. O'Reilley of her grocer.

"We're out of that, but we have something just as good," he replied.

"Go on!" exclaimed the Irish lady. "If there was annything just as good, d'ye think I'd take the throuble t' mimorize that heathenish name?"

"AND OBEY"

Old Boy—How would you like to marry me?

Flapper—Well, I wouldn't mind——

Old Boy—Oh, well—er—I guess I can stand it if you just love and honor me."

A WORD IN PARTING

Alice—Isn't that a divine part that Charles has in his hair?

Grace—That's not a part. That's where the marble cracked.

NO ASSISTANCE REQUIRED

Little Jimmie was coming home from school when he saw his father in altercation with a tramp at the back door. Words led to blows, which culminated in the tramp going down under a staggering blow.

That night, after Jimmie had finished his prayers, his mother asked if he had not forgotten the customary supplication for the Lord to take care of his father.

"Didn't forget it," retorted Jimmie, "but it's a waste of time. From what I saw this afternoon, Dad's perfectly able to take care of himself."

EDITORIALS

KILLING THE GOOSE — One of those fine, old Jewish characters, often met with, was a member of a canning firm in Baltimore in the early days of the canning industry; highly educated, well informed, a good thinker, and able to express his thoughts in an understanding way—he quit the canning business, because, he said, the industry contained within itself the elements of its own destruction. His contemporaries disputed this idea as regards canned foods generally, and rightly so, as history is clearly revealing. But had he addressed his remarks to canned tomatoes only, there are those who would today heartily agree with him. Except—and it is a most important exception—that the inherent weakness is not of the tomatoes, either in their natural or their canned state, but of the men who compose that branch of the canning industry. There is no finer food product either in or out of the cans than tomatoes. Would that as much might be said of the individuals composing the great body of tomato canners. It would not be hard to find men who know the canning industry and its history to say that there seems to be a fatality, a curse as it were, upon all who touch tomatoes in a canning way; a blight such as is attributed to the despoilers of the Pharaohs' tombs, robbing the victim of the ability to think and to act wisely. There are exceptions, as there always will be exceptions to all rules, but the impression we record is held more widely than many may think.

We have already called attention to the assinity, not to say damphoolishnees, of tomato canners at this time cutting their prices on 1924-packed tomatoes to or below costs, in the face of the finest clean-up of spot canned tomatoes the industry has ever seen. They could easily be selling at 10c to 15c per dozen above present Tri-State quotations on future tomatoes. True, the rumor-spreaders have made glowing pictures of the enormous pack of tomatoes which 1924 will produce. But even if these men who can plant and reap a bountiful harvest while the snow is yet on the ground, and many months before even a tomato plant is set in the field, were wonderous prophets and absolutely correct in their predictions, why should a man, with eyes wide open and of his own free will, deliberately take a certain loss before that dread happening has occurred? Would it not be wiser to wait until the deluge is here, wait until they are actually forced to loose money on their tomato-canning operations if they ever are so forced? It would seem so to us. Or are they helpless in the grip of this evil genii which persues the canner of tomatoes? At least, we know that it is utterly useless to warn them or to try to hold them against financial losses. There are those who say that the tomato canner would rather loose money than make it. It looks like it.

Lest we be charged with doing an "utterly useless" thing in making this preachment—in trying to wake up the tomato canners to their opportunity and to force them to make money at least this year with all its golden opportunities—let us hasten to add that our intention was not such, but to draw attention to another, and a new, form of foolishness which should be scotched at the very beginning.

There is a movement on foot, by one of the fairly-well-known canners, to put out a new size No. 2 can of tomatoes, a can slightly smaller than the regulation No. 2, which can be packed at 85c and sold by the retailers "without the consumers detecting the difference in size." Shades of Appert! Is there no honesty left in mankind? Is the old urge of the early dishonest canner who cut the fill of his cans—because the public could not see through the tin—until "Shadow Brand" canned foods became a reality and not a mere joke, to come back to plague us again? The Pure Food Law and the net contents requirement put this old swindle out, but now the size of the container is to be cut, but in such wise that the buyer will not notice it! The Government has been trying to standardize canned foods containers, but the industry has been very cold on the proposition. Is this the reason? And will the industry—and the jobbers—permit this new form of swindle? Modern morality, in this reign of the Pharasee, will reply that full value is given in the can proposed. And when the entrance of this smaller can is permitted, what will be the next cut, and where will it end? The slack filler was outdone, as you recall, by

still further curtailment of the amount put into the can, until the Shadow Brand was created by simply passing the food **over** the can and allowing its shadow to fall in, instead of the product.

But it is not only crass dishonesty and nothing else, but equally as foolish. What is cheaper than the tomatoes which go to fill the cans? The cans, the cases, the labels, and the labor which goes to fill the can are so much more expensive than the small pieces of tomatoes which could be saved by using the smaller can, that at least the tomato canners can afford to give the buyers a full can of honest tomatoes. If there is any greater madness shown in tomato canning than slack filling the cans, we can't think of it. It does not benefit the canner and it disgusts the buyer. What more completely harmful thing could be done?

But even if a saving in raw stock could be figured, it would be more than lost in the expense of producing the smaller cans and the changes in the machinery to handle them. The canmakers should put their foot down on this flat, and the machinery men should refuse to be parties to the swindle. And the industry should repudiate this attempt to cheat the public.

THE NEED OF BETTER INFORMATION—There are more big business men in the canning industry today than ever before; firms which have a corps of salesmen, traveling their territories, and keeping intimately informed on everything moving. They miss no opportunity to add to their information about market conditions, etc. They are the kind that a lot of little canners would say do not have to read a trade journal such as this; but, in truth, these are the men who are the closest kind of readers, so as to be sure to pick up every possible grain of information that can be found. In fact, that is why they are the big men they are. And it is the very absence of this spirit that makes most of the trouble in the industry. Particularly in tomatoes, but in other items also, we see where the sale of a few thousand or hundred cases by a man who hardly ever even reads his daily paper, much less his trade journal, will cause the whole market price of that article to tumble. That sort of action could never happen if all canners were close readers, and kept themselves informed on market conditions. The trouble with the industry is that too many of the canners are not informed properly; they don't know; and so when a too low price is named them, and they are urged to sell, they consent because they know no better. They are told by the cunning buyer that the trade journal does not know what it is talking about, and they believe him. They read their daily papers and believe what they see; they read other literature and believe it; yet when the trade journal, which is a specialist in their own business and makes a life study of their interests, says a thing, they can be told that it is not so, and they will believe the temptor, against their own best interests. The information needed by all to prevent such market conditions as now exist in future tomatoes is furnished them weekly, but is not used. When they learn to read carefully their trade journal, and turn back to it for quotations, they will be fortified with a clear understanding of the actual situation, as viewed by a disinterested but experienced party, and they will then not be so liable to fall victims to the foxy buyers. Until the industry is better informed it will fall victim to these drives. The information is given, but they do not use it.

What this industry needs above all else is better market information—that is the crucial need of the hours—and we believe everyone will agree with us in this. The Canning Trade has experts in every section of the country reporting the markets as they actually are—disinterested experts who tell things as they see them. It is good service and ought to be used more than it is, we know. But—"we can lead a horse to water, but we can't make him drink."

HAWAIIAN CANNED FOODS WEEK INSPIRES POEM

IN honor of Canned Foods Week, no less a personage than our good friend, J. D. Dole, speaking at the Honolulu Rotary Club luncheon, dedicated the following poem to canned foods:

"When March comes, and with it the trade wind,
And the snow melts on King Street and Queen,
Comes a week when the canners together
Sing in praise of the pea and the bean.

Of the peach and the fat sweet potato,
That tickle the palate of men,
All the things from New York to tomato
That they tuck in a shiny tin can.

It's the week that we know as Canned Foods Week,
With the streamers of red, white and blue,
That tell of canned foods without number
From everywhere brought here for you."

All Together Boys!

All Packers—

Before Placing Contracts for
Their Can Requirements

SHOULD CONSIDER:

First–QUALITY—
Second–SERVICE—
Third–EQUIPMENT—

Our many years of experience in Can-making enable us to produce Cans of A-1 Quality.

Our large and efficient corps of closing machine experts, our location on two railroad sidings, our dock on the water-front enable us to give the Service required.

Our connection with closing machine manufacturers enables us to furnish the latest, speediest and best closing machine Equipment.

Can you see any reason for not letting us take care of your requirements in the manner you desire?

High Points in Tomato Production

Summary of Lecture by *H. C. Thompson*
of New York State College of Agriculture.

IN growing tomatoes for canning in New York State, earliness is of special importance because of the relatively short growing season. The earlier the fruits begin to ripen the greater the total yield, since the crop continues to ripen until the plants are killed by frost. The following factors are important:

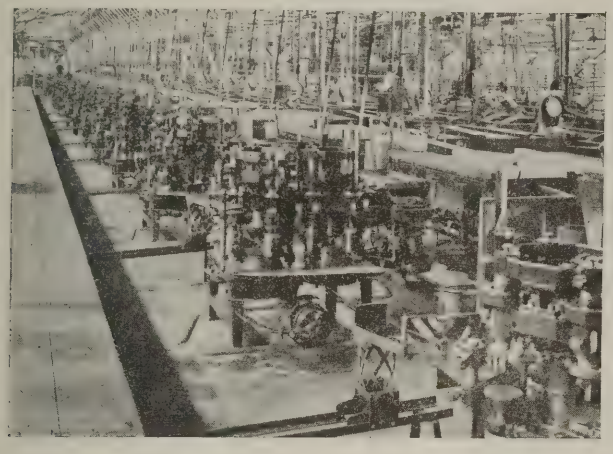
1. Use early strains of early varieties—Bonny Best, Chalk's Jewel and John Baer. These three varieties are very similar, there being practically as much difference between strains of any one of these as between the varieties themselves.

2. Use good plants. A medium-sized, stocky plant which has had a steady growth is superior to a large plant which has grown very slowly or one which has been grown rapidly then suddenly checked. The date of seed sowing should be determined by the space to be given in the seed bed or transplanting bed. Where plants are to be spaced 1 1-2 by 1 1-2 or 2 by 2 inches, six or eight weeks is sufficient time to allow from seed sowing to field planting. In experiments in Chautauqua county 50 plants to the flat (12x24 feet) produced about two and a half tons more fruit than 100 plants to the flat. Twice transplanting probably is not justified. In fact, in experiments where plants were transplanted twice the yield was considerably less than where only one transplanting was made when the space between plants in the flats was the same.

3. Plant as early as weather and soil conditions will permit. In a survey in New Jersey it was found that where plants were set before May 20 (1920) the yield per acre was 6.59 tons, when set May 20 to June 1 the yield was 5.47 tons; June 1 to June 10, the yield was 5.37, and when planted after June 10 the yield was only 3.86 tons per acre. Similar results were secured in New York in 1919 and 1920, as shown by the following figures:

Date set.	Number of farms.	Yield per acre tons.
1919		
May 10 to 24	31	8.9
May 25 to June 5	191	9.8
June 1 to June 10	70	8.10
1920		
May 15 to 27	40	11.69
May 28 to June 5	75	11.80
June 6 to June 15	18	7.85

Fertilizers—Experimental and survey results show the importance of phosphorus. In general farm rotations on the better soils 500 to 750 pounds of 16 per cent of acid phosphate alone is recommended, especially where manure is used in the rotation. Phosphorus has a tendency to hasten ripening. On lighter soils, and especially where other cultivated crops are grown in the rotation, a complete fertilizer is justified. The amount and kind of fertilizer to use depends largely upon the richness of the soil, but experiments in Chautauqua county indicate that a larger quantity than is commonly applied can be used with profit. On the basis of this experiment it would seem that 1,000 to 1200 pounds of 4-12-4 mixture could be used with profit on the lighter soils. If a fair application of manure were made to the tomatoes or to the crop preceding tomatoes, only acid phosphate would be needed.



Broadcast application of fertilizer is the best method where the quantity is above 500 pounds to the acre. With 500 pounds or less applying in the furrow with a fertilizer distributor is just as good as broadcast application and under some conditions it may be even better. Application should be made before the crop is planted. Distributing the fertilizer around the plant after it is set is the most expensive method and does not give as good results as the others under average conditions. If the soil is dry when the surface application is made the fertilizer remains where applied until a rain dissolves it and carries it into the soil.

Planting—Early planting has been mentioned, but it should be brought out that setting plants before the danger of frost is over may so retard growth that ripening would be delayed. In general the plants should be set out as early as possible after the danger of frost is over. It is desirable to take up the plants with a ball or block of soil adhering to the roots. To accomplish this the bed should be thoroughly soaked several hours before the plants are to be taken up. Blocking the plants by running a large knife or other cutting device through the soil between the rows and between the plants in the rows is a great aid in getting the soil to adhere to the roots.

Planting distances vary considerably. In some regions the plants are set 3 1-2 by 3 1-2 feet in the field, while in others they are set 4 feet by 4 1-2 feet. In experiments at Ithaca plants set 3 by 4 feet produced a considerably larger yield than 4 by 4 or even 3 1-2 by 4 feet. Under most conditions 4 by 4 feet should be the maximum, and less space would probably be better. Machine planting seems to be satisfactory where care is used in handling the plants.

Cultivation—The number of cultivations is of much less importance than the time of cultivating. Preventing growth of weeds is the main advantage of cultivation, and the best time to destroy weeds is before they have gotten a start. Even small weeds take a large amount of moisture and fertilizing materials from the soil, so that destroying them before they start is an important conservation measure. Very little is accomplished by cultivating when there are no weeds and the surface soil is loose. Deep cultivation should be avoided after the plants reach considerable size, because this destroys many of the roots. Shallow cultivation is better and safer at all times, and even this should cease when the plants meet between the rows.

Fighting Corn Borer Menace

Determined Effort to Wipe Out Pest Now Invading Ohio— To Loose 50,000 Insects.

THE United States corn belt, the world's greatest food-producing area, is threatened by the advance of a European insect army. To meet the menace of the invading corn borers at the frontier 80 entomologists, agronomists and county farm agents from Illinois, Indiana, Ohio and the Federal Government will in April officer a great offensive along a wide front in Northern Ohio, according to war plans outlined by Prof. George A. Dean, of the United States Bureau of Entomology.

An expert will be placed in every township of the infested area and some 20,000 farms will be visited to show farmers how to check the spread of the insects by destruction of the remnants of last year's crop. Later in the season some 50,000 insect allies drafted from among the foes of the corn borer in its native land will also be used in the fight.

Entered With Broom Corn—The European corn borer entered America very probably in broom corn shipped from Italy or Hungary. It was discovered attacking sweet corn near Boston in 1917, and since then it has been a limiting factor in the growing of sweet corn in Eastern Massachusetts. Another extensive area was occupied around Schenectady, N. Y. The insects also gained a foothold in a wide section north of Lake Erie in Ontario, Canada. Later the territory along the American shore of the lake in New York, Ohio and Southeastern Michigan became infested. Last year a marked spread of corn borers was noted in Northwestern Ohio, which is the beginning of the great field corn belt of America.

The strategic importance of this infestation in respect to the corn belt aroused other corn-raising States. Illinois, 200 miles from the present front, is sending experts to Ohio to co-operate in the work, as is the yet uninvated State of Indiana. Canadian authorities also are working with the Americans to control this dangerous enemy.

In the fall the corn borer, in the form of a brownish caterpillar or worm about an inch long, which has been tunneling into the plant, hibernates for the winter.

Active in Spring—As soon as warm weather begins, in April or May, the borer becomes active again, and about the middle of May it cuts a small circular opening from its tunnel to the surface of the plant in order to provide an exit for the future moth. It then closes this hole with a thin partition of silk and goes back into its dugout gallery, where it spins a thin cocoon. About the first week of June the borer emerges as a moth, which can cover as much as 400 yards in a non-stop flight and travel anywhere from five to ten miles. The female moth usually lays her nearly flat little eggs in clusters on the under side of the leaf. The young borer, hatched from these eggs, eats for a while on the leaves and then starts digging for itself into corn stalks, corn cobs, weeds or other plants, where it completes most of its development, incidentally injuring the plant.

The corn borer attacks all parts of the plant, and while it prefers corn and sorghum, there are some two hundred species of plants which it is known to attack. The most successful method of getting rid of this pest has been found to be the destruction of the remnants of the crop in which the borers hibernate.

Foe of Insect Found—Entomologists at the United States laboratory at Hyeres, near Marseilles, France, have discovered a parasite known as Exeristes roborator, which may prove an effective ally in checking the further spread of the borers by preying on their young, which it is able to locate through corn stalks or even burdock stalks. Fifty thousand of these insect foes of the corn borer will be released this summer in the infested areas of Ohio and New York.

CANNED FOODS WEEK A BIG SUCCESS

ROYAL F. CLARK, chairman of the Canned Foods Week National Committee, reports that the success of the 1924 campaign is an illustration of the increasing value of continued publicity. Reports being received by National Chairman Clark and the office at Washington indicate an even larger increase in sales of canned foods than was anticipated by anyone connected with the campaign.

Not only is this feature encouraging, but also the fact that increasing numbers of canners, distributors brokers and supply men are co-operating each year Many are the expressions received from them of their entire satisfaction with the results of the campaign in 1924 and their expression of interest in the coming campaigns as well as assurances of their continued co-operation.

The financial support from canners was better in 1924 than in any of the previous campaigns; more advertising was done by the local committeemen and more red, white and blue streamers were used than ever before. The requisitions for supplies were sent in much earlier by the local committees than they had been in the preceding campaigns, and this enabled the Washington office to get supplies in the hands of the committees in ample time for the campaign. The retail grocers who co-operated—and there were literally thousands that did so—are more than pleased and are looking forward with renewed interest to the future campaigns. One retailer said he had to reorder canned foods three times during the week so as to keep a supply on hand. Another one said his sales on Saturday alone amounted to $975.

There were many splendid radio talks again this year. These reached many thousands more people than the talks given a year ago, owing to the enormous increase in the number of radio fans.

An entirely new feature of the campaign this year was the canned foods luncheons served at men's clubs. For these luncheons canned foods menus were prepared and this was probably the most popular feature of the campaign. It is estimated that 9,000 partook of the luncheons.

A more complete report of the campaign will be made at the May meeting of the Board of Directors

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

THE above grouping of newspaper stories, club bulletins, programs, etc., will give readers some idea of the amount of before and after publicity received on the Indianapolis Canned Foods Week program.

The interest manifested by many readers of this journal in the manner in which the Canned Foods Week publicity program was handled in Indianapolis has led us to secure data directly from headquarters.

More Indianapolis people heard more facts about canned foods and the canning industry in their State than they ever heard before. The Indianapolis newspapers used more space to tell more facts to more Indiana people about canned foods and the commercial importance of the canning industry in the Hoosier State than were ever spread before Indiana citizens before at one time.

Business men gasped when the real importance of the canning industry began to sink in. Indiana people in general began to swell with pride when they realized the quality of Hoosier tomatoes. The newspapers seemed surprised that they hadn't discovered the Hoosier State's canning prominence themselves, and gave liberally of their columns, and the Star made the canning industry the subject of its leading editorial in one issue during the week, and in its Sunday edition published a special article of about two full columns.

William C. Clendenin, of Chicago, advertising counselor and popular business speaker, who has made a number of special investigations on canned foods, spoke before practically every luncheon club in the city of Indianapolis, and as a grand finale appeared by invitation before the graduating class of the Indiana University School of Medicine.

William Clendenin spoke to the Service Club on Monday, Rotary on Tuesday, Lions on Wednesday, the Credit Men on Thursday and the Optimists on Friday. Both Mr. Clendenin and his story received prominent advertising before the meetings in the various club bulletins and plenty of favorable mention afterwards.

Canned Foods is a wonderfully interesting story that can be put over in a remarkably striking way in any city in the country. The way it was put across in Indianapolis should be an example, an incentive and an inspiration to those people in other parts of the country who are interested in this industry. If Frank Langsenkamp can do it in Indianapolis you can do it in your own city.

DIGGING DEEP INTO BUSINESS CONDITIONS

The Story of a New Organization of Several Thousand Railway Shippers Which Knows How to Solve Disputes and Analyze Industry.

(By W. J. L. Banham, General Chairman, Atlantic States Shippers Advisory Board, General Traffic Manager, Otis Elevator Company.)

"How is business?"

The question is put thousands of times every hour, every day, everywhere business men congregate. It may be mere habit to ask it, but the sum total of all the answers affects more people politically, socially and domestically in their day-to-day routine of life than any other question.

Predictions as to the future course of industry are always interesting to the business man. Any facts or figures which are specific enough to help a man project his business plans for a month or six months or a year are invaluable.

Among the welter of assumptions and broad generalities and imaginations which are constantly at hand the practical executive now has the service of one trade analysis which is unique. This is the review of industry made voluntarily by the members of the Atlantic States Shippers Advisory Board, and considered by many business leaders to be the closest check-up of the course of trade which is now obtainable.

Every large shipper and receiver of freight in the Middle Atlantic States is represented on this board. Organized in January, 1924, to adjust informally transportation difficulties with the railways, the board now represents several thousand individual industrial concerns. In other words, practically every shipper of freight in the five States in this territory—New York, Eastern Pennsylvania, New Jersey, Delaware and Maryland—has representation on this board.

There are at the present time eight of these boards throughout the country, covering practically every State.

Out of thirty-eight major disputes which came before the regional boards during 1923 there were thirty-eight settlements between the railroads and the public. Not a single complaint

ROBERT A. SINDALL, *President-Treasurer* HARRY R. STANSBURY, *Vice-President*

was taken to the Interstate Commerce Commission on service matters.

In terms of business analysis and forecast also, the work of the boards is unique. Executives who attended the February and March meetings of the Atlantic States Board, for example, heard reports from fifty-one committees, covering every industry within its district. Each commodity chairman, by a personal canvass of the individual units in his industry, made an estimate of his car demands for a period of thirty, sixty or ninety days based on present and future orders. It is easy to see that through this combined estimate of car needs the Car Service Division of the American Railway Association will be able to allocate freight cars more intelligently in the future and thus avoid congestion and delays.

After a survey of all reports submitted at the Philadelphia meeting of the Board on March 13th, we predict that goods transported during the first six months of 1924 will show an increase of from 10 per cent. to 15 per cent., as compared with the same period of 1923.

Proof of the additional business activity expected this year is already seen in the heavier car loadings. For the first ten weeks of 1924 car loadings were 276,590 cars in excess of the same period a year ago, an average weekly increase of 27,659 cars.

It is inevitable that incidental to such business activity there shall be occasional differences of viewpoint. One of these was settled by the Paper Committee the day before the Philadelphia meeting of the Board. The case had been handed over to the Paper Committee after the two interested parties had attempted for some months to reach an agreement. In a short time the Paper Committee proved that two parties with sharply varied opinions can put their feet under the same conference table and quickly come to a conclusion. Moreover, everybody was satisfied.

This was the first dispute which any committee of the Atlantic States Shippers Advisory Board has been called on to settle. Undoubtedly there will be others. But we believe firmly that the principle of friendly arbitration will be eminently successful.

The fact that the Board has had only one dispute to adjudicate is the more significant considered in the light of the business picture brought out by the commodity reports. Some of the more important specific facts surrounding commodities in various industries, as reported to the Board, follow:

Coffee—The carload shipments of coffee from the port of New York via all the rail lines for March and April, 1923, required approximately 1,430 cars, or about 890 in March and 540 in April. During the whole of last year car requirements at New York were 8,300 empties, in round numbers. During the calendar year 1923 the total importations of green coffee, reduced to tons of 2,000 pounds, were approximately 704,200.

"Due to a change in the current market conditions affecting coffee, impossible to anticipate, we estimate that car requirements for March and April, 1924, will show a decrease of 20 per cent., as compared with the same months a year ago."—Reported by J. L. Carling, chairman Coffee Committee; traffic manager Arbuckle Bros., New York.

Confectionery—Car requirements for the next ninety days will be approximately 50 per cent. less than the preceding ninety days of 1924.—Reported by William R. Moore, chairman committee and traffic manager of the Eastern Manufacturers of Confectionery and Chocolate.

Petroleum and Petroleum Products—A 10 per cent. increase in box cars will be needed for the next sixty days, as compared with the same period of 1923, it was stated by the committee.

"The great bulk of petroleum products is transported in privately owned tank cars. The movement is somewhat seasonal for various commodities requiring different classes of tank cars. The industry has provided sufficient cars of the various required types to take care of the movement if adequate transportation is furnished. The movement at present is generally satisfactory."—Reported by B. C. McPherson, chairman committee, and traffic manager Sun Oil Company, Philadelphia, Pa.

Grain—A large percentage of grain receipts in the next sixty or ninety days will come via the Great Lakes. At present indications are that the terminal markets will get none of the lake movement until after Montreal's facilities are exhausted. The capacity of the North Atlantic seaboard elevators is 17,500,000 bushels, and there are on hand less than 8,000,000 bushels. The car supply and the movement are good.—Reported by Charles J. Austin, chairman committee, and traffic manager New York Produce Exchange.

Coal, Coke and Ore—"At this time there is plenty of car distribution at the bituminous mines and, not only at this time but generally, there is 100 per cent. car distribution in the anthracite fields. Since May of last year this situation has prevailed in anthracite, and, with few exceptions, brought about by unusual conditions over which the railroads have no control, there has been full car distribution in the bituminous field for this region.

"Since the meeting in Florida of the United Mine Workers and the operators from some of the bituminous regions, and the settlement of a wage rate for three years, there has been a slackening of business in the bituminous fields, and the committee feels that spring and summer purchases should be indulged in in order to reduce the winter peak and make distribution throughout the twelve months as nearly as possible on an equal monthly basis.

"While we do not look for any general suspension of mining in the anthracite fields this year, there are always local troubles at various parts of the region, and we believe it is well for those handling anthracite to keep a reasonable amount on hand to carry over any local disturbance which might arise."—Reported by S. B. Crowell, chairman committee, and vice-president George B. Newton Coal Company, Philadelphia, Pa.

Fertilizer—At this particular time the fertilizer movement is almost at its peak and many of the manufacturers are working day and night to get their tonnage out. All of the fertilizer companies advise that they are receiving plenty of cars and excellent service.—Reported by A. J. Whitman, chairman committee, and T. M. Agricultural Chemical Company.

Iron and Steel—The car requirements for the outbound shipments of iron and steel for the next sixty days will be relatively the same as the requirements for 1923. A good car supply was indicated, while the efficiency of the movement was reported as excellent. The cars made empty on inbound business are being applied to outbound loading, so that practically all inbound cars are used for outbound shipments, including coal cars.

"We believe in and practice co-operation. Suggestions for improvement in service-steel interests are making continuous efforts to bring about heavier loading and are showing percentage of increase each year."—Reported by Frank A. Bedford, chairman committee, and division traffic manager, American Bridge Company, Philadelphia, Pa.

Lumber and Forest Products—The lumber business in this territory for the next sixty days will approximate a 10 per cent. increase over a year ago.

"From the standpoint of lumber loading, the excellent and dependable service the carriers have been supplying, the ability of dealers to get lumber through from mills within a few days' time, has had a tendency to straighten out the line and eliminate a lot of the peaks reached during some periods, caused by excessive buying in anticipation of car shortages. As a result of this dependable service it has helped stabilize the lumber industry and the movement should be a steady one throughout the year, with approximately the same total movement of 1923."—Reported by Frank Carnahan, chairman committee and traffic manager, National Retail Lumber Dealers Association.

Milk—"Manufacturers of canned milk in cases, dried milk, malted milk and casein, will require approximately 725 box cars and 295 refrigerator cars for the next sixty days. The above requirements include also some box cars used for the inter-plant shipments of empty tin cans.

"The commodity of principal interest to the ice cream industry consists of inbound shipments of salt. The trade in New York city will require approximately 85 cars during the next sixty days; in Philadelphia 150 cars.

"As to market milk, the industry in New York City is now running on approximately an increase of 8 per cent. over last year, and this may be expected for the next two months; Philadelphia on approximately an increase of 10 per cent. over last year. The market milk end of the industry requires slightly over 500 cans per day."

The condition of the trade in canned milk, dried milk, malted milk and casein was reported as "more or less unsatisfactory, due to a considerable over-stock of manufactured goods. In some lines this situation is showing improvements," said the report, "and the export trade in canned milk is considerably ahead of last year, but on the whole it cannot be said that business is at the present time any better than last year, and the indications are not favorable to any increase during the next sixty days."—Reported by I. Elkin Nathans, chairman committee, and secretary New York Conference Board, Inc.

THE LANDRETH

SPOT OR 1923 CROP SEEDS

We have for spot delivery, a few Alaskas, Green Admirals. These are all short.

Sweet Corn is short. We still have some however. Write us for prices.

We also have the following for spot delivery——

Peas	Okra	Cabbage	Cucumber
Corn	Tomato	Spinach	Snap Beans
Beet	Squash	Pumpkin	Cauliflower

Dwarf Lima Beans

Or any other varieties you may want.

FUTURE OR 1924 CROP SEED

When ready to place your Contract order for delivery after 1924 crop is harvested, write us for prices.

If we had not grown good seeds, given fair prices and careful attention to business, we would not be the oldest Seed House in America, as this is our 139th year in the business.

D. LANDRETH SEED COMPANY

BRISTOL, PA.

Business Established 1784

140 years in the Seed Business.

Salt—Total car requirements for the next sixty days will be approximately the same as the corresponding period of 1923.—Reported by S. R. Moyer, chairman committee and traffic manager International Salt Company, Inc.

Fresh Fruits and Vegetables—This traffic has increased tremendously, particularly in the last four years, according to V. K. McElheny, chairman of the New York Terminal Sub-committee, who made the report.

"Two railroads bring into New York 64,000 cars of perishables, the peak movement of which is in the fall," said Mr. McElheny. "This traffic centers in one section, the wholesale market.

"The main trouble for the last few years has been with the increase in grapes. In the four months, August, September, October and November, we have approximately nine to ten thousand cars coming to this section, and the peak of the loads from ten to fifteen days, when possibly we will have from 300 to 400 cars per day. By disposing of this particular class of grapes we have solved the problem. We have been in conference on that matter and have wired the Coast the result of our conference and are now awaiting their reply."

Mr. Donald D. Conn, manager Public Relations Section, Car Service Division of the American Railway Association, said that the growing of products without regard to what the markets would absorb was one of the biggest problems which the railways had to contend with. He pointed out that Florida was expected to have a 25 per cent. crop increase this year, and California about a 30 per cent. increase.

"We hope to get the Florida people organized so that they will recognize some of these large contributing economical factors, which have a far-reaching effect on every terminal and section of your territory," Mr. Conn concluded.

WITH THE BROKERS ASSOCIATON

UNDERWRITING AGREEMENTS AND CANNERS' ADVERTISING CAMPAIGN—Those of our members who signed underwriting agreements for the advertising campaign of the National Canners Association in 1919 and 1920 will receive these agreements from the Canners' Washington office in the next few days, if they have not already been mailed. The debts incurred in connection with this advertising program have been liquidated. In this connection it is interesting to recall the following portion of the annual report of the President, Mr. Kroehle, to our convention at Louisville in 1922:

"You will undoubtedly wish to know the disposition to be made of your underwriting agreements. These still remain in the vaults of the banks in Washington as collateral for loans made to the National Canners Association. * * * In the way of a definite report it can be said to you that in our opinion you will never have to pay one penny on those agreements. The liquidation of the National Canners advertising and inspection campaign is steadily proceeding. * * * With the guaranty of the Canning Machinery and Supplies Association, and with the canners themselves paying up their back dues quite well, it is a practical certainty that the underwriting agreements will eventually be returned to you. Please remember that this association signed $200,000 of underwriting agreements, but other underwritings were also signed to the extent of an additional $290,000, making a total of $490,000, a really tremendous sum, none of which, in my opinion, will be called upon either in whole or in part."

That this prophecy has come true will be a source of satisfaction to all members, especially those who signed the agreements. The Canners Association has been diligent in collecting delinquent dues, making this possible.

FERTILIZERS REVOLUTIONIZE APPLE GROWING IIN SOUTHERN OHIO

By the Soil Improvement Committee of the National Fertilizer Association.

THE use of high nitrogenous fertilizers, according to the Ohio Experiment Station, on the hilly lands of Southern Ohio has partially revolutionized the apple growing industry of that section.

While fruit in order to grow and produce vigorously, must have access to liberal supplies of ammonia, phosphoric acid and potash, it is the first mentioned plant food that most often is lacking and needs to be furnished in liberal quantities. The importance of attending to this need properly is indicated by the fact age, the vigor of twig growth, and the formation of that upon ammonia depends the conditions of the folifruit buds.

In the sections of Ohio mentioned the application of ammonia fertilizers has doubled and trebled the yield of fruit. Ordinarily the fertilizer is scattered on the ground under the outer ends of the branches at the rate of three or four ounces for each year of the tree's age.

PENNA'S FOOD AND DRUG BUREAUS COMBINE

A merger of the Bureau of Foods and the Bureau of Chemistry of the Pennsylvania Department of Agriculture has been announced by Secretary F. P. Willits. The new unit is the Bureau of Foods and Chemistry, with James Foust as director and James W. Kellogg as assistant director and chief chemist.

Secretary Willits said his decision to consolidate the work was made after carefully studying the activities and the methods of both Bureaus for more than a year. He expects the merger to bring increased efficiency and economy into the campaign against unlawful sale of misbranded and adulterated food materials in this State.

An Old One Reappears.—Agents of the Pennsylvania Department of Agriculture have found painted fish in Philadelphia sea food markets. John M. McKee, deputy secretary of agriculture, reported white salmon, dipped in coal tar dye to give them a reddish tint, were sold as red salmon.

Robert M. Simmers, general agent of the Bureau of Foods, discovered the fraud and notified the Department's Harrisburg office. It was explained that red salmon brings four times the price of the white fish, which were painted in Chicago and shipped to Philadelphia.

Western shippers were notified the deception must be stopped. Immediate action was taken by James Foust, director of the bureau, to investigate fish markets throughout the States to learn whether there has been widespread distribution of the painted fish. Criminal proceedings will be instituted where the fish are found on sale, he declared.

"Dealers in coal tar dyed fish are cheating the public's pocketbook and injuring public health. The iniquitous practice must be stopped", Foust said.

No. 32 Automatic Strip Feed Press

Although similar to our other Automatic Strip Feed Presses, this particular size is especially adapted to the rapid production of deep drawn metal articles.

Of extra heavy design with chrome nickel crankshaft and solid steel flywheel, the Press is well suited for single or double die operations requiring excessive strain. Large diameter shaft bearings allow ample rigidity and extra long slides maintain a perfect alignment of dies.

The Press is provided with compound change gears for variable cuts and simple adjustments for different lengths of material.

The automatic feeding insures a high uniform output and eliminates the dangerous hand operation.

The Press is equipped with automatic release which immediately stops feeding mechanism when subject to undue strain.

Additional particulars on this press or any other automatic can producing equipment gladly furnished upon request

AN AMERICAN-OWNED CANNING CO. IN LIMA, PERU.

MR. W. N. PEARCE, Secretary to Commercial Attache at Lima, Peru, under date of February 11, 1924, reports to the Department of Commerce on the organization of an American owned canning company in Lima.

The Amazon Industrial Corporation, a company incorporated under the laws of Delaware, has been formed for the purpose of developing industrial enterprises in Peru. The chief promoter and stockholder in this new enterprise is an American citizen, a graduate of one of the leading universities of the United States, who has been in this country studying industrial possibilities for some time. The first undertaking of the company will be the establishment of three canning plants, one in Sayan to can fruits and vegetables, another in Huacho for crab and lobster meat packing, and a third in Urubamba for canning fruits, jams, jellies and marmalades. There will also be a plant placed in operation for the manufacture of tin cans to meet the requirements of the above canning factories. The necessary canning machinery for the equipment of one factory has already been purchased in the United States. The activities of the company will not be confined to the canning industry, but will later include the manufacture of candy, the importation of seeds, insecticides and other chemicals useful in agriculture, spraying apparatus and general agricultural implements.

ORGANIZE AUSTRALIAN FRUIT INDUSTRY

The entire fruit industry of Queensland has now been brought under the control of an act of Parliament for the first time in the history of Australia. According to Trade Commissioner J. W. Sanger, Melbourne, in a report to the Department of Commerce, the Fruit Marketing Organization Act of 1923, by which is established an organization for the marketing of Queensland fruit, consisting of local associations, sectional group committees, and an incorporated committee of direction is now functioning. This committee took over the control on January 1, 1924, of the marketing of all fruits which are now offered for sale, transported by rail or handled at water front. The Committee on Direction has the power under the act to purchase, sell and to exchange, lease and hold land, goods, securities and property. The act is to remain in force for three years. The progress of the organization is likely to be followed with keen interest by growers in other parts of Australia and in New Zealand, as its primary purpose is the development of potential markets both at home and abroad, which is felt can only be accomplished by increased quality of the products.

HAMACHEK IDEAL VINERS

IT is of great importance for a packer to be equipped with Hamachek Ideal Viners. This enables him to get a larger percentage of better quality and increases the pack of the smaller and higher priced siftings. It often prevents bunching of the crop which might result if the packer is obliged to wait until the peas are advanced so that a less efficient viner can satisfactorily thresh them.

Frank Hamachek Kewaunee, Wisconsin

Manufacturer of Viners, Viner Feeders and Chain Adjusters. Machinery Manufacturer Since 1880

NEW YORK CANNERS HOLD SPRING MEETING

THE spring meeting of the Association of New York State Canners was held at the Powers Hotel, Rochester, on March 27th. Over a hundred were present, representing 42 active members of the Association.

President J. D. Fuller, of the Fuller Canneries, South Dayton, presided, and reports were received from the Committee on Legislation, Agricultural Relations and Vegetable Standards. The Committee on Standards has completed the schedules on peas, corn, beans, tomatoes, spinach, pumpkin, squash, beets and succotash, and these will be presented to the Association for adoption at the June meeting in Syracuse.

Resolutions of sympathy were adopted in memory of James H. Taylor, of the Clinton Canning Company, and at the time of his death a director of the Association. Norman J. Griffith, of the Stittville Canning Company, was elected to succeed Mr. Taylor as director.

A Traffic Committee was appointed consisting of R. A. Cobb, Curtice Brothers Company; William W. Martin, New York Canners; L. Meulendyke, W. N. Clark Company; G. A. Burnham, Edgett-Burnham Company, and R. S. Thorne, Geneva Preserving Company.

After a luncheon the meeting resolved itself into a cutting demonstration of red sour pitted cherries, white corn and yellow corn. Henry S. Kilian, of Kilian & Clark; George Zimmer, of Dunne-McCord Company, and Howard Lum, of Smithfield's Pure Food Company, acted as judges.

ITALY TO ENFORCE CAN-MARKING REGULATIONS

ITALIAN regulations requiring the name of the contents and the name of the manufacturer to be permanently affixed to imported canned goods will be enforced July 1, 1924, according to advices by Consul-General Ball Osborne, Genoa, in a report to the Department of Commerce. An ordinance was passed January 1, 1923, requiring the origin and class of goods to be stamped on the tin, soldered on, or affixed in any other manner so long as they are solid and cannot be easily substituted or lost. An extended period was allowed, however, for importers and others interested to conform to the new regulations and this period lapses June 30, 1924.

OFFERS GOOD MARKET FOR FRUITS

MANCHESTER, ENGLAND, is becoming a more important distributing center in the British Isles for American food products, especially fruits, canned and dried foods, and as such it offers greater facilities for the marketing of these products than any other British town except London, says Consul Ross E. Holaday, Manchester, in a report to the Department of Commerce. By means of the direct and regular steamer service from the principal ports of the United States and the Manchester ship canal, exporters in this country are able to bring their products within reach of the industrial and food-consuming population of over 2,500,000. Many canned fruit brokers in Manchester have already established connections with exporters in the United States.

The use of oranges, apples, and other varieties of fruits have been extensively urged in propaganda campaigns during recent months by numerous associations in that district, according to Vice-Consul Charles W. Lewis, Jr. It is felt that there is a good opening in Manchester for grapefruit exporters. American varieties are not on the market, the principal sources of supply being South America, Jamaica and Porto Rico. The sale of grapefruit is not being pushed, however, by the associations, who are endeavoring to increase the consumption of other varieties of fruit. Although the trade at present in grapefruit is not large, the qualities of the fruit are appreciated by those to whom it has been introduced, and dealers are of the opinion that the market places a favorable outlook for increased sales in the future.

CANNED FOODS BOON TO AMERICAN HOUSEWIFE ALSO

THE Senegalese housewife is finding canned foods just as wholesome, healthful and convenient as is the American housewife, according to statistics just received by the Department of Commerce from Consul William J. Yerby, Dakar. Meats and sardines are apparently the favorite canned foods of Senegal's table, 73,861 pounds of meat and 85,069 pounds of sardines being imported last year. The total imports of preserved meats and fish into French West Africa amounted to 266,000 pounds last year.

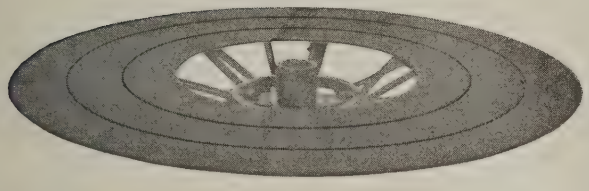
IMPROVEMENT OF CANNING CROPS BY BREEDING.

Summary of the Lecture by F. P. Bussell, Before the New York School for Canners' Field Men.

HIS subject was "The Improvement of Canning Crops by Breeding." He took as type crops sweet corn and garden beans. He mentioned heritable variations as the starting point where selection only was used. This method might be effective where, for example, an early or late type of sweet corn was to be obtained from a variety which exhibited considerable variability in the matter of time of maturity. He instanced also the value of the straight selection method in the case of cabbage in Wisconsin. In that state a strain resistant to yellows was obtained by using seed from selected resistant plants, thereby saving the cabbage growing industry in Wisconsin.

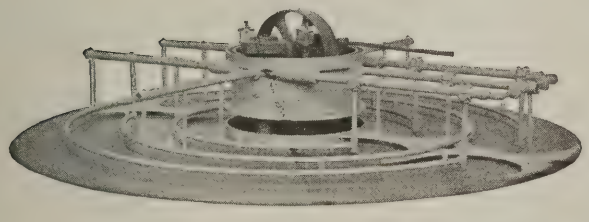
He then discussed the role of hubridization in producing a superior strain of sweet corn where a particular type was desired. By reference to work done at the Nebraska Station he showed how strains might be crossed which differed materially in certain physical characteristics and in time of blooming be fixed for certain desired characters. Applying this to sweet corn, he showed how a particular quality belonging to an early variety might be combined with a later and larger growing type of stalk and ear. In all the discussion he used practical illustrations of actual breeding processes which were applicable to breeding work with the crop in question.

In the case of garden beans, he instanced the use of hybridization in securing strains of garden beans resistant to anthracnose. This disease is often very severe, sometimes causing practical ruin to the crop. All the ordinary varieties of garden beans are susceptible to the disease. By crossing German Black Wax with the Wells' Red Kidney (the latter a field bean) Dr. Emerson has secured six strinless garden types which have the cutinary qualities of the Black Wax, combined with resistance to both strains of the an-



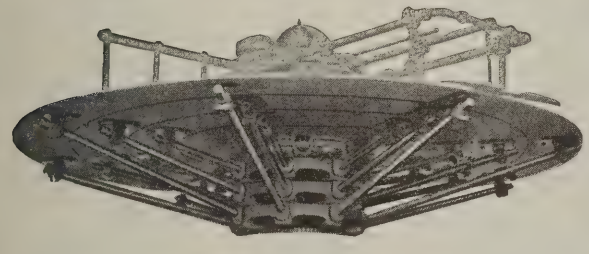
PEERLESS is the Solution of the Exhaust Problem

(Built in Twelve Sizes)



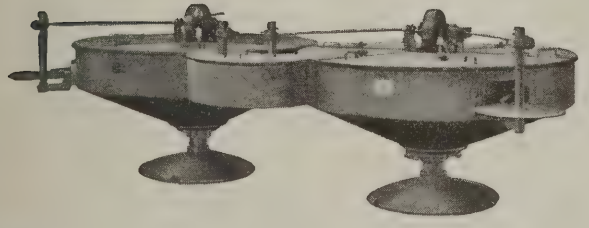
The New Peerless Exhauster

Peerless Exhausters are designed and built to utilize every heat unit in the steam with equal distribution to all cans. Five minutes after starting the unit reaches the high temperature of 211° and holds it steadily.



Transfer Plates are Smooth and Beveled

No jams or spills in the Peerless! How could they occur with these smooth rings? No seams or ribs to catch the cans—absolutely nothing but the metal rings. The cans transfer by friction.



Steam Lines Work with Transfer Plates

These circular pipes shoot steam directly to both sides of the can, thus insuring ample heat with minimum steam consumption. The steam lines act in conjunction with the transfer plates to guide the cans through the exhauster. *You can change sizes in two minutes.*

This Mechanism Drives the Machine

There's nothing here to give trouble. It's absolutely fool-proof. There is *not a single adjustment* on the Peerless and the illustration shows why adjustments are not needed. All gears are machined to gauge and then mounted on the center column.

The Peerless Duplex Exhauster

Solves the problem of long exhausts so that products which are very slow to absorb heat will be really hot when discharged. This type of exhauster thoroughly heats enough cans per minute to keep a line really busy. If even greater capacity is desired the Peerless Exhauster built in Triplex will meet the most extreme requirements.

thracnose fungus. These strains also have the further merit of coming at different seasons, and some are green and some yellow podded. The actual production of these new disease resistant strains is a piece of work which is likely to be of great importance to truck and market gardeners as well as the home grower of garden beans.

After showing how this work had been accomplished by breeding, and also showing actual specimens of the product (seventh generation of the original cross), he discussed the work now under way at the New York State College in using some of this material in crosses with the Refugee and the Refugee Wax types. The Refugee is the canner's bean par excellence, but it is far from being ideal from the standpoint of table quality, and it is not disease resistant. By crossing this bean on some of the new stringless types which carry resistance, it seems that within a few years a resistant stringless Refugee shall be forthcoming. This is prophecy, but there is nothing to indicate that success may not attend the effort, he said.

In summarizing the talk he mentioned that the methods outlined have application to practically all of the crops propagated by seed. A number of questions were asked as the talk proceeded. No attempt was made to cover other crops, as time did not permit; nevertheless, he atempted to show that improvement by breeding is an orderly, definite process. That having determined the end desired, an analysis of the material would show what method was applicable, and that from that point the procedure should be clear cut and definite. He indicated that problems as related to plants, and that with basic canners' crops more attention could profitably be given to careful and painstaking breeding work.

Louis Latzer, Pet Milk Head Dies Suddenly.

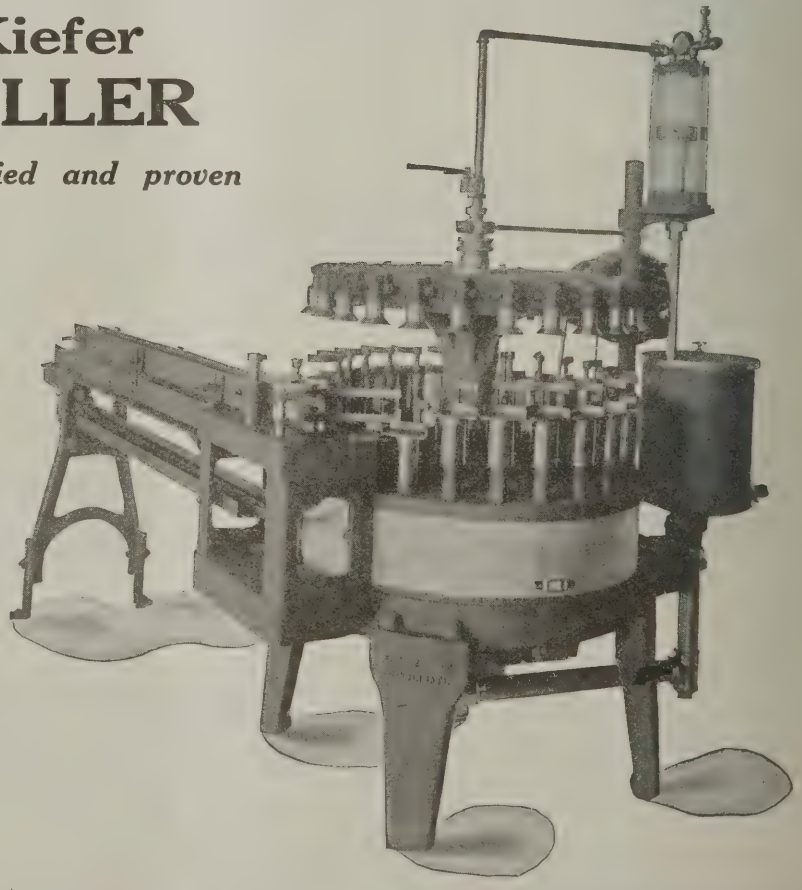
LOUIS LATZER, originator of unsweetened milk, and president of the Pet Milk Company, died suddenly Thursday morning, March 27th, at 9 o'clock, of heart failure, which came without any previous warning whatever. He had been in the best of health, and though 75 years of age was very active in the conduct of the business.

He had been given some warm water to drink by Mrs. Latzer, and, being of a genial disposition, this led him to remark: "Mamma, this reminds me of the story"—and then he died. Wednesday he was in the St. Louis headquarters office, apparently in fine physical condition. He had been much pleased over obtaining control of the Wildi stock and thus bringing about settlement of that controversy.

He made his home in Highland, Ill., where the Helvetia Milk Condensing Company was originally started in a small way and where one of its many plants is located. His death is a blow to his associates, many of whom have been with the company for many years.

The deceased leaves a widow, four daughters, one of whom is the wife of M. C. Gamble, in charge of the St. Louis sales division, and two sons, Robert

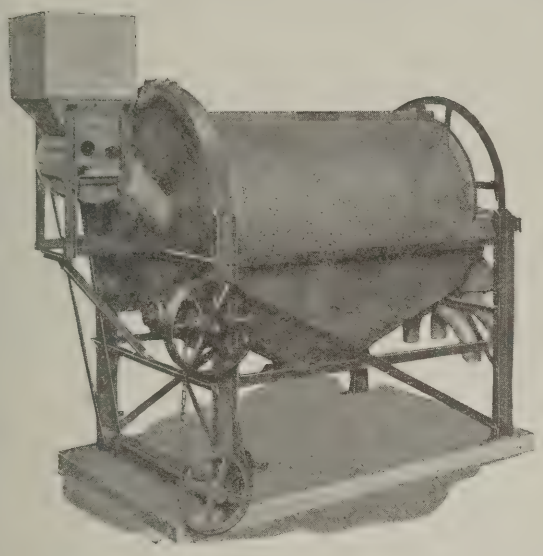
The New Kiefer CATSUP FILLER



This machine is a tested, tried and proven success.

What would it mean to you to have a catsup filler in your plant next season that fills without slop or waste and will not fill broken bottles? No other catsup filler operates on this principle.

Nothing to take apart when cleaning at the end of the day's run. Minimum amount of metal contact. No perceptible loss of temperature when filling.



These are just a few of the important, time, labor and product saving features of this machine.

Can you afford to overlook them? A number of catsup bottlers have already decided they can not, and will install this machine this season.

The Karl Kiefer Machine Co.
Cincinnati, Ohio.

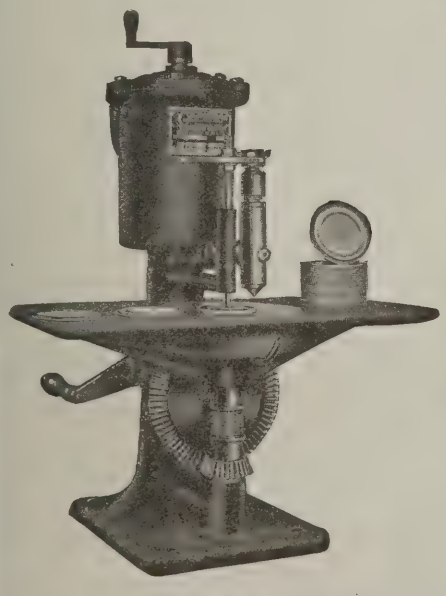
The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

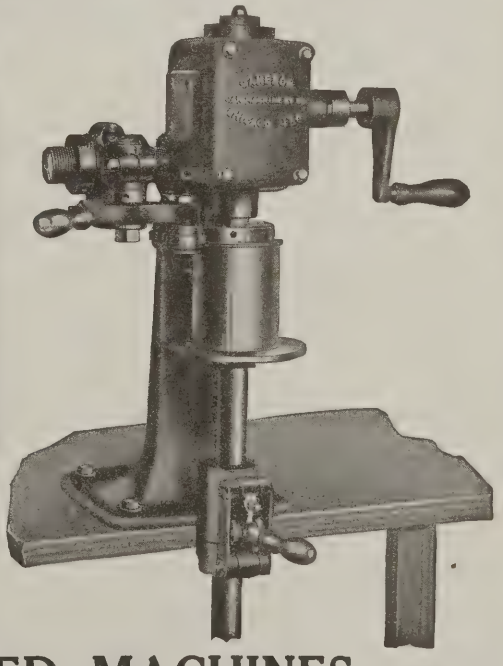
It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.



For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by



Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

CAMERON HAND OPERATED MACHINES

This double-seamer attaches bottoms to can bodies and covers to filled cans. The Compound Applier spreads the rubber cement on the edges of the can ends. These machines are suitable for cans from 2" to 6" in diameter and up to 9" high.

CAMERON CAN MACHINERY CO. 240 N. Ashland St., Chicago, U. S. A.

23

L. and John A., both of whom are active in the Pet business. The other daughters are Miss Alice, Miss Lenore and Mrs. Jennie M. Kaeser.

Mr. Latzer was born on a farm in Illinois and when grown became a farmer on 80 acres, later increasing his land holdings, and became a very successful farmer. In 1885 he assisted in the formation of the then Helvetia Milk Condensing Company and became its president three years later. The company had a hard struggle at first to introduce canned milk.

N. C. A. SECTIONS TO MEET WITH WESTERN CANNERS AT CHICAGO

IN connection with the spring meeting of the Western Canners Association there will be important meetings of several of the sections of the National Canners Association. Those scheduled to date are the Ketchup Section, Tuesday morning, April 22, Wade L. Street chairman; the Pea Section, Tuesday afternoon, April 22, F. A. Stare chairman, and the Corn Section, Wednesday morning, April 23, E. B. Cosgrove, chairman. All sections will take place at the Hotel Sherman.

Of interest to members in connection with the Western Canners meeting will be the fact that President Clark will address the general session on Wednesday afternoon.

TRADE-MARKS DEPARTMENTS.

Conducted by National Trade-Mark Company,

Washington, D. C.

The following are trade-mark applications pertinent to our field pending in the United States Patent Office which have been passed for publication and are in line for early registration unless opposition is filed promptly. For further information address National Trade-Mark Company, Barrister Building, Washington, D. C., trade-mark specialists.

As an additional service feature to its readers, this journal gladly offers to them an advance search free of charge on any mark they may contemplate adopting or registering. You may communicate with the Editor of this department, or send your inquiry direct to the National Trade-Mark Company, stating that you are a reader of his journal.

N. P. C.—No. 181851. Nielsen Packing Co., San Francisco, Cal. For canned fruits and vegetables.

Do You Know

— that PROTEXU CANNERS APRONS will save you money because they are **low in price, unusually durable,** and afford **greater protection** for your employes?

Scientifically constructed of fine, strong fabric, amply coated with tough, elastic, **wear-proof rubber,** Protexu Aprons are especially designed for all canning operations. Hundreds of canners use them exclusively, finding them **most economical.**

Moreover, Protexu aprons are **soft, flexible, lightweight** and extremely **comfortable** to wear. Made in any standard or special size, with or without bib.

COLORS: Black or White
30" x 38 — $12.00 dozen
38" x 44" — $15.00 dozen

Send trial order TODAY — and learn how much apron service you can buy for your money. **Maximum protection** at **minimum expense guaranteed.** In ordering, please mention style and size desired. Samples of fabric, showing quality, on request.

BEAR BRAND APRONS, another popular style (grey), **large** in size, and weighing only **16 ounces,** costs **$12.50 dozen.**

William M. Gross.

Makers of all styles aprons for all industrial purposes

The Markets

BALTIMORE, APRIL 7, 1924

WEEKLY REVIEW

Crops and Their Prospects the All-Important Consideration Now—The Season Coming on Nicely—The California Situation—String Beans to Be More Largely Packed—Market Stands as It Has Been.

PLEASANT PROSPECTS—One ventures upon thin ice in attempting to comment, at this time of the year, upon the possible outcome of canners' crops for the oncoming year, and yet that is the all-important consideration as we write. The canners have been selling themselves into bondage in pledging themselves to deliver canned foods which must be packed from the crops, the seed of which has yet to be sown. This is true all down the line, and in both fruit and vegetable crops. Therefore, while the weather is a hackneyed topic and grows more tiresome to us, who have to merely comment upon it, than it should to the canners, who are wholly dependent upon it, the weather must be considered, and considered deliberately and thoroughly.

Generally speaking, we believe the winter has been a quite favorable one in every section, or at least in most sections, for the 1924 crop prospects. California, where canning begins first, is seriously worried over an unusual shortage of water, both as rain and snow. California, as you know, has to get all her water supply between November and May, and this winter has shown a great shortage of the usual supply. The absence of snow in the mountains to feed the irrigation systems in time of need is possibly more serious with them than the actual lack of rains. But recently both of these important factors have been replenished—good rains in the valleys and heavy snows in the mountains making promise of improved crops. It is too late to benefit some of them—peas and spinach, for instance, promise to be short in their crops in California this year. Due to drought, apricots are also short. But it would seem that the recent reports of heavy damage to the peach crops, by both drought and frosts, is not as bad as first indications promised. The coast has a little time to make up a considerable water shortage, and it is hopeful. So far as fruits are concerned, the increased acreage is such as to make the industry feel comparatively easy as to that outcome. In vegetables there may be some troubles appear later in the season.

What is a greater factor in holding down the output of canned foods of all kinds in California and elsewhere along the coast than the weather or crop conditions in that Old Man of the Sea, the bankers. Last year they told the canners they could not add to their capital investment by the buying of new equipment or machinery; that they must sell out their spot holdings, down to clean floors, and then pack only such orders as they had on their books as futures. That is the inside story of California's conservative pack in 1923 in the face of record crop yields. And the same repressive factor is at work this season. Some jobbers have awakened to this condition and placed their orders, others "kid" themselves into hoping the canners will follow their natural inclination and overdo the packs because the crops will be at hand, and that prices will, accordingly, be lower. They ought to know that this is not at all possible with the bankers sitting on the canners' backs. In this instance this banker domination works to the benefit of the industry, and as the same domination will be experienced in other sections of the country—all through the canning industry—jobbers will do well to stop and consider and get their orders in or be prepared to see another well cleaned up year such as we now face with the 1923 packs.

Here in the East, and in the Central West also, the spring has come on gradually, with enough snow and rains, and cold weather to furnish abundant water for the crops about to be planted, and cold enough to hold back the fruit buds so as to avoid the frost dangers. So far this development has been almost ideal and the promise for crops could hardly be better. The pea canners, especially, will need nearly ideal conditions to get out the acreage counted upon, and the ideal growing conditions to get through the size crop they need to meet the insistent, and, what would seem to be almost insatiatable, demands for peas and more peas. The pea canners can at least sit back and say the world is turning to them and will take all they can produce—if the pea canners will only be true to their calling and to these very good friends, and give them the kind of peas they expect. Quality. The pea canners are the cynosure of all eyes in the canning industry, and they must behave well this year or fall from their lofty pinnacle. They will be taxed to their capacity if the crop is good, and they, therefore, have their work cut out for themselves. Can they do it? They can, and you bet they will.

STRING BEANS—It begins to look as if there would have to be a very considerable acreage of string beans in 1924 if the wants of the number of canners going into this branch of the business are to be met. Present string bean canners should know that there will be a very considerable addition to their number this season; that if present plans carry through there will be a very considerable in crease in the number of cases of string beans canned over any previous season. And if they cannot deduct from this the absolute need of very careful packing so that their goods will rate high in quality, then they are blind, to say the least. Now will come the gum-shoe artist and ask us to soft-pedal such information, that it might break the market, etc. Forewarned is forearmed, and you had better know what you are doing, with your eyes wide open, than to wake up after the deluge. If the weather is right and the crop comes through there will be a big pack of string beans in 1924, according to present indications. And if they are packed rightly—not like a can we had on our table recently, with strings like cat-gut—the market will take them all at a good price. Otherwise, look out for this market.

TOMATOES—The tomato canners are working well with their growers, and in all sections better plants from better seed, will be set out, and a better product will result. Growers' ideas of prices may hold down the acreage somewhat, but not much. The better yields are making tomato growing more attractive, and this crop is highly regarded by the growers. The "mean average" price over the whole country will be slightly higher than in 1923, we believe. It averaged $13.29 per ton last year, and will probably be $14.00 or a little better in 1924. It is hoped and expected that the improvement work, in the shape of community plant beds, etc., will result in a generally improved quality. In this Tri-State region the quality of the raw stock tomatoes was higher in 1923 than ever before, and the drive now is to improve on that improvement. If we could only induce all tomato canners to show a like improvement in the quality of their fill we believe the tomato problem would be solved for all time. The least any tomato canner can do is to fill his cans with tomatoes, the cheapest item in the cost of this product, and the one thing which will permanently win an increase of consumers, and without which the market will sag again.

CORN—The average price paid for canners' corn in 1923 was $12.38 pr ton, and it is thought that this average will not be greatly disturbed, though it may range slightly higher, certainly not lower. A good many corn canners might profitably consider reducing their acreage and improving their quality in the can. You can't improve the quality upon an increased acreage, as a rule, if the crop is good, unless you have vastly incresed your facilities. Better to play the game the other way because the present factory capacity on corn is above the market requirements, if the acreage is put out and the crop results. And this would seem to be the determination.

THE MARKET—Just "ditto" last week's reports; steady buying, in small lots of both spots and futures, coming from a wide section, and keeping the prices firm with promise of improvement, rather than decline.

NEW YORK MARKET

Steady Demand for Spots—Wholesale and Retail Holdings Low—Only Rumors as to Lower Prices on Southern Future Tomatoes—Wide Difference Between Tri-States and Western Future Tomato Prices—Corn Is Quiet—Spinach Strong—Northwestern Berries Offered.

New York, April 3, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

THE Market—There has been no letup in the demand for spots during the past week, and while demand is mainly for small quantities, stocks are likewise small. In the opinion of well-posted market observers, the outlook indicates a bare market on many staple canned foods commodities by the time the packers are ready to start shipments on 1924 packing. The stocks of both wholesale and retail grocers are low on many items, and the trade will just about be able to get through to the new canning season.

Tomatoes—While there have been some rumors of price cutting on future Southern tomatoes, there has been no break in the general basis. The prices quoted are really too low, if reports from other canning sections may be credited. California is having crop trouble on practically all items, and it is conceivable that the tomato pack may be affected. The California Packing Corporation has advanced tomatoes on some sizes, and their price basis for spot shipment is as follows: Standards, 1s, 80 cents; 2s, 95 cents; 2½s, $1.20; 10s, $4.00; solid pack, 1s, $1.00; 2s, $1.25; 2½s, $1.60, and 10s, $5.15. Indiana tomato packers are well sold up on futures, and practically cleared on spots. On futures Indiana packers quote standards at $1.00 for 2s, $1.40 for 3s, and $4.75 for 10s. With this wide differential from the future prices of Maryland and Delaware canners it is probable that the Southern packers will soon be getting some of the business which normally goes to the Mid-West canners. Everything appears to justify an advancing market, and the canner who resorts to price cutting at this stage of the game just to get orders for a car or two on his books seems to be playing a losing game.

Corn Quiet—There has been a quiet movement in standard corn during the past week, and the market remains about unchanged. A few lots of fancy Maine corn have appeared on the market for factory shipment, fancy Golden Bantam being quoted as high as $2.25 per dozen, f. o. b. cannery.

California Pack Outlook—Continued reports of crop damage in California are received, and it has been variously estimated that the fruit pack will suffer a drop of 20 to 30 per cent from the 1923 production. Peaches, it is reported, have been seriously damaged.

Spinach Strong—California spinach is strong and in small supply from the new pack, and it is reported that buyers were not fully covered on their requirements before many of the Coast packers withdrew. This would make for a better demand and stronger market on Southern pack.

Enters Brokerage Field—C. A. Haldt, former manager of the New York office of Thomas Roberts & Co., Inc., has entered the brokerage field here. He will specialize in Southern canned foods and fresh fruits and vegetables. He is making a trip among Delaware and Maryland canners this week to line up accounts for his new business.

Offer Northwestern Berries—Opening prices on Northwestern berries have been named by several factors. The prices are slightly higher than those for 1923 in most instances, the differences being due to higher costs of sugar, tins, boxes, labels, etc. A fair advance business has been booked, it is said.

Retailers Buying—Retail grocers are responding to the talk of damage to California fruits, and there has been an increased buying movement noted during the past week. Retail grocers have noted a steady advance in the general canned foods price basis during the past several months, and have about come to the conclusion that the present is a good time to buy. Hawaiian pineapple has received a little more attention, and there are fewer weak spots on this item.

Peas Strong—Stocks of peas, particularly the larger siftings, are small, and the market is strongly held. Buyers are shopping the market constantly in an effort to bring to light wanted grades, but quantities available, even in the resale market, are extremely limited.

Salmon Quiet—A quiet market for salmon has prevailed during the week. Bottom on pinks is $1.35, with reds held at $2.30 to $2.35, ex-warehouse New York. Spring buying has not yet gotten under way on salmon.

Killian Hopeful—A local paper carries a short article by William H. Killian, president of the Canned Goods Exchange, of Batimore, on the outlook for the coming canning season. In part Mr. Killian says: "Canners seem to be preparing for the 1924 season with more confidence than for some years. Buyers also seem to share in this confidence, as shown by their disposition to place future orders in much larger volume than has been the rule. It may be safely assumed that neither is actuated by speculative desire. Both have enjoyed a more stable business with a moderate, yet dependable, profit, unhampered by a fluctuating market. In fact, the canned foods market has been more firm and steady through the winter of 1923-24 than usual. Preparations for an increased pack lie mainly in the direction of added equipment, to which the canner is impelled by a constantly decreasing supply of common labor. Altogether the situation may be said to be promising for better business methods. Experience has taught all the need for better ethics, better quality and more stability, and this will encourage more confidence between buyer and seller, a condition altogether helpful and desired."

Personal Trade Notes—C. C. Ballard, grapefruit canner, of Clearwater, Fla., was here during the week, visiting Warmington, Timms & Co.

Harold Durney, of the Griffith-Durney Co., San Francisco, is visiting the trade here.

W. D. Breaker, president of W. D. Breaker & Co., Inc., returned this week from a visit to the Pacific Coast.

North & Dalzell have been appointed New York sales representatives for Frazer & Co.'s line of canned Japanese crabmeat.

Harold Deshon, sales manager of the Smithfields Pure Food Co., of Rochester, N. Y., has returned to Rochester after a brief visit here.

Robert L. Craig, of the Craig Brokerage Co., of Indianapolis, was visiting friends in the trade here during the week.

Bacon & Trubenbach, Inc., have been appointed brokers here for George H. Hunter & Son, of Westminster, Md., and the Lineboro Canning Co., of Lineboro and Manchester, Md.

Angus Holmes, of the Stockton Canning Co., sardine canners, of Stockton, Me., was here during the week.

Fred B. Neuhoff, broker and canner of Los Angeles, is visiting friends in the local market.

G. E. Finch, of the Edgett-Burnham Co., of Newark, N. Y., was here early in the week, stopping with North & Dalzell.

CHICAGO MARKET

Market Showing More Life—Paying 95c for Corn on Steady Buying—Buying Southern Tomatoes—Salmon Improving—Futures Selling Slowly—Coast Packers Will Clean Out Spots and Pack Futures in Their Boxes.

By "Wrangler,"
Special Correspondent "The Canning Trade."

MORE LIFE—The Chicago market for canned foods is a little livelier than at my last report. The wholesale grocers are buying canned corn pretty regularly, and are paying 95c cannery for it. I have heard of no salaries closed at a higher price this week for standard quality.

The buying of tomatoes is practically confined to Maryland and Delaware, and our wholesalers are buying ones at 65c, twos at 95c, and a few threes at $1.30 f. o. b. canneries. Some orders went forward by wire to Virginia canners for twos standard spot tomatoes this week, so I learn, at 92 1-2, but arrived there after the goods were sold elsewhere.

There has been some buying of California canned fruits this week, especially in canned peaches and apricots. The buying was induced by reports of crop injury and early frosts, drought, etc., but later reports by wire to the effect that good rains had come to the drought threatened districts seem to have slowed down the buying and to have discouraged speculative buying.

Canned salmon is speeding up a little with the approach of spring, and I have heard of a number of sales this week of pooled cars, but of on heavy buying. There are some stocks of canned salmon held for canners' consignment account in warehouses here, and most of the buying for sometime past has been in small lots from such stocks.

Canned apples seem to be getting on better slowly. An offering was on the market this week of standard No. 10 from a New York state cannery at $3.00 cannery that state. Michigan has but a very few small lots left, I hear, and is holding them firm at $3.25 cannery.

Futures are selling slowly but steadily in canned corn, peas and tomatoes. The salmon canners and canners of fruits on the Pacific Coast have not yet named future prices, and are not inviting S. A. P. busness, therefore contracts are rather a rarity.

I understand that the policy of both the salmon canners and the California fruit canners is to sell all their spot holdings down pretty close before urging future sales, for they feel, and probably know, that the pushing of futures always has the effect of lowering, or at least of weakening, the prices of spot goods. Sales of goods at S. A.P. terms or firm at opening price terms, the canners have come to believe, amount to nothing, as one way gives the buyers an option and the other way gives the canner an option, and neither way is acceptable, and both ways usually bring about misunderstandings and rows between contracting parties.

The weather has been snowy, but not cold, and shipping of canned foods has been safe for ten days, and there has been no congestion or accumulation of orders. News is rather scarce this week.

ST. LOUIS MARKET

Trading Continues in Fair Amount—Only Absolute Needs Being Covered—Small Blocks of Tomatoes Being Taken—Indiana Future Tomato Prices—Peas Strong—Corn Quiet—Future Prices—Fruit in Better Demand—A Jobber's View.

St. Louis, Apri 13, 1924.
By "Missourian,"
Special Correspondent "The Canning Trade."

THE Market—There has been but little change in the canned foods situation during the past week. Trading locally continues in fair volume. Prices well maintained. That values of 1923 packs of canned foods of all kinds are somewhat less than the 1924 packs will be has bettered spot trading. Because many lines of stocks are broken in assortments, makes the general situation stronger and more interesting. There is an active demand for quick shipment. Carload lot purchesers are not much in evidence. There is but little interest shown in future packs. This puzzles the canners as well as the brokers. Distributors have been buying on a hand to mouth basis for quite a while and are not inclined to change their policy. They know what they have on hand and what they are short of, and they replensh the latter from time to time, but only for what they actually need. Because distributors are not inclined to accumulate stocks causes price irregularties.

Tomatoes—There is only a moderate call for spot tomatoes. There are more calls for small blocks than for carload lots. Jobbers are not oversupplied with smaller sizes, and when buying it is only for replenishment, and not for future use. No. 2s and No. 3s are steady at factory prices. Prices on California No. 2 1-2s are irregular. Gallons are not much in request, consequently there is a weakness shown. When country and summer resorts open and begin to buy, it is believed there will be advances. California as well as Southern are quiet. There is little call for futures. Prices quoted: No. 2 standard, f. o. b. Indiana, $1.15; No. 3 standard, f. o. b. Indiana, $1.60, and No. 10 standard, f. o. b. Indiana, $5.45.

Peas—There is a great scarcity in offerings of peas. Jobbers are being forced because of the shortage to go on the open market most of the time and compete with each other on all grades. The result is that the market is strong, and prices are forced up. Most of the trading is on resales. When they can be found futures, especially early deliveries, are taken, but the majority of the canners, no matter where located, have booked up about as much business as they believe they care to take, and won't make further contracts. This gives the packer the advantage, and he insists on assortments and full prices.

Corn—The market on corn is quiet. There is no surplus of spot standard and no free sellers. Full prices are demanded. tone. Futures, fancy packs, have been well taken, and most of Fancy corn is so sparingly offered that there is a strong under the early bookings have been done. A fair volume of standards have been booked. Prices quoted f. o. b. are: No. 2 Fancy Crosby, Minn., $1.35; No. 2 Golden Bantam, Minn.. $2.00; No. 2 Standard Evergreen, Wisconsin, $1.00; No. 2 ex-Standard Evergreen, Wisconsin, $1.05; No. 2 Standard, Illinois, 95c; No 2 Standard, Iowa, 95c; No. 2 Standard, Indiana. 95c; No. 2 ex-Standard Country Gentleman, Ind., $1.20; No. 2 Fancy Country Gentleman, Ind., $1.30; No. 2 Standard, Ohio, 95c.

Miscellaneous—Spot spinach is affected because of the tendency to higher prices in the South and California. String beans are hard to find, since offerings have been restricted. Succotash is almost out.

Fruits—While not big sellers, California peaches are advancing in price. Sales of seconds and standards have cleaned up those grades closer than in several years, and the outlook is for a stronger market with the advance of the season. There is no large supply of choice and fancy lines on the coast and no free sellers. Not much interest is being taken in the new packs. The outlook for apricots is brighter than it was. It is likely that opening prices will be higher, as canners state it will cost more money to can than formerly. There is an improvement in pineapple. Apples are still quiet, as the spring demand has not started.

Missouri is becoming a more important shipper of commercial apples each year, according to a report issued by the State Board of Agriculture, which said that in 1923 there were 3,497 carloads of apples shipped from railroad stations in the state, compared with 2,677 carloads shipped in 1922.

C. H. Schlapp, of the Krenning-Schlapp Grocer Co., commenting on the canned foods situation, stated that business for the first two months of the year shows a slight increase over the same period of 1923. The outlook for the next four or five months is good. There are no conditions which will be effective in retarding busness. Canned foods week brought about a heavy increase in the sale of canned foods, the popularity of which is growing constantly. Stocks in packers' hands are below the average at this time of the year, and costs of new packing are higher for the 1924 season than they were in 1923, so that an advancing market is expected in spot canned foods and the trend of the market in the fall will depend largely upon the size of this year's pack, which naturally is influenced by all kinds of climatic and other conditions.

CALIFORNIA MARKET

Heavy Rains Relieve the Drought—Crops No Longer Suffering —Scare Stories About Frost Damage—Damage Not as Great as Early Reported—Apricots Short—Demand Increased Because of Adverse Reports—Future Tomato Prices Are Named—Loose Talk About Pineapple.

San Francisco, April 3, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

HEAVY Rains—The drought which has held California in its grip for months, and which has done much damage to crops, particularly to those which mature early, has been definitely broken. During the last week of March heavy rains fell in the San Joaquin Valley and in the southern part of the State, with snow in the high mountains, relieving the situation very materially. Of course, the precipitation to date is much below normal, being, in fact, only about one-half the average in most places, but crops are no longer suffering.

With the drought off their minds, growers and packers are now commencing to worry about frost damage, cold weather having followed the recent storm. Scare stories are coming out of the leading fruit-growing districts and are being given wide circulation in the daily press. Officials of various fruit-growing organizations are reporting very heavy losses, but Government officials suggest that these are much overdrawn. That there has been some damage done in Sutter, Yuba, Butte and Sacramento counties is generally acknowledged, but no evidence has been produced so far that will lead one to believe that 80 per cent of the peach crop has been destroyed, as press reports have indicated. Automatic reports indicate that no damage has been done in many places, and that a fair fruit crop is promised at this date. There is never a year but that reports go out about this time of heavy losses by frost, but it is rarely ever the case that the damage from this source is general.

Apricots—That California will have a short crop of apricots is the general opinion of growers and canners alike. This was expected, following the heavy crop of last year. The California Prune and Apricot Growers' Association recently issued a statement on this subject, as follows: "Apricot trees bloom and set their fruit two to three weeks earlier than do prune trees, and, consequently, we can give fairly reliable information. Our estimates indicate not more than 50 per cent of a normal crop. At many points where the bloom was good, the fruit failed to set satisfactorily, some frost damage has already been sustained, and all districts naturally report unsatisfactory moisture conditions. The pack of canned apricots last season was only 1,000,000 cases, against a normal of 3,500,000. Generally speaking, the pack was disposed of long ago, and as canners are already in the field offering nearly three times what they paid last year, it seems that they contemplate a materially increased pack for the coming season. All in all, as we see it, there is only one prediction to make concerning the 1924 output of dried apricots, namely, they will be scarce and high."

This statement comes from an organization interested, as will be noted, in dried apricots. The reference to crop prospects is as nearly accurate as any that might be made at this time, but the pack figures were rather loosely quoted. The apricot pack for California in 1923 was 1,562,298 cases, and the normal is well below 3,500,000 cases. Canners are in the field seeking fruit contracts, but there are few offerings more than $40 a ton for fruit, with $30 coming closer to what they feel is the proper figure. All agree, however, that last year's prices were too low.

Demand—The demand for California canned products of almost all kinds has been stimulated of late by adverse weather conditions and by the growing shortage in stocks. There is still plenty of canned fruit to go around, but prices are firm and advances may be expected on some lines. Peaches are in heaviest supply, but there is a general feeling of confidence that stocks will be moved out before the new pack is ready. Vegetables of the new pack are attracting marked attention, and some lines are about sold up. Many packers have booked all the orders they care to on asparagus, and the expected pack of peas has been sold. The drought greatly cut down the output of spinach, and several packers have advanced prices. The prevailing prices are now $1.10 on No. 1s, $1.30 on No. 2s, $1.60 on No. 2½s and $5 on No. 10s.

Tomatoes—At least one California packer has quoted definite prices on 1924 tomatoes, and others are expected to launch an active drive for business shortly. Walter M. Field & Co. is offering the pack of the Bay Side Canning Co. as follows:

No. 2½ Standard, with puree	$1.10
No. 2½ Extra Standard	1.30
No. 2½ Solid Pack	1.45
No. 1 Standard, with puree	.75
No. 1 Solid Pack	.95
No. 2 Standard, with puree	.90
No. 2 Solid Pack	1.10
No. 10 Standard, with puree	3.40
No. 10 Extra Standard	4.00
No. 10 Solid Pack	4.75

Pineapple—Considerable loose talk has been going the rounds of the wholesale trade of late regarding surplus stocks of Hawaiian canned pineapple. It has been suggested that all interests have more canned pineapple on hand than should be the case, and that efforts to move stocks have not been entirely successful. Much of this talk is not founded on facts, and men who understand the pineapple business from A to Z state that those who are not able to move pineapple have only themselves to blame for it. As far as packers are concerned, there are no surplus holdings. One of the largest operators has sold up so closely that no efforts are being made to keep up a spot list for the trade, and no efforts are being made to move stocks on hand. The entire holdings, made up largely of odds and ends, do not amount to as much as many an individual order in season. This firm will move everything in hand long before the active packing season. The winter pack was disappointing and is scarcely to be regarded as a factor. Reports made last fall of the probability of an increased pack in 1924 do not promise to be fulfilled. Growing conditions have not been of the best, and the outlook now is for a pack about equal that of 1923. A considerable quantity of sliced pineapple has been crushed this pring in an effort to take care of the demand for the crushed article, removing quite a quantity of sliced goods from the market.

The European demand for Hawaiian canned pineapple has been quite marked of late, and is expected to be much heavier in 1924 than it was in 1923. One large concern booked 25 per cent as much business during the first three months of the present year for export to Europe as during the whole of the past year, and its European representative advises it to reserve 50 per cent more than in 1923.

The attitude of both the wholesale and retail trade toward Hawaiian canned pineapple is much like that of a spoiled child. For several years they have been making unwarranted profits on this fruit, profits they have not expected on other lines carried, and have been instrumental in placing it in the luxury class. Speculators have bought it and made large profits. Wholesalers have tacked on profits not secured on other canned fruits, and retailers have taken all that the consuming trade would bear. This year conditions were such that speculators who managed to secure stocks could not turn them at the expected premium, and wholesalers were unable to get their customary heavy margin. Pineapple has gone into the staple class, where it belongs, but many are still handling it on a luxury basis. Wholesalers willing to handle it on the same basis as other commodities and willing to put some sales effort behind it have sold their early purchases and have reordered.

Just another word concerning pineapple. The belief seems widespread that the pineapple business in Hawaii has been one of uniform success and large profits. Many people are familiar with the success of the Hawaiian Pineapple Co., Ltd., and comment upon this freely, but ignore the many and heavy losses that have been sustained in the development of the industry in Hawaii. The results obtained by the company mentioned are frequently quoted by promoters seeking to interest investors in pineapple ventures in South Africa, Samoa, Fiji, and other places. As a matter of fact, the rate of business mortality has been just as heavy among concerns engaged in the growing and canning of pineapple as in other lines. Last year conditions favored packers, and it is believed that for the first time in the history of the industry every pineapple-canning concern in the territory made a profit. However, there are 13 pineapple-canning concerns in the Hawaiian Islands, one investigator points out, and only three or four of these are paying dividends.

MAINE MARKET

Weather Holding Business Back—Future Selling Slows Up as Canners Close Books—Clams Are Busy—A Clam Cannery Is an Attractive Place—Troubles Are Threatened for Sardine Canners.

Portland, Me., April 4, 1924.

By "Maine,"
Special Correspondent "The Canning Trade."

DELATED March weather is retarding the general opening of spring and spring business. Cold and blustery for the past week, with no immediate promise of the warm rains and hot sun necessary to bring the frost from the ground and give earnest of a proper seed time.

Future sales have slowed up a bit, but the various packs are now so nearly sold up that this condition is quite satisfactory to the canners just now. Future corn has had an exceptionally good demand and still holds firm in price at $1.45 for Crosby and $1.75 for Golden Bantam.

Stringless beans have also sold well and are now practically all taken up, at least until the season is further advanced. Beans have held at the opening price of $1.30 and $6.00 for the No. 2 and No. 10 sizes.

One of the busy lines just now is clams. The fishermen have brought in such small fares that canners were once obliged to stop selling, but this has improved during the past week, and the volume is again nearly normal. On the strength of this improvement orders are once more being accepted. New goods are going to market as fast as produced. 5-oz. clams are still worth $1.30.

It was the writer's privilege today to visit a clam-canning factory during operation—wish we might all see it, as the whole procedure and process is very interesting, without any of the unpleasant features usually associated with the handling of fish products. The factory is located in a small country town, with local operatives of our oldest New England stock. From the time the clams are unloaded from boats, in neat bushel baskets, all during the work of steaming, "shucking," washing, trimming and filling, right up to the closing machine, every step is clean, sanitary and wholesome.

The advent of the sardine season has received official notice. The union boatmen and union weirmen have opened an argument as to the duties and privileges of each branch; it is even possible that they may be able to effect a strike or tie-up to add to the present troubles of the sardine canners.

New money is said to be negotiating for the purchase of two large plants of the Seacoast Canning Co. at Lubec.

SEATTLE MARKET

Salmon Operations to Be Restricted—Canners Oppose Senate Bill—Sections of the Proposed Law That Are Hurtful—Red Salmon Pack Will Be Cut If the Bill Becomes a Law—Prices on Future Berries.

By "Nomlas"
Special Correspondent "The Canning Trade"

CANNERY Restrictions—Further restrictions of the operations of Alaska salmon canners are anticipated as a result of the action of the House Committee on Merchant Marine and Fisheries in Washington in agreeing to the passage of the Alaska Salmon Conservation Bill. The bill provides that for the purpose of protecting and conserving the fisheries of the United States in all Alaskan waters, the Secretary of Commerce from time to time may set apart and reserve fishing areas in any part of the waters of Alaska over which this country has jurisdiction, and within such areas may establish closed seasons during which fishing may be limited or entirely prohibited upon his order. Under this authority to limit fishing in any area so set apart and reserved, the Secretary of Commerce may fix the size and character of nets, boats, traps and other gear and appliances to be used therein, limit the catch of fish to be taken from any area, and make any regulations as to time, means, methods and extent of fishing as he may deem advisable. Every such regulation shall be of general application, and no exclusive or several right of fishery may be granted in the territories affected.

Canners Opposed Bill—Salmon canners opposed the bill, and succeeded in eliminating some of the drastic provisions which Delegate Sutherland, of Alaska, who has been fighting the cannery interest, sought to have written into the bill.

Provisions of the Bill—Among the most important provisions of the bill are one making it unlawful to set any nets, traps or other fishing apparatus across any stream, estuaries or lagoons for a greater distance than one-third of the width thereof, or within 100 yards outside of the mouth of any red-salmon streams where the same is less than 500 feet in width; a section extending the provisions of the existing laws which establish a closed time from 6 o'clock postmeridian of Saturday to 6 o'clock postmeridian of the Monday following to all the waters of Alaska, and also giving authority to further extend such closed time, and a section increasing penalties and providing for the forfeiture of boats, traps and other appliances used in violation of the bill or of the 1906 act and of all fish taken therein.

Will Cut Red Pack—It is held here that the extension of Government restrictions will materially cut the pack of red salmon during the coming and following seasons. Salmon canners have been the targets for considerable unfavorable legislation and attempted legislation during the past several years, both from Washington and from the Alaska territorial government.

Offer Future Berries—Opening prices on the complete line of Northwestern berries have been named by several packers, including the California Packing Corporation. The Corporation bases its price on its "Del Monte" 2½s, as follows: Loganberries, $3.25; gooseberries, No. 2s, $2.85; black raspberries, No. 2s, $2.85; red raspberries, No. 2s, $3.10; strawberries, No. 2s, $3.10. Prices are f. o. b. For water shipment, prices are 2½ cents per dozen higher on No. 1 and No. 2, 5 cents higher on 2½s, and 15 cents higher on 10s, bringing the goods f. o. b. dock Portland.

The above prices apply on Oregon and Washington pack. On California blackberries, 2s, Del Montes are quoted at $2.20.

Salmon Quiet—Salmon trade has been routine during the past week, chums still being available in a small way at $1.20, with pinks holding at $1.25 and reds at $2.25 to $2.35. Volume continues limited.

IN RE:THERF MEEHAN-COLBERT LETTER

IN our issue of March 24th, under the title "Colbert Calls the Turn This Time," we published a letter from the Colbert Brokerage Co., in which Colbert contended that the quotation by Meehan of 85c on No. 2 future tomatoes was too low, and that the brokers on the Peninsula held 87½c as low. Colbert referred to Meehan's letter as published in The American Grocer.

Under date of April 3rd The American Grocer have written us in part, as follows:

"These prices did not appear just as the Colbert Brokerage Co. claimed in their letter. The prices were taken from Thomas J. Meehan's weekly market letter and quoted the market as follows: No. 2 standard 85 to 87½c; No. 3s $1.25 to $1.27½ f. o. b. Peninsula."

"While the future market may be quoted at the higher figure, we know of sales that were made here (in New York) in good size lots at the lower quotations."

The original article appeared on page 28 of our issue of March 24th, and we published Meehan's letter, referred to, on page 40 of our same issue, and from this it will be seen that The American Grocer is absolutely correct, as is also Meehan. It is just the old story, with which we are all very familiar: The broker urged by some ignorant canner to sell goods below the market, but to sell them, and this the broker does. Meehan would not quote a price which does not exist and we all know that.

Our object in reproducing Colbert's letter was not to criticise Meehan's quotations, but to show Colbert on the other side of the market to which he has been accustomed to be during the past year or so. "Jimmy" said he was going to reform, and this showed practical evidence of it, and we though he deserved the publicity for that reason.

THE GOOD OLD DAYS

The memory test was monopolizing a conversation in Tennessee.

Ah mind me," said one dark-hued citizen, "of de time when de Mississippi River warn't no wider dan de Ohio am now."

"Gwan man. yo' ain' got no memory," interjected a comrade. "Ah minds de time de Mississippi didn't run no furder dan St. Louie."

What Canned Foods Distributors are Doing

Federal Trade Commission Attacks Grocers for Demanding Guarantee Against Price Decline from Manufacturers.—Branding F. O. P. and S. A. P. Contracts "Pernicious" Prune Association Drops Future Selling.—Recent Mergers, Changes, and Activities of Jobbers and Chain Stores.

GUARANTEE against price decline, favored by the great majority of wholesale grocers, has again come under the fire of the Federal Trade Commission, which has charged the Ohio Wholesale Grocers' Association and its members with unfair methods of competition, due to alleged concerted action with regard to guarantee against price decline.

According to the Commission's brief, guarantee against price decline operates to decrease price competition among wholesalers. "When goods are not guaranteed by the manufacturer," says the Commission, "jobbers with depleted stocks have a substantial and legitimate advantage in buying on the decline, as against jobbers with heavy unsold stocks purchased prior to the decline. A guarantee operates to destroy that legitimate advantage and to put both classes on an equal cost basis."

While manufacturers and producers of practically all items sold by wholesale grocers in some manner guarantee their prices against their own decline, this practice has not become general in canned foods.

Canners in naming tentative prices guarantee these prices against their formal price basis, to be named subsequently, but in the general market this practice does not obtain.

Through avoiding the use of the guarantee against decline, canners have steered clear of many difficulties, and have kept their market, perhaps the most open trading market (with the exception of sugar and coffee) doing business with the wholesale grocery trade.

"Pernicious" Contracts—F. O. P. and S. A. P. contracts are termed a "pernicious practice of making future commitments" by the California Prune and Apricot Growers' Association in a current announcement to the trade, announcing that all future selling would be discontinued by it.

F. O. P., or "firm at opening price," contracts attained a wide vogue during the war, but gradually went out of fashion under a steady attack from wholesale grocers all over the country, particularly by the American (then Southern) Wholesale Grocers' Association.

Canners in the East did not use F. O. P. or S. A. P. contracts as widely as they were used in California.

It is believed that the Prune Association is the last of the big selling organizations to drop the F. O. P. form of contract.

The new selling policy of the Prune Association, as outlined by General Manager A. M. Mortensen, is: "It shall be our policy to announce 1924 season's opening prices as soon as it is possible, consistent with a reliable estimate of tonnage and careful consideration of trade, industrial and financial conditions at home and abroad.

"When the opening prices are announced, and not before, we will offer the trade at those prices such proportion of our estimated output as is deemed advisable. The buyer will then have a good idea of his estimated needs; he will be unhampered by any future contracts, and, consequently, can survey our offerings and act as his judgment dictates."

Retail Grocers' Meeting—Six or seven special trains will be made up in the East to make the trip to Los Angeles for the annual convention of the National Association of Retail Grocers, June 15, 16, 17 and 18.

In addition to the record-breaking attendance of retail grocers at the meeting this year, it is expected that a number of manufacturers, canners and wholesale grocers will be the retailers' guests at the convention.

U. S. Buys Two Chain Systems—The United States Stores Corporation has purchased two chain store systems in Pittsburgh—the grocery and meat chain of Huey & Matthews, Inc., and the Cash and Carry Stores, with 156 grocery stores, organized by the S. B. Charters Grocery Co., Inc.

All of the Pittsburgh stock will be concentrated in one warehouse. A modern bakery, with a capacity of 50,000 loaves of bread daily, will supply the bakery requirements of all of the stores.

The United States Stores Corporation now operates 767 retail grocery stores, with gross annual sales estimated at $25,000,000.

To Change Association Constitution—M. L. Toulme, secretary of the National Wholesale Grocers' Association, announces that at the Chicago convention an amendment to the constitution will be offered as follows:

"There shall be a permanent committee of the association known as the Advisory Committee. It shall consist of all ex-presidents of the association devoting their principal time and effort to the wholesale grocery business, and its chairman shall be appointed by the president from that committee."

The amendment has already been endorsed by the Executive Committee of the Association, and its formal adoption is expected at the Chicago meeting.

The American's Convention—Preliminary reports indicate the convention of the American Wholesale Grocers' Association, which will be held in Dallas, Texas, May 13 to 16, will bring out a large attendance.

Many canners selling the Southern wholesale grocery trade now make it a practice to attend the conventions of the American Association to renew old friendships and book business for the coming year. Many of them install displays of their packs at the convention hall, a food show generally being one of the important features of the American's convention.

The program for the convention is now in the course of final preparation, and will be announced within next few weeks.

Philadelphia Merger—Two of the oldest wholesale grocery concerns of Philadelphia have just joined forces, the business of Kirk-Foster & Co. being merged with that of the Comly-Flanigan Co. on April 1st.

William T. Kirk, of Kirk-Foster & Co., becomes vice-president and general sales manager of the Comly-Flanigan Co.

The brands established by Kirk-Foster & Co. during their more than twenty-five years of business in Philadelphia will be continued.

This merger is a continuance of the pronounced trend among wholesale grocers to consolidate their business to cut down overhead and increase turnover and distribution.

The buying department of the Progressive Stores, Inc., of New York City, has been moved from Park avenue, Manhattan, by Jones Bros. Tea Co.'s general offices at 68 Jay street, Brooklyn. The Jones Bros. Tea Co. now owns the business of the Progressive Stores.

John T. Rottman is in charge of buying for the Progressive Stores, assisted by M. M. Krasnoff.

J. T. Jarrel, president of the Arkansas Wholesale Grocers' Association, was one of the principal speakers at the annual convention of the Retail Grocers' Association, of Little Rock, Ark., last week.

C. W. Linthicum, secretary of the Arkansas Wholesale Grocers' Association, and widely known as the "Arkansas diamond expert," also spoke at the meeting.

H. M. Foster, secretary of the New York Wholesale Grocers' Association, announces that his organization is now conducting a drive for new members.

The committee in charge of the drive is composed of Kenneth L. Sills, H. E. Sayre, Joseph Socolof, Stanley Seeman, J. L. G. Green, Herman Neubauer, Julius Stein and Henry L. Meyer.

W. C. Sutherland, of Sutherland & McMillan, Pittston, Pa., wholesale grocers, was on a buying trip to New York last week.

J. Spencer Weed, former vice-president, has been elected president of the Jones Bros. Tea Co.

Harry L. Jones, retiring president, becomes chairman of the board, and will continue to direct the company's affairs.

M. L. Toulme, secretary of the National Wholesale Grocers' Association, spent several days in Chicago last week arranging details for the annual convention of his organization, which will be held at the Hotel Congress late next month.

Factory Sanitation

Factory sanitation is the unfailing protection which the quality of your product receives when uncleanliness of various description is removed from machinery and other canning equipment.

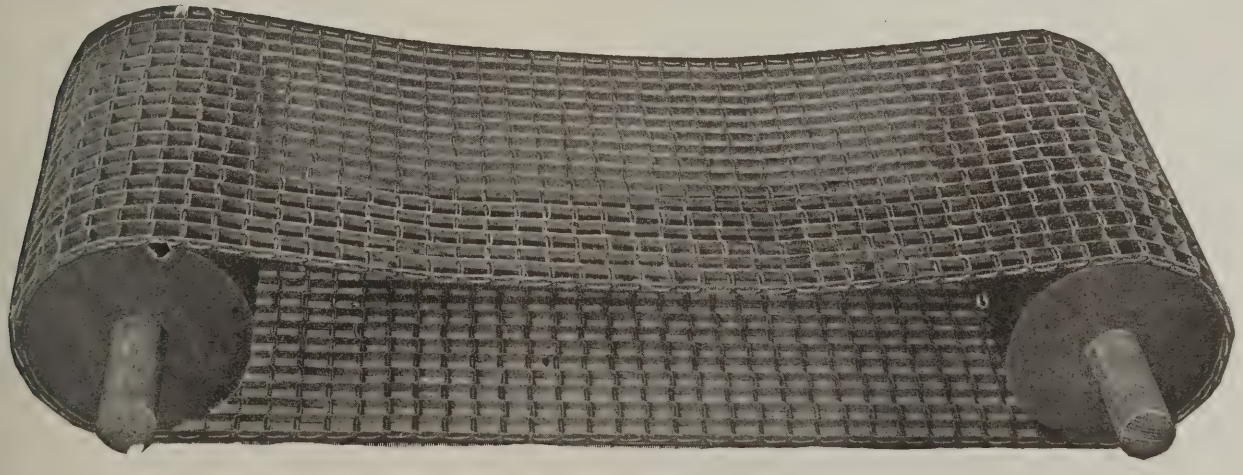
To insure the greatest possible assistance in the attainment and the maintenance of this protection canners by the hundreds are using

Wyandotte
Sanitary
Cleaner and Cleanser

And the reason why it is able to render this assistance is because it cleans until there remains practically no objectionable matter to multiply after the containers are sealed.

Your supply house will promptly fill your order for this cleaner, or write us for further particulars.

It cleans clean.



Indian in circle

HERCULES SANITARY FLEXIBLE STEEL CONVEYOR

The sanitary belt with the square mesh. Used for all conveying purposes, on Sorting Tables, Scalders, Washers and Exhausters. Made any size. Easily cleaned and durable. If your dealer doesn't handle, write for catalogue and prices.

MANUFACTURED BY

LA PORTE MAT & MFG. CO. **La Porte, Indiana**

The Foundation of A GOOD LABEL

The design may be beautiful and the inks of the best quality but if the paper isn't right the label will not be right.

A good label must have a good foundation—fine paper. It must be paper that will stay white with age and it must be the right finish for color printing purposes. Also it must have the strength and texture to give maximum production on labeling machines.

We test every lot of paper we receive to make sure that it fulfills all these requirements. We use nothing but the best quality of coated and uncoated papers made for us on our order and always by the same formula.

On this foundation we build—with the taste and skill of long experience—labels that help sell goods.

CONSULT OUR TRADE MARK BUREAU

We maintain a bureau of brands and trade marks for the benefit of our customers. Write us for particulars. The service is free.

SMILE AWHILE

THE LATEST DOPE

Detroit—Henry Ford has sold his flivver factory to the American Can Company.

THE TRUTH WILL OUT

Bo—Ah just heard dat dey done found Napoleon's bones.

Rah—Faw de lan's sake! Ah did not know he wuz a gamblin' man—Punch Bowl.

DANGEROUS HABIT

They fell to discussing the absent-mindedness of the acquaintance who had just passed.

"That habit nearly cost him his life when he was on his vacation," remarked one.

"How was that?"

"He fell overboard and forgot he knew how to swim."

HIS MONEY'S WORTH

A man bought a suit from a Jewish clothier for ten dollars. When he opened the suit at home he discovered it was alive with moths. He took the suit back to the Jew and said:

"I can't take this suit; it's full of moths." To which the Jew replied:

"Well, vat do you vant for ten dollars? Mocking birds?" —Sun Dodger.

OUT!

Grocer—Sorry, young man, but you won't do for this business. You stutter too much.

Applicant—W-why, s-s-sir?

Grocer—Well, you see, folks are so suspicious of us grocers that they think we sand the sugar an' everything. When they ask questions it wouldn't do to have a clerk hesitate with his answers.

TRADE MARK

Bimms—You are Mr. Addison Simms. I met you ten years ago in Seattle.

Simms—Can't say that I recall our meeting. What a remarkable memory system you must use.

Bimms—Oh, I have no system at all. I merely recognized you by that grease spot on your shirt.—Gargoyle.

STRAINED ENJOYMENT

Mrs. Rufus White, head of the White family, having joined the church choir, Rufus was obliged to put up with her practicing morning, noon and night.

"Does yo' enjoy yo' wife's singing?" he was asked one day.

"Oh, yas," he answered dutifully, "but," he added, sotto voice, "it ain't becaze Ah pa'tic'ly likes to."

GET AN AUXILIARY PUSH TANK

A wealthy motorist, while touring through Georgia, drove up to a gasoline station and found the tender a lazy country boy.

"Hey, boy," said the motorist, "I want some gasoline. Get a move on you. You'll never get anywhere in this world unless you push. Push is essential. When I was young I pushed and that got me where I am."

"Well, boss," said the boy, "I reckon as how you'll have to push again, 'cause we ain't got a drop of gas in the place."—Columns.

TALKING BUSINESS

Madge—I never allow a young man to kiss me more than a dozen times in a year.

Ted—Well, we'll probably have a scrap before then, so I'd better take the whole quota now.

EDITORIALS

A PETIT NATIONAL—Convention of canners will be held in Chicago during Eastern Week, and you will have to be there. Everybody else will be it would seem. And don't forget your railroad certificate.

INGRATITUDE—The National Canners' Association is making a particular drive at this time for increased membership. When we say that, most non-members will say to themselves, "they want more money." That is not the purpose of the drive, in fact the very reverse is the truth: If they can increase the membership and hold the present status of the Association, so far as financial assistance is concerned, they will reduce the dues. In other words the N. C. A. is not in need of more funds, and the drive is not for money. The Association is in splendid condition and will go right along being the great assistant it is to its present members, if it does not secure another member. But it is anxious to extend its helpfulness to more canners. More members, of course, will give it more influence, but the drive is for the benefit of the canners, not for the benefit of the N. C. A.

But the old dollar sign sticks in the nostrils of most canners when they are asked to take membership in this Association. "What will we get for our money?" That is a perfectly legitimate question, and the man who asks it honestly is honest with himself, and will take an honest answer, will find no trouble in signing an application blank. The trouble with most such questioners is that they demand a whole lot more for their dollar than it is worth, and many times more than they would give for the dollar. But let's consider it on the dollar basis, and leave aside, for the time, all consideration of other values—a united industry, cooperation with fellow cannners for the good of the industry, defense against the common enemy, and all that tremendous benefit which comes from a united industry as compared with the helplessness of the separate individual—and it may prove that on the dollar basis the non-members owe the Association quite a tidy sum today. Take the matter of the flat allowance of ½ of 1 per cent. on every case of goods packed, and which a united effort of the buyers would have most certainly put upon every canner, had it not been for the N. C. A., representing the united canning industry. The bald truth of the matter is that practically every canner was ready to grant this allowance and the N. C. A. saved everyone of you in spite of yourselves. Saved what? Well, do your own figuring. Suppose we take a round figure of 10,000 cases, at a purely nominal valuation of $3 per case; $30,000 at one-half of 1 per cent. equals $150. By reducing this to one-quarter of 1 per cent. which the N. C. A. succeeded in doing, you were saved $75. If you paid on every single case of the 10,000. Multiply this to make it equal your actual pack and place the actual value on the goods you produce and you will find the saving increase very materially. And then add the saving from the warehouse stock on which you will be asked to pay only absolute losses from spoilage, and still more important, freedom from the innumerable claims which seemed, if they were not, unjust and without end, and which invariably led to bad feelings and discontent. For remember under the old style you not only allowed the one-half per cent. flat, whether there were any spoils or not, but when the spoils came about you paid for them also, and in addition. The man who takes the dollar sign as his shield when asked to join the N. C. A. will find himself in an uncomfortable position, as being an ingrate if he does not pay his dues to the N. C. A. Under the old flat claim allowance it was estimated that the industry would be taxed $1,500,000—at the time the bills were made out. Gone, absolutely never to return. If we figure the saving made through the operations of the N. C. A. at only half this amount—and it is very considerably more than that as we have shown—this one act of the N. C. A. saved the industry $750,000. And every canner in the business shared in this saving. Therefore, every canner is indebted to the N. C. A. for that saving would run the Association for a couple of years, and it is saved every year. Therefore, in this sordid monetary consideration, the N. C. A. has earned your dues and more.

President Clark is urging you, in this issue, to join with your fellow canners. Get behind him; help hold up his hands; take a part in the great work of this greatest trade association in the country.

ANSWERING QUESTIONS—As the industry expands and takes on added importance, more and more men find themselves in need of information of a definite nature and kind, where as in the past mere generalizing sufficed. As a result our mail is growing more bulky with each passing week, and the range of questions is covering a very much wider territory. It is farthest from our desires to avoid any bit of this service, but because we know that many questions are never asked we want to suggest now that when in need of such information we believe you will find it in the Almanac of the Canning Industry, which we sent, in February, to every subscriber, and which we are sending out now in a steady stream to jobbers, brokers and others. We are impressed with the fact that many of our readers do not know how to use this Almanac, and do not understand that it contains the answer to the very question about which they may be puzzled. Learn to use this Almanac; turn to it for what you want. Men who have learned to use it consider it "the Encyclopedia of canning information," and that is what we have tried to make it. So for your own sake learn to use this annual Almanac.

ABSTRACTS OF CANNING TECHNOLOGY—Dr. Bigelow, chief of the N. C. A. Research Laboratory, has begun a most interesting and valuable compilation under the above heading, and which he is publishing in quarterly volumes, beginning January, 1923. These first volumes cover the year 1922, and give the title, page number, date and a brief description of all scientific or helpful articles bearing on the canned foods or kindred industries, as they appeared in trade journals, scientific papers or elsewhere, carefully arranged and fully indexed so that the reader may find anything that has been published upon the subject he has in mind. In other words this constitutes a compilation of all technical articles, wherever they may have appeared, indexed in a thoroughly comprehensive and intelligent manner, and presented in convenient form at regular intervals. The value of it is apparent. We understand that the Doctor has made connections with about 50 fellow scientists to report any and all matters of interest on the subject, as they are published and wherever published, and he has taken upon himself, in his spare time, the job of arranging and tabulating them for publication. In the four volumes under question he presents 785 such subjects, covering, as we have said, the year 1923, which will give the casual reader some idea of the amount of such matters that is served to him, and at the same time shows the size of the task the Doctor has taken on for his leisure moments. The great value to the user is the Index and it will increase with the passing years, until after, say 10 years, there will be presented here a record of work that will be most imposing. The volumes are sent to members of the National Canners' Association only.

HOME-TOWN NEWS--The Canned Goods Exchange held its forty-third annual meeting on Tuesday April 18th, and elected President Killian for another term, and with him most of the other officers and a full list of committeemen. Mr. Killian has determined to put new life into this fine old body and is doing it. They will hold a big banquet on Tuesday evening, April 22nd.

Mr. Eugene Thomas who, for years was in charge of the Booth Packing Company, has joined the forces of the H. J. McGrath & Co., and will bend his energies with Benjamin Hamburger to put this fine old company just a few steps further ahead than it has yet been.

* * *

Dame Rumor says that Mr. O. C. Huffman, of the United States and the Virginia Can Companies, and who has long wanted a can factory in Baltimore, has bought out the Atlantic Can Company.

* * *

Some of the heirs of the late Thomas J. Meehan, known the length and breadth of this land as the dean of the canned foods brokerage fraternity, and always looked upon as a wise guide and counsellor, are seeking to break his will, claiming he was not competent to make a will. "Marvelous," as he used to say.

JOBBERS5 LABELS EXEMPTED

Wisconsin Amends Its Label Requirements to Meet Jobbers' Labels

The Wisconsin Pea Packers' Association, Inc.

April 7, 1924.

General Order No. 11-R.

To All Wisconsin Pea Canners:

Gentlemen: The following from the Department of Markets:

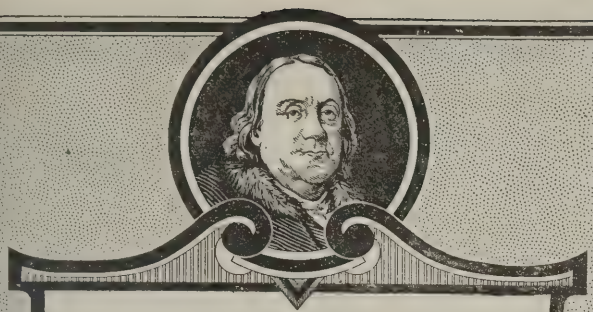
State of Wisconsin,
Department of Markets.
Amendment No. 1 of General Order No. 11-R.
Madison, Wis., April 5, 1924.

Under authority of Sub-section 7 of Section 99.24, Wisconsin Statutes, General Order 11-R, dated August 14, 1923, and effective June 1, 1924, is hereby amended by adding, at the end of said Order, the following paragraph:

Definition of the Term "Label."

The term "label" shall mean only a label which is owned by the person who markets the peas.

EDWARD NORDMAN,
Commissioner of Markets.



Also the following under date of April 7, 1924, to the Canners and Distributors of Wisconsin Peas:

"General Order 11-R, requiring that the label upon a can of peas bear a statement of the variety and size of the peas, has been amended so that a Wisconsin canner may attach buyers' labels even though they do not comply with the requirements. The statute imposes no liability upon either the canner or buyer under these circumstances, except that the buyer may not use such labels when reselling or otherwise marketing the peas inside of Wisconsin. This action was taken in response to the practically unanimous sentiment of pea packers and jobbers expressed at a public hearing held in Madison on April 2. The order, as amended, is effective June 1, 1924.

WISCONSIN DEPT. OF MARKETS."

This seems to be a very satisfactory solution of a difficult and vexatious problem, and I feel that all will appreciate the satisfactory manner in which this has been handled. Yours very truly,

W. E. NICHOLOY,
Business Secretary.

Better Seed For Canners

By PAUL WORK

Associate Editor "Market Growers Journal" and Member of the Staff of N. Y. College of Agriculture, Cornell N. Y. Before Extension School for Canners' Field Men

---

What is good seed?

1. **Clean.**—Free of foreign matter, weed seeds, etc.

2. **Viable.**—Able to establish a plant in the soil and carry it to the point where it can grow independently of food stored in the seed. This is the progress of "germination" as distinguished from mere "sprouting." Blotter, sawdust, rag-doll tests show sprouting. Soil test covers visability or complete germination. Rag-doll test for corn gives a line on disease in the seed.

3. **Disease Free**—Seed may be freed of disease from the first, having never been infected. Some diseases carried on outside of seed coats. Controlled by external treatment; e. g. black rot of cabbage, controlled by corrosive sublimate. Some carried within not readily controlled (as anthracnose of beans), or controlled by internal treatment (as black leg of cabbage, hot water treatment. Write Department of Plant Pathology of your agricultural college for details).

4. **True to a Good Name.**—Most significant of the four points as regards vegetables. Little trouble with cleanness. Viability is important, but a lowered percentage of germination can be tolerated if it is known, if price is proportionate and if type is excellent.

Some varieties of little merit. Having chosen a good variety, seed should be true to the accepted type of that variety. Same applies to strains of varieties. (Tomato is a "kind", Earliana is a "variety", Sunnybrook Earliana is a "strain". Many houses maintain their own "stocks" of a variety or strain and one house may maintain several stocks of a variety or strain. Three groups of characters to consider:

General—Those that distinguish varieties from one another, e. g., Golden Bantam is early (not earliest), yellow, eight-rowed, flat grained, high quality. These characters easily determined; short trial row shows them up.

b. Performance characters, yield, vigor, evenness of maturity, etc. Extremely important, but must have sizable plat for trial, repeated in various locations and years, and must take careful measured records to determine.

c. Special characters. Conformity to trade demand, suitability for market, canning processes or other purposes, adaptation to local soil and climate. Must be determined by special test on commercial scale and repeated.

II How get good seed?

A. Buy it. There is good seed and it is being made available as fast as demand makes it possible to produce it at a profit. Seedsmen are specialists and have many advantages in experience, location, economy, etc.

1. Learn the seed game and seed trade conditions.

a. Originator. Develops a new variety or strain by selection or crossing, or both.

b. Introducer. (May or may not be originator). Places new variety or strain on the market through catalogue or otherwise.

c. Specialist. Becomes interested in a variety and maintains his own stock seed, and may or may not produce market seed. Often has his own ideas of the type, and selects accordingly.

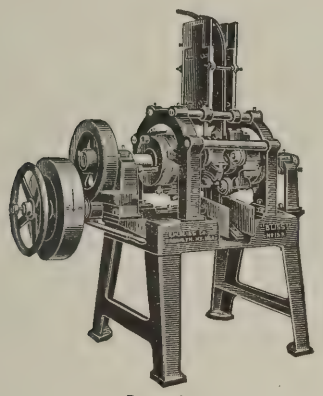
d. Merchant. Deals in seed without taking any special part in its production. May or may not use special care in buying for his trade.

e. Stock Seed. Is seed produced under the most careful selection from which a crop of market seed is to be grown in quantity. If stock seed is right, market seed crop will usually require only roguing to eliminate off-type plants.

2. Study character, ideals and integrity of seed houses. Find out what class of trade they serve. Read catalogues, correspondence, etc., noting the kind of statements that are made, the general "tone", extravagant claims, etc.

Discriminate between statements of opinion and statements of facts. "Best canning variety" is opinion. "Grown on our own farm", "Eight-rowed, yellow, flat kernel", "Imported from Holland" are statements of fact. Ask specific questions freely both for information and for indication of character of house. Heavy buyers can get information and service that would not be warranted for small buyers.

3. Develop cordial business relations. Remember the deal is two-sided. Recognize that the seedsman is entitled to fair return for goods and service. Dealing on plane of mutual interest makes for mutual understanding and confidence which leads to good service. favorable terms, etc. If a house has what you want and serves you well, consider yourself its client, continue the trade and give the house a chance to learn your needs and to meet them.



4, Buy as near the source as possible. Originator, introducer or specialist more likely to excercise due care than contrast grower or mere merchant, though this rule is necessarily flexible.

5. Where possible, buy seed supply a year ahead and make field trial. (Hardly feasible with peas, beans and corn). Otherwise get samples a year ahead. In doing this ask stock number or other designation in order to be sure of identity of stock. This involves confidence in the house. Use stock numbers in placing repeat orders. Many houses have more than one stock (or parentage-line) of a given variety.

6. Stand ready to pay for the quality you demand. It is costly to produce. This does not mean that high price necessarily means quality nor that one should pay more than seed is worth, but that good seed is worth more.

Perfect Flanges without Cracks

BLISS

Patented

"BLISS" Automatic Flanger

AN ESSENTIAL to a perfect sanitary can is a correctly flanged body. Our #15-K Automatic machine flanges simultaneously both ends of round sanitary can bodies, producing uniformly perfect flanges without cracks. With its installation you are assured of one of the essentials of perfect sanitary cans. That these machines are operating successfully in every independent can shop in the country is proof of their merit.

b. Known characters. Selected to own ideal.

c. Education and personal satisfaction.

d. Profit from sale. Good prices if work is well done.

done.

II B. 2. Points against.

a. Exacting work requiring knowledge of principles, keen observation, aptness in judging, close application to details.

b. Demand for labor and attention comes at busy season.

3. Canners in better position than small users of seed as much seed is required and they can in many cases afford the investment. Canners may unite through trade associations to produce seed. Help of experiment stations is available. On the other hand, three or four main crops have bulky seed. Peas and beans best grown in west.

OHIO CANNERS WORKING WITH THEIR EXPERIMENT STATION.

A Report of the Seed and Soil Committee Studies to be Made—Secretary Irons Urges Closer Reading.

Clyde, Ohio, April 3, 1924.

We enclose a report of Chairman Sears of the Seed and Soil Committee, which discloses that a wonderful progressive program has been mapped out with the officials of the Ohio Experiment Station at Wooster to promote additional research on many canning crops of Ohio. Congratulations to our Committee.

It is pleasing to note the entire staff of the Experiment Station participated in this conference. It conveys the fact that they are interested in the Canners. More and more the Canners crops are coming into prominence among the farmers of the State; and more and more will it become an established crop if results of research will make one acre produce what two does now.

Our Experiment Station becoming so active, it will not be long until Ohio Canners will be receiving bulletins from there, giving results of the research work done on canning crops. It was stated by a prominent canner last year that not enough attention was being paid by Canners of Ohio to the agricultural part of their canning business, and we agree with him.

Did you read the articles published in the Trade papers recently? One "discussing the relative merits of sweet corn varieties for canning and the relation of maturity of the corn to the quality of the finished product." Also one on "The Culture and Canning of Spinach." Another of the "Breeding peas from single plants." And another on the "First survey of Illinois Corn Canning." All coming from the Department of Agriculture in various States and from the Capital. It reveals what other State are doing and Ohio is getting in line.

(By the way, do you read your Trade papers? They carried all above articles on Agriculture in their recent issues. If you don't take them subscribe at once, for it is just as necessary to have these good Trade papers on your desk as it is to have a good boiler in your engine room.)

The grower is always eager to learn how he can produce more on an acre; he does not study all crops as he should, perhaps, but the Canner can study the canning crop for him and can convey the message to him. If you can assist him to produce twice the volume on an acre, it will be of better quality and he can afford to do it for less money; and both the Canner and grower can make more money, have less friction and be better friends for it. Give more study to the agricultural end of your business—read your Trade papers.

THE OHIO CANNERS ASS'N

REPORT OF COMMITTEE

Chillicothe, Ohio,
March 31, 1924.

To the President and Secretary
Ohio Canners Association:
Gentlemen:

Your committee on Seeds and Soil was invited by Prof. Gourley, department of Horticulture, to a conference at the Experiment Station at Wooster on March 4th last. Dr. C. G. Woodbury was present and throughout most of the day's session the entire staff was present and we were also favored by the presence of Director Williams and Prof. Gossard for a time during the conference.

Unfortunately, two members of the committee could not be present, but will join in this report.

Many problems of the canning crops were gone over in detail and we were assured of all work the station would be able to undertake the coming year. I now have confirmation on the projects as decided upon which are as follows:

1. Spinach variety tests.

2. Breeding work on Henderson Bush lima beans to secure a more uniform and higher producing green seeded bean. Strain tests will be grown on the ground of the Station and in co-operation with growers outside.

3. Breeding work on beets. Variety tests conducted at the station and with growers outside.

4. Experiment to determine which of the varieties of sweet corn when crossed give the largest increase in production.

5. Wilt resistant variety test of tomatoes under Ohio conditions for canner and gardner. Fertility tests will be conducted on tomatoes, sweet corn, cabbage and beans. Pressing Bros. of Norwalk in co-operation with the Station will conduct fertilizer experiments on corn and tomatoes.

This is a pretty comprehensive program and it is sure to broaden and develop from year to year. Prof. Gourley and the entire organization are greatly interested in our canning crops problems and will develop the subjects outlined from year to year as the need demands and as the station funds will warrant.

Very truly yours,
C. H. Sears,
J. Warren Wood,
Chester Swaim.
Committee.

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

Southern Can Company

N. C. A. SECTION MEETINGS AT CHICAGO TO BE WELL ATTENDED.

THERE is every indication that the N. C. A. Section meetings, to be held in connection with the spring gathering of the Western Canners Association at Chicago, will be well attended.

The Ketchup Section will meet Tuesday morning, April 22, with Wade L. Street, Chairman; the Pea Section, Tuesday afternoon, April 22, F. A. Stare, Chairman; and the Corn Section, Wednesday morning, April 23, E. B. Cosgrove, Chairman.

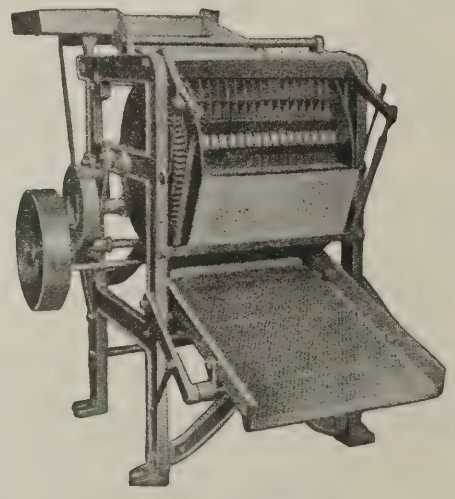
The program of the Pea Section is the first one to be announced thus far. It will consist of an address by President Clark, to be followed by a report of claims paid on losses from canned peas, and an address on "Seed Legislation," by C. G. Woodbury, Bureau of Raw Products Research, National Canners Association. There will also be discussion of the status of pea standards, by Charles H. Hunt, Chairman of the Pea Standards Committee.

President Clark will address the General Session of the eastern Canners meeting on Wednesday afternoon, April 23.

UNITED STATES EXPORT TRADE IN CANNED FOODS

United States exports of canned fruit decreased 28 per cent in 1923 as compared with 1922. Canned milk exports increased about 4 per cent. While exports of canned beans and tomatoes dropped, these decreases were more than offset by gains in soup, peas, corn and asparagus. Canned fish showed the largest recorded gain for any canned food (68 per cent). The chief consumers of American canned foods are England, Canada, Cuba and Mexico.

By R. S. Hollingshead, Canned Foods Specialist, U. S. Department of Commerce.



THE past year in the United States canned foods trade has, on the whole, been reasonably satisfactory, not so much on account of any large increase in volume, but because, in the face of adverse exchange and unsettled political and economic conditions throughout so much of the world, there has been no decline in the trade.

Exports of Canned Foods in 1922 and 1923—The following table summarizes the exports for the past two years, and offers some interesting comparisons:

United States Exports of Canned Foods, 1922 and 1923

Kind	1922 Pounds	1923 Pounds
Meat	14,718,737	16,137,725
Milk	187,496,841	194,264,371
Soup	12,063,015	14,200,272
Salmon	63,797,297	59,594,422
Sardines	20,059,845	33,660,937
Vegetables:		
Tomatoes	9,762,870	9,095,446
Peas	2,523,219	3,909,363
Corn	2,870,578	3,190,531
Asparagus	6,230,157	8,766,431
Beans	7,367,512	5,446,332
Other	3,617,797	2,902,984

American Canned Foods Stand Quality Test—For many years canned fruits, largely the products of California, have been exported to all parts of the world, and have successfully met foreign competition on the quality basis. In no other country has this branch of the industry been carried on with such careful attention to the selection of the stock, excellence of workmanship, and close supervision of the technical details necessary to secure the sterility and appearance of the product. To maintain these standards of quality, and as a result of high duties in many consuming countries, it is neccessary that the selling price be somewhat high. In many foreign markets these products are considered luxuries and are sold only to people possessing a comparatively high-purchasing power. The market decrease in the exports of canned fruits—amounting to 28 per cent, based on the 1922 exports—can be attributed partially to the reduced purchasing power for luxury goods abroad, and partially to the well-sustained consuming power of the domestic markets. The decrease in exports of canned fruit is the only adverse phase of the export trade in canned foods, all the other classes showing gains.

Cuba the Leading Buyer of Canned Milk—Canned milk (including evaporated and condensed milk), has been somewhat unusual in its course. For the first 11 months, compared to the same months of 1922, there was a decrease of about 7.4 per cent. During December, there was a great increase in the foreign demand, so much so that the exports for that month were larger than those of any month for the last two years. This sudden gain brought the total for the year nearly to 200,000,000 pounds, an increase of about 4 per cent, based on 1922. England, Germany, France, and the Philippine Islands, are our best customers for evaporated milk, while condensed milk goes to Cuba, to China, Japan, and other oriental countries. Cuba is by far the largest consumer. Increases in other milk products such as condensed skimmed milk, sweetened and unsweetened, and dried milk, have appeared during the year.

Canned Vegetable Trade Encouraging—Large Gains in Canned Fish—Exports of canned vegetables have been gratifying, and point to still brighter prospects for the future. There was quite a large decrease (27 per cent) in the exports of canned beans, and a smaller decrease in canned tomatoes, but much more than offsetting these are the increases in canned soup (17 per cent), canned peas (58 per cent), and canned corn (11 per cent), and canned asparagus (28 per cent). The increase in the exports of canned soups are largely due to the activity of one manufacturer in making a foreign market for a previously unknown product. The increases in exports of canned soups are largely larly favorable at this time, for the pack, according to figures of the National Canners Association, is the largest in the history of the industry. Domestic prices have held up throughout the year, which may be attributed, at least in part, to the foreign demand. The generally high standard of quality of this product has also helped in the export trade.

Canned fish show rather large gains for such an important product. Although canned salmon exports decreased, the increase in exports of sardines more than compensated for it. This increase (68 per cent) was the largest recorded for any canned food. It is believed that this is due partially to more intensive selling, especially in the Far East, and also to an appreciation of the improvement in the quality of American-packed sardines. The statistics for all the kinds of canned fish products are not separated, so it is impossible to discuss possible changes in exports of products such as canned shrimps, crabs, and lobsters. Canned meats show an increase of almost 10 per cent. The amount is far below that of the war years, but it

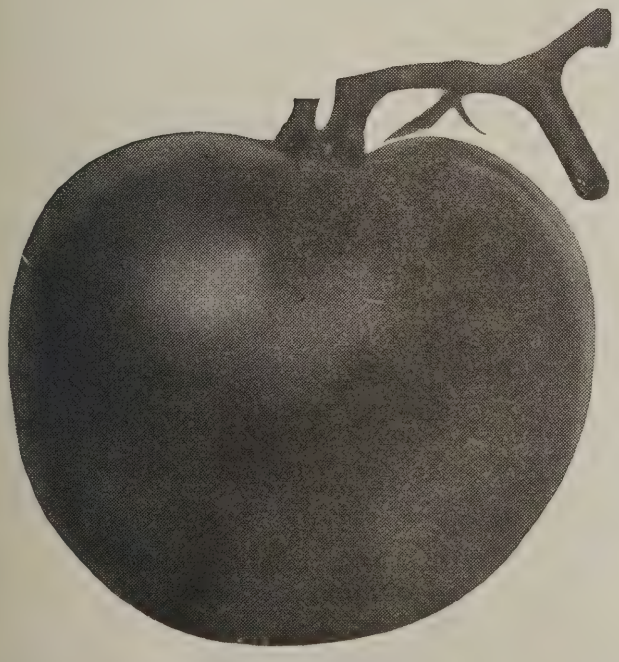
Just as We Predicted - - It Made a Big Hit.

A greater number of Canners placed orders for INVINCIBLE CORN HUSKERS at the Buffalo Convention than any Convention at which we ever exhibited, — and more are ordering daily.

THE 1924 MODEL INVINCIBLE HUSKER IS LIKED FOR ITS SIMPLICITY.

The demand is going to be big, but we are prepared for it.

Corn worms cannot possibly affect the proper functioning of INVINCIBLE Corrugated STEEL ROLLS, whereas, Rubber Rolls become greasy and they cannot be sterilized with hot steam.



Steel Rolls are sanitary. That alone is a sufficient reason for you to use INVINCIBLE HUSKERS, the only all steel roll Husker.

One price to everybody $375.00 F. O. B. our works.

is interesting to note the tendency to increase. England, Scotland, and Cuba are the most important consumers of these products.

England, Canada, Cuba and Mexico are the largest consumers of our canned foods at the present time, although there is a very large potential market in Latin America. Under the existing tariffs in many countries, however, large exports to them are impossible, as the necessary retail price places the product out of reach of the vast majority of the consuming public.

American Exporter Must Meet Increased Foreign Competition.—Foreign competition in canned foods is becoming quite important for the American producer. Through the development of immigration in Australia and the increasing population there, and the growing industry of British South Africa, new sources of fruits for canning have appeared.

The trade in canned fish is somewhat peculiar. We are both importers and exporters of canned sardines. Our exports are largely of cheaper grades, while most of the imports are fancy grades. The canned-salmon industry of this country and Canada, located on the Pacific coast, for many years had no competition. Recently a number of factories, largely of Japanese ownership, have been established in Siberia, and their products are highly competitive. Through an association, they are carrying on rather extensive advertising campaigns, especially in England, and it is believed that the American exporter will need to be active to preserve his markets.

VERY SERIOUS IF TRUE

"Farmers are being starved off the land at the rate of 100,000 a month, eliminated as income taxpayers and their purchasing power cut in two," said Congressman John W. Summers, of the Farm Export League, to representatives of the press.

"The farmers" purchasing power is reduced from twenty-five to fifty per cent. Instead of meeting the family needs in the usual way," said Mr. Summers, "millions of farmers are limiting their purchases to bare necessities. This is being reflected to the factories and commercial concerns of the east and south.

"As a matter of fact constantly selling for less than the cost of production is starving farmers off the land at the rate of a hundred thousand a month, and the end is not yet reached.

"The necessity for the immediate passage of a stabilizing, equalizing far mmeasure such as the McNary-Haugen Agricultural Export Bill, is reflected in these significant figures:—during fifty years, from 1870 to 1920, there were 3.050 bank failures recorded in the United States; in three and a half years 1,484 banks, largely in agricultural States, have closed their doors, and the last few months have been the worst. In other words, about half as many banks have failed in three and a half years as in the preceding half century.

"Statistics show that the farmer has been almost wholly eliminated as an income tax payer. These conditions point to an economic condition so grave as to arouse the entire nation to the necessity of action.

"We believe the Agricultural Export Bill, when enacted into law, will go far in helping the farmer to solve his problems. It should have nation-wide support."

We find difficulty in seeing just how an export bill will help the farmers. All the rest of the world has either a surplus of crops, and, therefore, low prices, or no money to buy America's surplus. The farmers' trouble is the lack of the old plentiful supply of cheap labor, due to restricted immigration, and the ability to get well-paying jobs in the cities. But this labor employment ought to increase demand at good prices, and it does, so the onus of the trouble would seem to be found in the lack of immigrants.

MAKING SURE WITH FERTILIZER

Maurice Lux, of the well-known corn-growing family of that name, living at Shelbyville, Indiana, was awarded the junior championship at the 1923 International Hay and Grain Show, for his exhibit of 10 ears of corn grown and selected by himself.

Commenting on his methods, he made this statement, "As I was in school, I had nothing to do with preparing the seedbed, but the ground was clover sod. This is a mighty good place to grow corn, because of the fertility; but I further made sure of a good yield by using 75 pounds of commercial fertilizer. This tested 6 per cent potash and 12 per cent phosphoric acid."

Maurice grew 101.5 bushels of corn on his contest acre, at a cost of 36 cent a bushel.

G. H. Hanna of Dansville, Michigan, applies 80 to 90 pounds of complete fertilizer per acre with the corn planter. He states that in his experience, fertilizer has increased the yield 15 per cent, and starts the crop quicker which is a big advantage if the spring is cold. Other benefits he names are earlier maturity, fewer nubbins and better adherence to type.

No. 30A Automatic Strip Feed Press

This Automatic Strip Feeding Press is adaptable to the rapid and economical production of can ends or other articles made from tinplate or light sheet metals up to 4'' round or square. The feeding mechanism is entirely automatic giving an output of from 60,000 to 100,000 a day and is arranged so that change gears may be utilized for handling from 3 to 20 cuts to the strip and stock up to 29'' in length. The positive action of feed not only allows a high capacity, but insures an accurate register for decorated work. As on all our automatic presses an improved friction brake is provided which does not engage crankshaft until clutch is released. To prevent damage to dies, press is equipped with a recent improvement which automatically stops the entire mechanism when conditions are not entirely regular. Standard equipment includes attachments for one size only with exception of dies. Attachments for additional sizes can be promptly furnished at extra cost.

A Frank Statement To Non-Members of the National Canners Association.

By ROYAL F. CLARK, *President*

FOLLOWING the optimistic spirit of the entire membership as to the work of the National Canners Association and its opportunity for further work, a campaign for membership was launched, commencing in March, and will end in May of this year. An increased membership will reduce present dues without impairing the efficiency of the organization. Therefore, every present member is an interested party and as such has been requested to help in the solicitation of non-members. However, this interest is not alone financial. It is an interest in making the National Canners Association a stronger organization with added prestige, and it is therefore my most earnest wish that the service of the National Canners Association be sold to non-members.

It seems to me the proper way to present the matter of joining the National Canners Association to non-members is to frankly inquire whether, in their opinion, the work now being done by the N. C. A. should be dropped. Those canners who are familiar with the work feel that the results obtained are indispensable. I believe that the canners have become better acquainted with the work during the past year or two. There has been unusual attention given to addresses made by technical men from the laboratories at conventions, whereas a few years ago scientific men were merely tolerated. It seems to me that each canner ought to ask himself these questions:

1. Can we safely dispense with the study of spoilage, including flat sours, particularly in view of the fact that new types of spoilage are constantly occuring?

2. Can we safely dispense with the study of botilism, or rather with the study of methods and apparatus to carry on this kind of work, and in this connection I would like to quote what Dr. Meyer said in reference to the outbreak of botulism in 1919:

> "Extensive experience has definitely proved the broad applicability and absolute reliability for this standard method. Furthermore, it

HAMACHEK IDEAL VINERS

IT is of great importance for a packer to be equipped with Hamachek Ideal Viners. This enables him to get a larger percentage of better quality and increases the pack of the smaller and higher priced siftings. It often prevents bunching of the crop which might result if the packer is obliged to wait until the peas are advanced so that a less efficient viner can satisfactorily thresh them.

Frank Hamachek Kewaunee, Wisconsin

Manufacturer of Viners, Viner Feeders and Chain Adjusters. Machinery Manufacturer Since 1880

must be said that without this method it would have been impossible to conduct this complicated study on the heat resistance of Botulinus. Careful and painstaking studies which had been conducted by the Research Laboratory of the National Canners Association in developing technique have saved an enormous amount of time and expense. It can therefore be said without fear of contradiction that the two years spent by Bigelow and Esty in discovering and developing the method were of fundamental importance in the work of botulism."

3. Can we safely dispense with the study of discoloration in canned foods, and particularly in corn?

A circular was recently issued by the laboratory outlining progress made in this important study. A second circular, now in press, gives a method which is believed to be a solution of the problem so far as corn is concerned, provided canmakers can make practical the laboratory method which has already been tried out on a fairly large experimental scale.

4. Can we safely dispense with the study of questions involving the manufacture of tomato pulp and similar products?

5. Can we safely dispense with the study of vitamines, in view of the many many publications to the effect that vitamines are destroyed thru the processes of commercial canning? In this connection I will call your attention to the fact that about two years ago space writers were knocking canned foods; and manufacturers of so called vitamine concentrates were advertising their product as valuable, especially to those who found it necessary to use canned foods largely in their diet. Not only were articles published in newspapers, but these ideas were taught in schools of all kinds, from grade schools to colleges. Since that time the laboratory succeeded in interviewing physiological chemists in the study of this question and has participated in this study itself. As far as this work has gone, it has shown that canned foods are richer in vitamines than the same foods cooked in open kettles in the kitchen.

6. Can we safely dispense with the study of the influence of hard water on canned foods?

7. Can we safely do away with the study of springers and perforations? It would hardly seem necessary to call attention to the necessity of greater activity in the study of this important subject.

8. Can we safely dispense with the study of tin plate? This subject was given publicity during the last convention.

9. Can we safely dispence with the activity of the Association in meeting the attacks of the nutritive value, and wholesomeness of canned foods? These attacks usually made in good faith and are the result of lack of information. The information secured by the Research Laboratory in its fundamental investigations has given a stock of information that makes it possible to answer these attacks. As a result, there is a vast amount of correspondence with authors of books and writers of magazine articles who have made misstatements, and which correspondence results in a retraction.

Dependability

The value of efficient and reliable workers is that they can always be depended upon to carry a given task through to a finish.

This is also the secret of the constantly growing demand for

Wyandotte Sanitary Cleaner and Cleanser

In increasing numbers producers of canned foods are learning to place absolute dependance upon this cleaner for all their cleaning work.

For they have always found its quality to be uniform and of unvarying superiority. They have always found its cleaning action, quick, easy and harmless to user and equipment. They have always found its free rinsing a guarantee of faultless cleanliness and a protection to quality products.

Moreover they have always found its use so productive of economy that it is a definite factor in the profitable operation of canned food production.

Peerless Huskers WON'T CLOG

Positive Feed and Discharge
Keep the ears moving in Peerless Huskers.

ONE move won't take you very far. You've got to keep on moving. That's what the Peerless Husker does with the ears of corn— it keeps them on the move from the time they are fed into the machine until they are finally discharged onto the conveyor.

The Peerless Husker carries the ears of corn through the ear mover past the knives and up to the rolls by means of "flights" attached to a chain— one "flight" to each ear of corn. The ear is always directly in front of the flight moving along with it.

When the ear reaches the rubber rolls it is met by a different kind of flight which carries it over the rolls and finally discharges it onto the conveyor.

The feed chains and discharge chains are set in time and a sufficient interval is allowed for each operation.

Each ear is moved along to the different operating features positively, and is constantly kept from interfering with the ears preceeding or following.

SPRAGUE-SELLS CORPORATION

500 NORTH DEARBORN STREET, CHICAGO, ILLINOIS

Peerless Huskers

It is not always appreciated that the research work of the laboratory is of a fundamental nature, and that the results obtained will be applicable for many purposes. This is illustrated by its processing studies (heat penetration and resistance of bacteria) which were conducted for the purpose of preventing spoilage, but were found equally applicable to the study of botulism.

10. Can we safely dispense with Canned Foods Week and ought we not make a greater effort this year in this direction? Production is continually on the increase. Consumption must be increased or someone will most certainly be hurt. No other industry has as wide a field for effect as the canning industry, it having been shown many times that the per capita consumption of canned foods is and has been low.

11. Can we safely dispense with the help and assistance we are now receiving from the National Canners Association in the broadcasting of the truth surrounding the preparation of canned foods.

12. Can we safely dispense with the N. C. A. and be without any organization whatever to combat the false articles of alleged poisoning? I wish every canner might read the voluminous correspondence and know of the vast amount of work done by the Association in this connection.

13. Do we want to dispense with the **National Canners Convention** and the several meetings throughout the year which afford the opportunity for exchange of ideas and give us a better conception of our own business.

14. Can we safely dispense with the connection we have with the several state departments of agriculture formed thru our Raw Products Laboratory?

15. Can we safely dispense with the connections we have with the universities, scientific men, government officials, and the public thru our Association?

I have only touched on a few of the activities of the Association, in fact, only those that have come to my mind in a short space of time while dictating this memorandum, but it does seem to me that these questions should be answered by every canner, and if the answer is in the negative, then why should the burden of financing this organization fall on a few? I am anxious that the membership shall be doubled and believe we now have sufficient new members in sight to make it possible for a reduction in dues to at least 2-5 of 1c per case. The policy of the Association will be to reduce the expenditures as far as possible, but not to interfere with the efficiency of the organization and I pledge my unqualified support throughout the year.

If you have any criticism to offer, write me. If you want to know more about the work, write me. I am at your service.

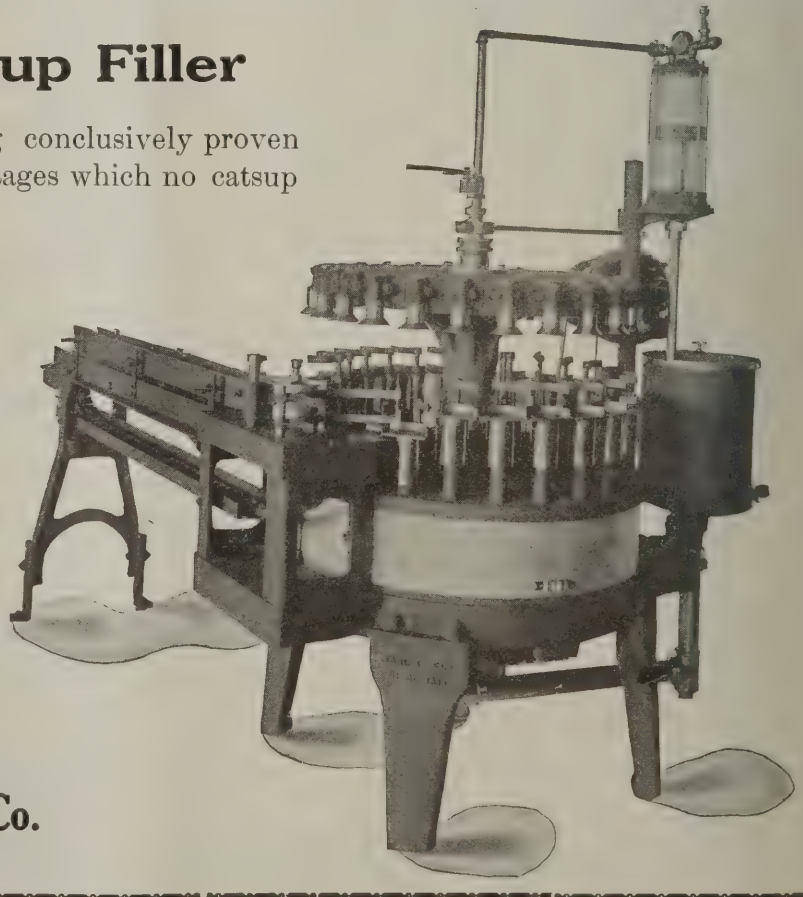
A WRONG WAY TO GO ABOUT IT

The idea that the canneries handle "culls" of any crop—that part of a crop which is not fit to send to market—went out of style many years ago. The fields or orchards do not produce too good quality for the canner, and he is a long way behind the procession who does not know this.

The Kiefer Catsup Filler

The new Kiefer Catsup Filler, having conclusively proven its worth last season, presents advantages which no catsup bottler can afford to overlook.

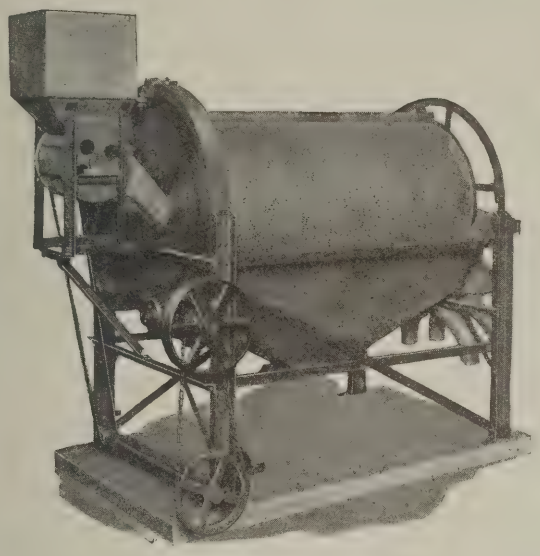
It fills without slop or waste and will not deposit catsup in broken bottles.



There is no perceptible loss in temperature when filling.

Metal contact is reduced to a minimum.

Nothing to take apart when cleaning at the end of the day's run.



We are willing to prove these things to you in your plant. Many manufacturers have already placed their order for this season.

Get your order in before it is too late.

The Karl Kiefer Machine Co.
Cincinnati, Ohio.

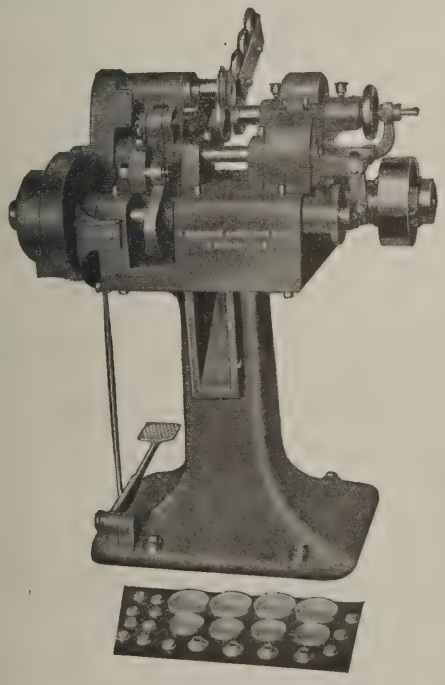
The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.



For the canner who wants individual motor drive we can attach ½ H. P. Motor.

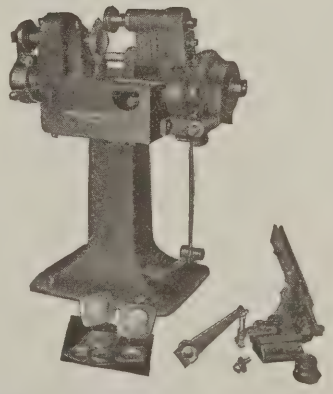
Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.



ONE BLOCK AHEAD OF THE PROCESSION

This No. 46 Thread Rolling Machine is worthy of a place in the "CAMERON FAMILY."

One user writes: "I find it a great advantage to be able to remove the automatic feed when I have odd-shaped articles to be threaded."

We make every machine for "can-making."

CAMERON CAN MACHINERY CO.

240 North Ashland Avenue CHICAGO, U. S. A.

J. O. Booton, in writing us as he did recently may attract the vinegar maker, but not the canner. It is very probably true, however, that from the big crop of peaches mentioned, there will be many hundreds of cars of "tree-ripened" fruit—the finest flavored fruit produced—but which is too good (eating qualities considered) for rail shipment. If this kind of prime fruit is available to nearby canners, they would do well to use it, and could use nothing finer. But this is not "culls."

Mr. Booton's letter reads:

Marshallville, Ga., April 4, 1924.

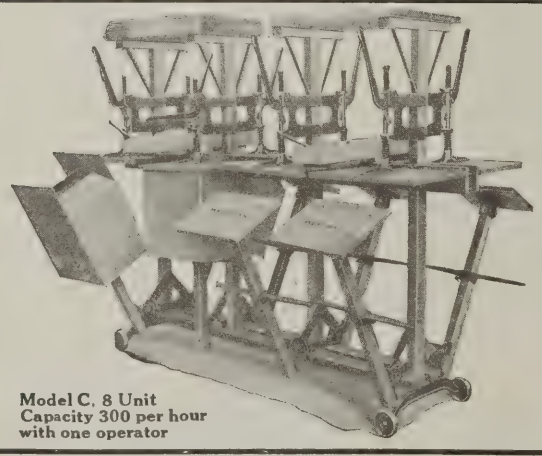
Gentlemen: There will be the culls from around 400 cars of peaches from the operation of two co-operative packing houses in Marshallville, Ga., the coming shipping season (May 15 to August 1). Any canner or vinegar maker who would be interested in working these up, not only for this season, but for the coming season, might do well to address us for detailed information. The establishment of other co-ops. in the town will run the amount available to as high as culls from 1,000 cars. If interested, write.

Yours truly, J. O. BOOTON,
Marshallville, Ga.

UNLESS YOU PACK QUALITY

Secretary Roy Irons of the National Kraut Packers Association recently sent out this circular letter. There is but one answer: unless you pack quality for heaven's sake don't try to advertise the product. That's where the non-member, packing poor stuff, hurts the great mass of good packers. Here is the evidence:

Clyde, Ohio, March 25, 1924.



TO KRAUT PACKERS:

HELP SAVE US

Now we are up against it. In recent months we have received more letters than usual from mystified consumers wanting to know, "What is the reason all canned kraut is not the same; some we get we can hardly eat? We thought canned kraut was all good." Another writes, "The canned kraut we get in this section is so salty we can't use it." And still another writes, "We used to get good canned kraut, but what we have bought lately is hardly fit to eat." There are many more we could quote. How many more are mystified who never write? We guess those who write saying they thought all canned kraut was good, are new users—the others we assume are old users and can't be fooled.

How are we to answer these people? We are on the defensive and have to reply to a courteous and very proper question. It a large per cent of good kraut sold in bulk and the off kraut merchandised thru the can? We don't know what to say to these people and are passing this along to the Canners of Kraut for a proper answer. What shall we tell them?

THE NATIONAL KRAUT PACKERS ASS'N
Roy Irons, Secretary-Treasurer.

Do Your Labels Come Off *BEFORE* They Deliver Your Advertising Message?

The value of your labels depends entirely upon the gum you use for sticking them to your containers. *If the gum does not actually carry your labels to consumers ---you might as well save the expense of labeling.*

We specialize in gums and glues that will not crystalize under any condition, and will positively hold your labels to tin, glass or other surfaces until your advertising message is seen by the consumer.

Bring your adhesive problems to us. Whether you label, wrap or seal your containers --- by hand or machine---there is a *guarnateed* ARABOL adhesive for every purpose.

The Markets

BALTIMORE, APRIL 14, 1924

WEEKLY REVIEW

Canned Foods Business Fine—Retailers Buying Steadily—Spots Will Soon Be All Gone—Tomatoes Lower—Pea Planting Delayed—Season Growing Late—Tomato Growers Threaten High Prices—Futures Are Selling Slowly.

BUSINESS IS FINE—That is just an absolutely truthful statement of the canned foods market as we write. Of course, it does not satisfy everybody—nothing ever does. But this industry has never seen better conditions than exist right now. And to an old market "dopster" the remarkable thing about it is that there is no glaring exception in any item. Usually there is some one article or item which is dragging and keeping some set of canners in the doldrums. But what article of canned foods could be classed in that way now? The retailers are buying constantly, turning their stocks frequently, almost continuously, and are buying actually in a very much better way than in big lots, and thus clogging their movements. Naturally the wholesalers or jobbers must keep buying constantly, also, and although in smaller lots than some would like to see—they are buying, and taking the spot stocks down to the vanishing point. And they are not haggling over prices, to any extent. Everyone now recognizes that the spot canned foods market will be marking time in a short while, as there will be no goods to trade with, the stocks will all be cleaned up. Already those old discarded stocks, which the owners never expected to find a market for, but could not get up heart enough to run out on the dump, are being brushed up and offered at a price, as is, and are finding takers, sorry to say. They are going to a class of poor trade which may welcome them, and they are doubtlessly worth what is being asked for them. It is uneconomic to waste good of any kind, if it be food, even though of a poor grade, and that is where these tailing-over stocks are going. The warehouses are being cleaned out from cellar to attic in the greatest house-cleaning this industry has ever seen, and the heaviest consuming months for canned foods are yet ahead of us. Is there any other way to brand a market situation like this than "fine"?

The Central West is cleaned up on tomatoes and peas, is rapidly cleaning up on corn, and has been cleaned up on string-less beans and some other items for months. Corn is moving at a dollar, and it is becoming hard to find the kind of corn wanted at any price. When they want tomatoes they are forced to come to Maryland and to Virginia, and these two single owners of tomato stocks, always famed for their hospitality, so far from taking advantage of their opportunity by advancing spot prices, are reducing their prices to help out their fellow States in need. Spot tomatoes are quoted lower in this market this week than last! Why? Well, there is no reason for it, and we can, therefore, only attribute it to the good nature of these Eastern tomato canners.

GROWING CONDITIONS—Last week we reviewed the rather favorable growing conditions which confront canners' crops up to this time; but it would seem that these are not without their drawback. "Winter lingering in the lap of spring" is once more threatening the Southern pea crop by making it difficult for the pea growers to get their crops planted. The chill which continues in the air, giving us a feeling of winter rather than of spring, would not matter so much, but the almost continuous visitation of rains, intermingled with snow flurries, keeps the ground in anything but favorable condition for seeding of peas. During the past week we have had the heaviest rains which we can recall ever seeing before, raising tiny streams to roaring rivers and flooding lands and fields. The end of the week witnesses better weather, but it will take a "spell" of this better weather to permit planting on those fields. And it is now getting late for peas. Just how much of the crop has been delayed, hereabouts and in other heavy pea-planting regions, we are unable to say; but delays of this kind are the things that hold down the ultimate pea acreage. If we have good weather over the great pea-canning regions—and where are they not going to can peas this season—the next few weeks will see an immense acreage put out. It will pay every market student to watch carefully the weather conditions these days, because the size of the pea crop and pack is in the making as we write.

And the pea canners are not the only ones. The tomato beds are being made and planted, and the tomato men have learned that the size of the tomato crop depends very largely upon the success of the tomato plant beds. Weather remarks are not mere breezy nothings with this industry, but the most important things that can be considered—until the crops are in the cans.

FUTURES—Nearly every section reports future canned foods are selling but slowly. At the same time these reports are almost invariably accompanied by the explanation that the buyers have covered their requirements to a very large extent, and that most canners have as many orders on their books as they care to place there until they can see more clearly just what they may expect from crops and acreage. This again makes a most healthy condition—far more healthy than is usual in this industry for this time of the year. And, again, all futures are so included, there being no neglected line.

Peas, as is well known, are sold up almost if not to the limit of the canners' prospects, and certainly until they can see more about crop prospects. After the planting has been done they may open up for more, but not until then. So the fellow who wants future peas has to take what he can get and pay what is asked.

Corn is also selling well as futures. Maine reports being as well sold up now as it dare sell, and some of the Western States report the same thing. Maryland continues to sell future corn, and, like tomatoes, has not advanced its prices as much as it might, although it is more on a parity with the Western prices than are tomatoes.

In tomatoes the canners are feeling uneasy, owing to the action of the tomato growers. County agents in this section are generally holding the growers in hand, and some fear that they are asking too high prices for acreage. The general run was supposed to be $15 per ton, but prices as high as $25 are heard, and if the growers try to put this over, there will be but small contracting by the canners, and large growing of the free-lance variety—uncontracted—which in all probability will come upon the market at ripening time and break prices to pieces. It is to be hoped that the Government, which has engineered this combination of growers in a way that it would not permit the canners to co-operate for a moment, will see that the growers keep within the bounds of reason. The Tri-State canners cannot afford to pay more for their tomatoes than other sections of the country, and under the improved yields which better plants showed them were possible last season, $15 per tons is a good price. Yet in spite of these advancing prices by the growers, the canners are reducing their future prices on canned tomatoes. It is to be hoped that the tomato canners will rapidly get the desired quota of futures on their books at below cost of production, as they seem to think they must do or that they cannot operate. They want them and they are getting them at prices which cannot make them a profit. Other sections are wisely letting them alone in this suicide act.

Stringless beans, to which we referred last week as promising to be very large this season, are sold out clean as spots, and a good many canners have had to close their books on futures. Some canners believe that the string bean pack cannot be overdone, that the people will eat more string beans than they will peas. Maybe so, but they will have to be well and carefully packed.

Fruits have made a very decided improvement and are in better demand for both spots and futures.

NEW YORK MARKET

Market Shows Increasing Strength—Prices Stiffening — "Sold Out" Signs Appearing in Place of Spot Stocks — Prices on Tomato Futures Low—Glass Goods Becoming More Popular — Grapefruit Slumps — Sweet Potatoes Cleaned Up.

New York, April 10, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

BUSINESS Good—Continued strength features the local canned foods market, and there was a satisfactory volume noted here throughout the week. The canned foods market has been in good shape for so long that the trade is beginning to accept it as a matter of course, and trading that a few years ago would have evoked enthusiastic comment is now accepted as a matter of course. In consequence, the trade reports the market "still quiet," when, as a matter of fact, it is in the healthiest shape that it has been for quite a few years back.

Prices Stiffening—There is a gradual strengthening of spot values as holdings become depleted, and the pick-up departments of the various jobbing houses here are active in seeking small lots to fill orders on hand. The "sold out" code marking is beginning to find its place in jobbers' buyers' stock books, and the trade is anxiously awaiting the starting of shipments of new pack on some of the more wanted items.

New Ruling on Peas—Following a public hearing at Madison, Wis., at which representatives of the wholesale grocery trade protested against the Wisconsin Department of Markets ruling on the wording of labels of peas bought and sold in Wisconsin, it was decided that exemption from the order shall be granted on Wisconsin peas in interstate shipment under buyers' labels. The ruling of the Wisconsin Department of Markets provides that all canned peas shall be labeled to indicate both variety and size.

Future Tomatoes—Offering of future tomatoes on 100 per cent contracts are noted this week at 55 cents for standard 1s, 85 cents for 2s, $1.25 for 3s, and $3.90 to $4.00 for 10s. Distributors have not been operating very extensively during the week, but they are giving the tomato market more attention, as reports from the Mid-West indicate increasing strength in tomatoes on future contracts in that territory. Wholesale grocers are now working their retail trade for future tomato business, and there are indications that they soon will be in the market for additional futures to cover their sales to the retail trade. Retail grocers appear to be rather bullish on canned foods this spring, and are buying spots with liberality as reports of the growing shortage continue to reach them.

Glass Goods—Corn, peas, tomatoes, beets, etc., packed in glass are becoming more and more popular in this market. Among the leading packers of these products now are the New York Canners, Inc., and W. R. Roach & Co. Since the packers have been featuring the sale of these goods through the chain stores, there has been a sharp gain in consumption. Formerly the fancy grocery store and delicatessen trade handled these goods, and, with the usual liberality of their sort, they were satisfied with only 100 or 200 per cent profit. Now that the chain stores have taken hold of the glass goods and started merchandising them right, they have come into greater popularity.

Market Oversupplied on Grapefruit — Canned grapefruit, formerly a 35 or 40 cent seller, has dropped to 21 to 25 cents per can in the chain stores, and the explanation is found in the reported overstocking of the market here, together with competition of the fresh fruit. A few pioneer canners started grapefruit canning a few years ago, and after several disappointments succeeded in turning out a quality article which met with the approval of the trade and public. As is usual in such cases, there was an immediate rush to get in on the part of other packers, and the present overstocked condition of the market is the result. Despite the present position of canned grapefruit, however, many of the sages of the market are of the opinion that the situation will straighten out and that grapefruit will eventually take its place as one of the leaders of the canned fruit line.

Spot Tomatoes—There has been a quiet movement in spot tomatoes during the week, with increasing strength noted "down below." Canners are strong at 62½ cents cannery for standard 1s and 95 cents to $1.00 for 2s, the outside price representing buyers' labels. Standard 3s range $1.37½ to $1.40, with 10s $4.50 to $4.75. Stocks of 2s, it is reported, are reaching the vanishing point in first hands.

Sweet Potatoes Cleared Up—According to one report from Maryland this week there are only 4,000 cases of sweet potatoes available at any price, and for shipment the market is quoted at $1.60 to $1.75 for standard 3s and $5.50 for 10s, f. o. b. cannery. Under these conditions, futures should be attractive to the buyers, the market being quoted at $1.20 for fancy 2½s, $1.25 for 3s, and $4.00 for 10s, with standards offered at $1.20 for 3s, and $3.75 for 10s.

Peaches Strong—There is a strong market for California peaches on the spot, and the Coast position is also strengthening. Stocks of peaches, both here and on the Coast, are said to be very light on wanted grades, and interest in futures is consequently growing keener as "the end of the pile grows near," to borrow an expression dear to the hearts of the Baltimore trade.

Trade Items—According to a letter from San Francisco this week, the O'Malley-Collins Co., prominent San Francisco brokerage house, is retiring from business on May 1 next.

The Victor (N. Y.) Food Corporation has appointed the A. C. Clark Co. New York sales representatives.

The Best-Clymer Co., of St. Louis, packers of jams, mince meat, molasses, etc., have opened an office here under the management of Joseph B. Schlechter.

Ed Rinaud, formerly of the canned foods sales force of Butler & Sergeant, Inc., is now with the United States Stores Corporation, and is located at Columbus, Ohio.

Walter Munro, of the sales department of P. E. Harris & Co., well-known Alaska salmon canners and distributors, is visiting the trade here.

C. W. Glick, former manager of the New York office of Mailliard & Schmiedell, has opened a sales office for the Bisceglia Canning Co., in London.

C. A. Van Landingham, well-known tuna and sardine canner, of Los Angeles, is visiting the New York market this week.

W. F. Assau & Co., of Baltimore, have announced to the local trade through Prince, Keeler & Co., that they are sold up on future stringless beans.

Ralph Polk, of the Polk Canning Co., Florida grapefruit canners, was here during the week, visiting W. D. Breaker & Co., Inc.

Music—Here's your vaccination song.
Writer—Whadaya mean, vaccination?
Music—It didn't take.—Reel.

Passenger A—How are you?
Passenger B—First rate; how are you?
Passenger A—Steerage.—Punch Bowl.

CHICAGO MARKET

Jobbers Pleased at Modification of Wisconsin Label Law—Market Active, Demand Crisp—Surplus of Canned Fruits on the Coast Not a Fact—Salmon in Active Demand—Fancy Tomatoes Cleaned Out—Futures Are Selling Slowly—Convention.

Chicago, April 10, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

PLEASED—The Wholesale Grocers of Chicago, and elsewhere for that matter, are greatly gratified at the modification of general order No. 11 by the Wisconsin Department of Markets. This modification permits the labeling of peas in Wisconsin with private labels, even though the private labels do not comply with the requirements of the law as to the printing of grade, etc., on the label.

There is no doubt that the wholesale grocers will eventually see the wisdom of complying with this provision even though they are exempted from doing so, because the lack of information on labels, of canned peas which now exists is so confusing to consumers that there is a demand from consumers that the description on labels be so simplified and made so intelligible that the housewife can buy a can of peas by looking at the label and thereby knowing what she is going to get inside the can.

The Market—The market for canned foods shows spirited activity and there is a brisk demand prevailing for all kinds and varieties of spot canned foods which can be delivered promptly. The trouble, however, is that the demand is difficult to supply on account of the scarcity or shortage of nearly all spot canned foods.

There was an impression that quite a surplus of canned fruits was being carried in California, Oregon and Washington, but investigation has shown that this is not the case, and California has sold out on all high grade canned fruits and is selling out the low gade goods rapidly. There is a little larger proportion of surplus in Oregon and Washington than there is in California, but the excellence of quality of goods that were packed there this last season will shortly attract sufficient trade to close out the output of 1923 before the new or 1924 pack comes on the market.

Salmon—There is a brisk demand for canned salmon in Chicago and the central west, and brokers are busy making up carload lots for shipment from the Pacific coast and in showing samples and negotiating with carload buyers. The demand is chiefly on pink salmon of a cheap seller, but quite a quantity of Red Alaska is being sold both in ones tall and halves flat.

Tomatoes—In canned tomatoes the wholesalers are rather poorly supplied and are trying to buy extra standards for private labels from Maryland and Delaware, but are finding that all the goods offered in those two states for prompt shipment are being sold as standard quality and there are no extra standards to be had. Neither are there any fancy canned tomatoes to be had.

Now and then reserve lots of extra standard or fancy canned tomatoes in small quantities are offered from Ohio canneries or New York canneries, but they are soon absorbed by the market and the offerings are very few and small.

Corn—In canned corn the Far West and Southwest beyond the Missouri River is buying freely and has been paying as high as $1.00 per dozen for full standard canned corn, f. o. b. canneries in Illinois, Iowa and Wisconsin. Prices below that are usually attached to a quality of standard corn that could not be classified as full standard. Some canned corn that could properly be classified as extra standard is being sold by canners at $1.00 per dozen in order to close out their holdings for the season.

Peas—In canned peas the selections offered to buyers just at present from Wisconsin for spot goods are so limited that they are hardly worthy of being quoted. There are a few lots still in the hands of canners unsold consisting of less than carload lots and of qualities that are not very desirable, but now and then an offering of desirable quality is found in canners' hands.

Michigan seems to be entirely sold out on canned peas and New York State is holding the suplus that she has at such high prices that wholesalers do not feel justified in buying them.

Futures—Future canned foods are selling slowly. The wholesalers seem to have contracted for sufficient supplies in canned vegetables in the staple lines to cover their future sales made to retailers, and are buying only as their own future sales to retailers increase, so as to keep covered. The buying of futures this season so far, especially in staple canned vegetables, has been considerable larger than in 1923 at this date and canners are very well satisfied with the situation. This is especially the case with pea canners of Wisconsin, many of whom have withdrawn from offering futures of 1924 pack, having sold all that they safely can contract.

Convention—The Western Canners' Association Convention to be held in Chicago, April 22, 23, 24, Hotel Sherman, seems likely to be largely attended, and of prime importance to canners and distributors. The program will be most interesting. The list of speakers show that many important subjects will be discussed by men of ability. Therefore, a large attendance is anticipated.

Special one and one-half fare railroad rates have been secured from all parts of the country.

Altogether the canned foods season for 1923-24, which is now drawing to a close, seems to have been thoroughly satisfactory to canners and to distributors. The prices at which the various articles in canned foods opened have been pretty generally adhered to. There have been but few advances over the opening prices and scarcely any declines. Therefore, it may be said that we have had a steady market and that anyone who failed to make a fair profit on sales, whether canner or distributor, has not availed himself of the possibilities of the season.

ST. LOUIS MARKET

Continues Quiet—Scarcity Making All Spots Firmer—A Unique Reason for Lower Prices—Peas Selling Only from Second Hands — But Little Being Done in Tomatoes—Better Corn Firmer—Spinach Held With Confidence — More Interest Is Shown in Fruits.

St. Louis, Mo., April 10, 1924.

By "Missourian."
Special Correspondent "The Canning Trade."

QUIET—Business in canned foods has been rather quiet the past week. With the limitation of supplies both at packing centers as well as in the hands of distributors, a firmer tone in prices prevails. This is reflected in advancing prices throughout all lines. Vegetables in wanted varieties are particularly scarce. In consequence of the enlarged retail demand there has been more interest shown in futures. It is reported but cannot be confirmed, that several big contracts in peas and corn have been placed. Spot stocks are being called on to take care of distributing needs. Jobbers are not over-burdened with staples so they require pickups and larger sized parcels to take care of their trade. They prefer to buy as they require the trade and not in speculative blocks. The policy of conservative buying has been so successful during the past year, that there is a general inclination to operate along the same lines in the immediate future.

Distributors are trying very hard to discourage advances in prices. Distibutors say that because of reports of curtailed production on account of frost damage or limited yields because of drouth, instead of advancing prices should lower them, because with fewer cans needed than anticipated, the can companies should be able to shade their prices. High prices are opposed by local jobbers on general principles and particularly so in a presidential election year, and the existing upset industrial and financial conditions.

Peas—As primary points are nearly out of 1923 lines of peas, buyers have to go to second hands and other markets to take care of their requirements, with the closing out of stocks, there is a higher market. Fancy No. 3 Alaskas from second hands, are reported at $1.85 f. o. b. Wisconsin points. Although in the hands of the canner, they are the property of dealers who have not called for their deliveries and the sales are made for shipment, but for the account of the present owner. Extra standards are being taken when it is impossible to get fancy. Cheap peas are nearly out. Future packs are firm, but there is not much business being done, because many dealers have covered and the majority of canners have sold out their anticipated packs. Southern packers have sold up their new packs so extensively that they are not looking for business. The same is true of Wisconsin.

Tomatoes—There is very little being done in tomatoes, as needed spot stocks are taken but little beyond the immediate requirements. Southern lines are coming into the Middle West markets to take care of the local shortages. This prevents can-

ners from being anxious to sell. The main call is for 2s and 3s, Southern and California 2½s. Little is being done in gallons. There is no demand for futures.

Corn—Fancy corn is very scarce, with the best-known brands bringing extra prices. Standards are steady, but there is no shortage. Only a few available lots of fancy corn can be picked up.

Spinach—Those having California and Southern packs of spinach are holding it at recent advances. A shortage in production is looked for in California due to the dry weather and short deliveries are predicted.

Fruits—Best informed dealers say that the unsold part of the 1923 pack of California fruits, is unusually light for this time of the year and popular sellers are short. The future market is unsettled. It is reported that the recent California frosts were greatly exaggerated, but the peach and apricot sections suffered some. This has a tendency to curtail the yield and canners are not trying to sell. Standard cling peaches, apricots, pears and cherries seem to be the most in demand.

Strawberries—Information has been received here that at the last meeting before the planting season of the Springfield Stawberry Growers Association was held at Springfield, Mo., this week, and the acreage checked up. The association, which was organized at Springfield a few months ago, is endeavoring to secure a total of 1000 acres in pledges, which will enable it to ship from Springfield at the rate of ten cars a day during the peak of the growing season. According to the president of the organization the pledges at the present time total 800 acres. This total will assure the shipment of at least several carloads a day during the busiest time of the season. The crop will be handled by the local association co-operating with the Ozark Fruit Growers Association.

The berry growers of the Humansville district, in the same section of the state, are also getting ready for the 1924 season, and will erect a large shed at Humansville at once for assembling the berries. The prospects for a big crop of berries in that section seem to be bright at the present time. It is reported that the big fields in sections south of Humansville were greatly damaged by the dry weather last summer, and that would, indicate that the supply of Missouri berries will be cut down considerably. Between thirty-five and fifty acres will be added to the acreage in the Humansville region this year.

CALIFORNIA MARKET

Peaches Damaged 30 Per Cent—Canning Crop Hardest Hit—Spot Goods Are Advancing—Oregon Withdraws Prices—Prices on Berries and Jams—Rain Has Helped Asparagus—Canning Spinach—Notes.

San Francisco, April 10, 1924.

Special Correspondent "The Canning Trade."
By "Berkeley,"

THE Crop Damage—More definite information regarding the probable damage to fruit crops in California by the frosts of March 220-24 is now at hand, and E. E. Kaufman, Federal crop statistician, reports that instead of the peach crop being damaged to the extent of 80 per cent., as was at first announced, the loss would be nearer 30 per cent. The damage to the clingstone peach crop in Sutter County, where about 40 per cent. of the State's canning peach crop is grown, is more than 50 per cent. Growers in Butte, Yuba and Sacramento counties also suffered losses, but to a less extent. Taking the State as a whole the loss by frost so far is but about 30 per cent., but it is to be noted that the heaviest loss is in the districts where the bulk of the canning crop is grown. Some damage has been done to apricots, but the loss is light in the Santa Clara district, where the greatest tonnage is produced. The pear crop in Sacramento County will be reduced about 30 per cent., but considering the State as a whole the loss by frost is light, so far. Plums in Sacramento County will be about half a crop, but Placer and Solano counties, both heavy producers, promise a good yield. Cherries have been damaged to some extent throughout the State, with the heaviest loss in San Joaquin County, where only half a crop is expected. April was ushered in with light rains and nowhere is there any lack of moisture for immediate needs, although the outlook is not very bright for supplies of water for irrigation.

Advances in Spots—The California Packing Corporation has put out a new spot list with advances on almost every item, the principal price changes being on apricots, cling peaches and pears. Apricots were advanced to $2.40 for No. 2½ choice; $1.75 for No. 2½ standards; $1.50 for No. 2½ seconds, and $1.40 for No. 2½ water. On peeled apricots the advance is 10 cents on standards and 5 cents on seconds and water. The new yellow freestone peach prices are: $2.15 for choice, $1.70 for standards, $1.50 for seconds, and $1.40 for water, all No. 2½s. No. 10 choice, $6.75; standard, $5.50, and water, $4.00. The new prices on yellow clingstones are No. 2½ choice, $2.35; standard, $1.85; water, $1.55, and for No. 10 choice, $7.75; standard, $6.25, and water, $4.50. Bartlett pears, No. 2½ choice, $3.00; standard, $2.75; seconds, $2.60, and No. 10 choice, $9.50; standard, $8.25, and water, $5.50.

Oregon Withdraws Prices—From Oregon word has been received that some of the canning interests which came out early with tentative prices on fruits have withdrawn these, owing to the unsettled crop conditions in California. Packers in California will not announce opening prices until the size of the fruit crop can be more accurately determined than at present and until costs can be estimated.

Prices on Berries and Jams—Libby, McNeill & Libby have come out with opening prices on berries and on jams. These are as follows:

No. 2 Blackberries	$2.10
No. 2 Fancy Blackberries	2.35
No. 2 Loganberries	2.10
No. 2 Fancy Loganberries	2.35
No. 2 Strawberries	2.35
No. 2 Fancy Strawberries	2.95
No. 2 Raspberries	2.90
No. 2 Fancy	3.10
No. 1 Apricot Jam	2.45
No. 1 Blackbery Jam	2.45
No. 1 Loganberry Jam	2.45
No. 1 Peach Jam	2.45
No. 1 Raspberry Jam	2.90
No. 1 Strawberry Jam	2.90

These prices are for shipment from Oregon canneries. For shipment from California points 7½ cents is to be added to No. 2s and 5 cents to No. 1s.

Asparagus—The recent rains have been of great value to the asparagus crop and packing is now in full swing. A splendid quality of grass is coming into plants and a large pack is promised if spring showers continue. The heaviest selling items in the lists of most packers have been sold up for some time, but some packers may be in the market later with offerings. Canners are paying about six cents a pound for canning stock in the open market.

Spinach—The packing of spinach is under way in many places, but the run will be short. The acreage was reduced from early estimates by the drought and the yield is light in many districts. The Pacific Pea Packing Company is making a pack at Oakdale and the California Co-Operative Canneries is handling spinach at its Modesto plant.

Coast Notes—The California Co-operative Canneries, 503 Market Steet, San Francisco, is offering an issue of $1,000,000 of eight per cent. cumulative preferred stock at par. This concern, of which Albert Haentze is president, was incorporated in 1919 to take over the business of the Producers Warehouse Corporation, at San Jose. In addition to the large plant at San Jose it operates canneries at Visalia and Modesto. The proceeds of the stock issue now being made will be used exclusively to liquidate present mortgages and to supply working capital.

The California Packing Coporation has opened offices at 260 Broadway, New York, with C. A. Lumb, formerly of San Francisco, and recently an official of the J. K. Armsby Company, in charge. Mr. Lumb has been given the title of division sales director for the Eastern territory, which includes the New England States, New York, New Jersey, Maryland, the District of Columbia, Pennsylvania, Delaware, Virginia, West Virginia and North Carolina. R. M. Barthold, vice-president of the California Packing Corporation and director of sales, states that the new office will be a connecting link between the Eastern district and the main office at San Francisco and that there will be no change in the present plan of distributing through brokers. E. F. Chamberlain has been appointed manager of the New York office of the J. K. Armsby Company to succeed Mr. Lumb.

At a recent meeting of the board of directors of the Alaska Packers' Association held at San Francisco, Roy L. Pratt was chosen to replace C. V. Griffin, resigned.

Joseph Durney, of the Griffith-Durney Co., San Francisco, left recently on a hurried trip to New York, Philadelphia and Chicago. Raymond Durney, who has charge of the Los Angeles branch of this concern, is making a trip to New Orleans and the Southern States, and Harold Durney is away on a trip on which he will cover the principal cities of the country.

S. P. Sanford, salesmanager of the F. E. Booth Company, San Francisco, recently visited the trade in New York.

Charles E. Wilcox, buyer of canned fruits for Sprague, Warner & Co., Chicago, was a recent business visitor at San Francisco.

A disastrous fire swept Ketchikan, Alaska, on March 30, and salmon packers express the opinion that the disaster will have an effect on the salmon fishing industry, since many fishing expeditions are outfitted there every spring.

Four grocers' associations, three in California and one in New York, more than fifty grocery companies and forty-one individuals scattered through California, have been named as defendants in a suit launched at Los Angeles, Cal., charging agreement to fix uniform prices, terms, discounts and policies. The Associations named are the Southern California Wholesale Grocers' Association, the Southern California Association of Manufacturers' Representatives, the California Wholesale Grocers' Association and the National Wholesale Grocers' Association.

SEATTLE MARKET

More Salmon Buying—Can't Determine a Fair Price on Futures for Salmon—Future Fruits Are Moving—Spot Salmon Moving Strongly.

Seattle, April 10, 1924.

By "Nomlas"

Special Correspondent "The Canning Trade"

MORE Salmon Buying—Demand for salmon has taken a turn for the better during the past week, and stocks are now moving freely from some packers. Increased buying from the jobbing trade in the South and Central parts of the country is a feature of the market.

Some sellers are finding it impossible to consolidate Red Talls with other grades, and are urging their brokers to sort orders so that reds may go out in straight cars.

Futures—The situation in regard to futures is aptly summed up by one packer who says: "We are offering S. A. P. only at present. Neither packer, buyer nor broker is in position to determine a fair price now. None of us can afford to gamble in an effort to outwit the other."

Prices—Remain unchanged in the main. Reds are perhaps a shade firmer as the $2.25 offerings clean up, and the market is drifting slowly towards the $2.35 level where the larger operators have been for some time past. Pinks remain nominally unchanged at $1.25, while the scattering lots of chums still available hold at $1.20.

Working Future Fruits — Northwestern fruit packers are now busy working on future business. Prices have been out for a few weeks now, and the canners are booking a good business on berries. The carryover of 1923 pack berries and other Northwestern canned fruits is extremely light this season, and canners anticipate a heavy volume of business on the 1924 pack.

F. J. Comeau & Co. Sell Out—P. E. Harris & Co. have succeeded to the brokerage business of F. J. Comeau & Co., and have become exclusive selling agents for the Hidden Inlet Canning Co., preparing to pack 50,000 cases this season. The Hidden Inlet Canning Co. "made a hit" with buyers last season when they refunded every buyer of pinks to a basis of $1.20 because they offered others at this price, and felt morally obligated to everyone of their buyers, though not compelled by their contracts to reduce.

Salmon Movement Heavy—According to statistics just compiled by the Pacific Canned Fish Brokers' Association, there were 716,000 cases of salmon shipped out during January and February. With a continuance of this movement, and taking into account the normal increase in consumption during the summer months, many factors her believe it reasonable to expect a clean-up of the entire carry-over by the time the new pack comes down from Alaska.

Washington has been agog over the bill introduced into Congress to restrict salmon catching, and which would heavily curtail the operations of salmon canners, and cause them severe losses. The canners are as keenly alive to the need of conservation measures for salmon as anyone, but they know there is no need of drastic action. As pointed out in this column, the proposed law has many seriously objectionable features. It has been in conference at Washington this week and its progress is being closely followed.

MAINE MARKET

Improvement in Business—Best Months for Canned Apples Are Ahead of Us—Sardines Are Well Cleaned Up—Canners Not Anxious for More Futures—Clam Canning Irregular.

Portland, Me., April 11, 1924.

IMPROVEMENT—Jobbers report another little lift to business during this week, the general tone being a slight improvement over last month. All other lines of trade are quiet, and, of course, this has a deadening effect on groceries and provisions.

Spot goods are so few that they receive little attention from Maine canners. There is still a supply of 1923 corn on hand, but this has begun to move. There may be a few cars of No. 10 apples also held here, but they are not being offered just yet, owing to the fact that there is still fresh fruit on the market, and that May, June and July are good months for selling canned apples. Sardines are pretty well cleaned up. All other lines are entirely out of the market, and there is still a demand for goods.

Futures—Futures have sold well this season. Just at present, and until the spring opens and the planting season is at least nearer in prospect, canners are not anxious to add to their sales of corn. Should first conditions be promising and farmers feel that they can cultivate additional acreage, it is quite possible that further offerings will be put on the market. After a mild winter we are having a tardy spring, and it is discouraging to those who work with crops of any kind. Future corn holds at $1.45 for Early Crosby and $1.70 for Golden Bantam. There has been another increase in the demand for Golden Bantam, and canners are wondering if this variety will eventually displace the good old Early Crosby which has been the standard for so many years.

Stringless beans are practically cleaned up on future contracts at $1.30 and $6.00 for 2s and 10s. It is increasingly gratifying to Maine canners to see this variety of bean grow in popularity, and there is every indication that it will soon rank with corn and blueberries in volume.

The clam pack goes on spasmodically, rushing in fair weather and dull during the stormy days. As we had a blizzard last week and another this week, the work has been rather seriously interfered with. Goods are going to market as fast as produced, and the demand has been very good for both immediate and future shipments. If fair weather predominates, canners will be able to take on a limited amount of business beyond present contracts, but this does depend wholly upon the weather. Clams are still quoted at $1.30.

Lobster prices have been announced by one of the larger canners on a much lower basis than last season. Halves in 1923 sold at $4.75, and have opened this year at $4.25. Other prices are equally reduced, pounds marked at $8.00, picnic size at $5.00 and quarters at $2.32½. The pack is started in a very small way, but not much can be accomplished until about the 25th of April.

George F. Pelham, Eastern representative of the Sprague-Sells Corp. and Peerless Husker Co., is in Maine this week. Needless to say, he is receiving a good welcome and good business—he always gets both.

Mr. W. F. Leonard, of the Leonard Packing Co., is in New York this week.

Mr. and Mrs. H. L. Forhan (H. L. Forhan Co.) have returned to their home in this city after an extended stay in Florida.

DEATH OF WILLIAM A. TEED.

William A. Teed died this week, and services were held at St. Itus Church, Chicago, Wednesday, April 9, 1924. Interment was at Detroit, Mich., his old home. He was for 18 years with the J. M. Paver Co., Chicago, as city and traveling salesman, and previously was with The Dunkley Co., canners of Grand Rapids, Mich.

He was an earnest, cheerful and able business man, and his friends were as numerous as were people who knew him. He had a fine capacity for making and holding friendships and bore the very highest reputation as a man of commendable character. He was a remarkably successful salesman, and the reason is not hard to find, for he was square, truthful, patient and considerate, and loved his fellow-men.

What Canned Foods Distributors are Doing

Wholesale Grocers All Over Country in Arms Against Attempt to Legislate Them Out of Handling Household Remedies—Packers' Consent Decree Again in Limelight—Notes of the Wholesale Grocery and Chain Store Trades.

Wholesale grocers all over the country are in arms over attempts by what they term the "drug trust" to legislate wholesale grocers out of the handling of any types of household remedies, drugs, etc., while the druggists themselves continue to make further inroads into the wholesale grocers' business by handling teas, coffees, spices, jams, preserves, peanut butter, olive oil, salad dressing and numerous other specialties.

Thus far, there has been no concerted action by wholesale grocers in opposition to the attacks by the drug interests; that is, there has been no national action. Individual State Associations, prominent among which are the Virginia Arkansas and the Indiana Associations, have waged bitter fights in defense of the jobbers.

During the past several years there has appeared in the legislatures of many of the States proposed laws, significantly uniform in wording and intent, to deprive wholesale grocers of the right to handle any kind of household remedy or drug. These bills have been strongly indorsed by the drug interests of the country, which all the time have been steadily expanding their own operations into other fields.

For example, in the average "drug store" in the larger cities, the prospective buyer may purchase groceries, hardware, electrical appliances, shoe polish, writing paper, jewelry, sporting goods, cigars, and if the druggist be conscientious he may have a small supply of drugs. It is this class of distribution, taking all that he can grab of everyone's else business, who has been after the wholesale grocers, and the grocery jobbers are now thoroughly awake to the menace.

Wholesale grocers in the South and Southwestern parts of the countries all do quite a business in drugs and household remedies, and if this business were taken away from them through legislation a good part of their volume would be gone.

W. P. Johnson, secretary, of the Virginia Wholesale Grocers' Association, which held its convention last week, in his annual report said:

"Senate Bill 96, relating to the sale of drugs and domestic remedies was amended. If that bill had gone through there is not a wholesale grocer or retail grocer in the State of Virginia who would have been able to sell even a five-cent package of Epsom salts. The druggists wanted to hog the whole thing, and we stopped it. We stopped it first in the Senate committee. We had eliminated from that bill the entire section 1681. After we had that eliminated it got up onto the Senate floor and they got busy with it again and put the whole thing back, so that we had to do our work all over again in the committee on general laws of the house, and when we got through with it there we had a bill, on the whole in better shape than it has been for the past ten years. In other words, we eliminated everything objectionable, the sale was not restricted."

Packers' Consent Decree—Armour & Co. and Swift & Co., two of the packers involved in the famous "Consent Decree" whereby the "Big Five" Chicago meat packers consented to stop dealing in canned foods, dried fruits, and other unrelated lines, recently applied to the Court of Appeals of the District of Columbia for leave to file briefs and to be heard on the argument of the appeal of the California Co-operative Canneries from the order of the Supreme Court of the District. denying the application of the latter for leave to intervene in the Consent Decree proceedings for the purpose of having the decree set aside or modified.

Counsel for the National Wholesale Grocers' Association appeared in opposition and filed objections to the application of the Swift and Armour defendants. The National's objection was based on the ground that Swift and Armour not only had consented to the original decree and at no time appeared in the court to in any way to question the decree, but had not appeared at all hitherto in the proceeding brought by the California Co-operative Canneries and that furthermore the Swift and Armour defendants did not in their application in any way inform the court concerning the purpose or object of their desire to file a brief and take part in the argument.

The Court of Appeals for the District of Columbia entered its order denying the application of the Swift and Armour defendants and thereby refused them leave to file briefs or be heard on the argument of the appeal of the California Co-operative Canneries.

When the wholesale grocers of the country were conducting their campaign to drive the "Big Five" from the wholesale grocery field, some canners sympathized with the "Big Five" who were heavy buyes of canned foods, but there was no active support of either side from the canning trade.

Since the entry of the California Co-operative Canneries into the proceedings it has been repeatedly charged by wholesale grocers that the California organization was little more than a subsidiary of Armour & Co.

Complete Convention Plans—The final meeting of the convention committee of the National Wholesale Grocers' Association was held in Chicago last week.

The 1924 committee is composed of Fred C. Letts, chairman; Thomas W. Balfe, vice-chairman; S. N. Steele; L. M. Steel, Walter Chandler, William D. Dean and C. C. Virgil.

The dates of the convention are May 27, 28, 29 and 30. Headquarters will be at the Congess Hotel.

On European Trip—C. A. Pastene, president of P. Pastene & Co., well-known New York jobbers of canned tomatoes, tomato puree and Italian specialties, sailed this week for a visit to his company's canneries and packing plants at Rome and Naples. Upon his return to this country in June the New York, Boston and Montreal offices will celebrate the 50th anniversary of the company.

Expanding—The Monroe Grocer Co., Ltd., wholesale grocers of Monroe, La., have added $150,000 to their capital stock. The company now has a total investment capital and surplus exceeding a half million. R. J. Edwads is president of the company which maintains branches at Ruston, Rayville, and Bastrop, La.

Europe-bound—Harry Roulston, general manager of Thomas Roulston, Inc., prominent chain store distributors of Brooklyn, N. Y., is on a combined business and pleasure trip to Europe.

A NEW EDITION

OF

"A COMPLETE COURSE IN CANNING"

SOON TO BE READY

Thoroughly and completely revised, in every detail, by the highest authority and leading food technologist of the world.

OFFERED

¶ As the finest, most comprehensive and most authorative treatise ever published on the canning, preserving and pickling of all food products, and for the making of condiments, preserves, frust juices and specialties.

READY ABOUT MAY 1st, 1924.

¶ A HISTORY—There were about a dozen books on canning on the market at the time "A Complete Course In Canning" was first published, 1902; and several have attempted the market since; but they all failed for the same reason: they were either a mere collection of formulae (the times and ingredients) or were too highly technical and scientific for ordinary use. As its name implies, A Complete Course In Canning was written to cover the entire subject, from the building of the cannery, the contracting of the crops, and their procedure through the factory to the warehouse, and in such language as the variest beginner could understand. It was based upon the best proceedure of that day, and in the four revisions since, has been kept well up to the most modern methods. This latest revision brings it not only fully abreast of the times, but rather in advance of them. There is no man in the business but what will find this work welcome visitor to his desk-—a real necessity.

¶ We published some of those other works for the authors and we have known them all, and we unhesitatingly recommend this new edition of "A Complete Course In Canning" as the finest thing ever offered the industry.

The Latest Processes.

You must know what new times and temperatures to use—conditions have changed. Be sure and be safe. This new edition will set you straight and and keep you safe. Formulas for all the new products in cans and glass are included. Order now and it will be mailed you as soon as it comes from the press.

The Foundation of A GOOD LABEL

The design may be beautiful and the inks of the best quality but if the paper isn't right the label will not be right.

A good label must have a good foundation---fine paper. It must be paper that will stay white with age and it must be the right finish for color printing purposes. Also it must have the strength and texture to give maximum production on labeling machines.

We test every lot of paper we receive to make sure that it fulfills all these requirements. We use nothing but the best quality of coated and uncoated papers made for us on our order and always by the same formula.

On this foundation we build---with the taste and skill of long experience---labels that help sell goods.

CONSULT OUR TRADE MARK BUREAU

SMILE AWHILE

Sheem—What are your habits at night?
Heem—Pyjamas!—Jester.

Autoist (to driver)—Some flywheel you have on this car! Big one, isn't it?
Driver—This isn't a flywheel. It's the steering wheel.
Autoist—Oh! Well, it must have been the way you were managing it that made me think it was a flywheel.—Widow.

Employer—I hear you were away ill yesterday, Snooks?
Snooks—Yes, sir.
Employer—You didn't look very ill when I saw you at the races in the afternoon.
Snooks—Didn't I, sir? You should have seen me after the finish of the third race.—Goblin.

"If I only had a golf club," sighed the convict as he looked at the ball on the links.—Black and Blue Jay.

Yearling, at McCall's—I'd like to see something cheap—in a felt hat.
Clerk—Try this on. The mirror is at your left—Whirlwind.

Youthful Lover (at parting)—Will you really miss me now that I am going away?
Her Father (appearing with shotgun)—I won't if you don't start in a hurry.—Tiger.

The watchman in the graveyard approached a figure lying in the grass of the cemetery. He kicked the tramp, who woke up with an injured air.
"What are you doing?" yelled the guardian of the dead.
"Playing dead," answered the weary traveler. "When I am in Rome I do as the Romans do."—Stone Mill.

A sign displayed in front of a church reads: The Rev. Rastus Jones will preach here Sunday, morning and evening; after which the church will be closed for necessary repairs.—Juggler.

Tim—My alarm clock went off this morning at 8:30.
Min—Hasn't it come back yet?—Punch Bowl.

Little Mary—Mama, I don't have to eat this egg, do I? It doesn't smell good.
Big Mary—Mary, how often must I tell you not to complain about your food? Eat that egg!
Little Mary (after a brief pause)—Mama, must I eat the beak, too?—Dodo.

"I don't see where we can put up this lecturer for the night."
"Don't worry—he always brings his own bunk"—Tiger.

THIRTEEN TO ONE

Judge—Prisoner, the jury finds you guilty.
Prisoner—That's all right, Judge, I know you're too intelligent to be influenced by what they say.—Jester.

Tommy—Please, Mister, give me another box of those pills which I got for my mother yesterday.
Druggist—I sure will; but did your mother say she liked them?
Tommy—No, sir; but they just fit my airgun.—Witt.

EDITORIALS

SIGNALS OF DISTRESS—Some lines of industry seem to be hanging out signals of distress, as if business with them were in danger. They may be right, but this condition can find no reflection in the canning industry. Business in this line is buoyant, and the future as bright as anyone could wish to see it. Just another evidence that foods are a good line to tie to. People must eat.

THE CORN BLACK PROBLEM—Among the number of new tribulations which have come upon the canners in recent years, in the way of unaccustomed spoilage—that is, spoilage in which the industry did not seem to be subject in the olden days, but which have just in recent years come to plague the canners—black in corn is not the least. When the careful corn canner found upon opening his cans that the top was coated with smudge, it was enough to give him pause. The bacteriologists and chemists were at once set to work to determine the cause and find the remedy. Practical canners but unscientific men began to blame one thing and another: the can, the copper lining in fillers, the fertilizer used, etc., etc., and a committee headed by one of the most experienced, one of the "best" corn canners in the business, was appointed and went to work in the factory to rout out the enemy. Progress has been reported, but it has not been distinctly in evidence. The machinery man gave the most satisfactory solution—shake the corn and cover it up—but this was not correcting the trouble.

In all this time the N. C. A. Laboratories have been at work searching for the cause and trying to devise a remedy. Now Dr. Bohart presents to the attention of the industry a new lacquer or covering for the inside of the can, intended for corn, and which, in laboratory experiments, has proved its ability to prevent black in corn. From the laboratory standpoint they feel assured of this find, but can the lacquer be made and applied in a large commercial way at a cost which will permit its use, and when so made and applied will the results equal the laboratory experience? That's the question. It may be the answer to the trouble-some question, and it may have to be abandoned and a new remedy sought; but the point that no canner should miss is that the industry is now in a position where it can and does study out its troubles and find a remedy or way around.

What would have happened in the olden days if such troubles as have lately appeared had shown their ugly heads? There was then no means at hand to combat them; the industry had not taken its first step in scientific progress; canners worked, as has so often been said, merely by the "rule of thumb," and would have been paralyzed by such visitations. Verily, we have made progress, and are making great progress, and the end is not yet.

But, on the other hand, no canner can afford to leave all this work to the scientific men, nor to the laboratories. No man wants to live with the doctor in his house all the time. Every canner should use every means to avoid trouble, and to do that he must know the new times, the new processes, the new methods to avoid these new troubles, as well as to improve upon the old styles. No canner is safe in relying upon the old methods in any line of canned foods. Because your grandfather processed the goods in that way and kept them is no warranty that the same process will keep them today. We are in a new day and under new conditions, and these conditions must be known and understood. And this should be done before the new canning season comes around.

NOT BY RESOLUTION—In raising his lance against the "merchandising broker," Frank T. Stare, head of the brokerage firm Grocers Supply Co., of Wausau, Wis., points out, as he is so well able to do, that the evil of the merchandising broker will not be blotted out by resolution of any association, a trick the entire industry shows a very grave tendency to fall into. They meet, they talk, they resolute and go home and consider the whole thing cured. "Well, what else can you do?" asks the man who only thinks he thinks, and always has a willing "aye" ready when the question on the resolution is called for.

Mr. Stare regards the matter in this way:

> The National Food Brokers Association has condemned the practices of THE MERCHANDISING BROKER as unethical. I'm for that. In discussing the ethics of

the brokerage business, with the head of a house who poses as a broker, and who is a member of the association, but who are in reality merchandisers, he said, "hell, there isn't none." I am wondering if this may not reflect the attitude of the merchandising broker generally.

We hear a lot of loose talk nowadays, about the middleman. When writing on this subject nearly 20 years ago, Elbert Hubbard said: "We hear much about the elimination of the middleman, but I have never yet seen a sharp, definite, crystalline defintion of what a middleman is. Technically, a middleman is anyone who stands between the producer and the consumer. But most of the people who use the expression 'middleman' regard him as an animated example of lost motion; a specimen of economic slack."

It must be admitted that there is something fundamentally wrong with our present system of distribution. Any vocation must fill an economic need to justify its existence, else it cannot long survive. "Business is that field of endeavor which undertakes to supply to humanity the materials that life demands," which is just another way of saying "Business is human service." Any unnecessary link in the chain of the distribution of "the materials that life demands" is sheer waste, and waste is fundamentally wrong.

As "in the preparation of hare soup, the first move is to 'catch your hare,'" so in the elimination of the parasite from the system of distribution, the first move is to catch your parasite. Wiser men than this writer have devoted much thought to this subject, and have never been able to detect who is guilty of throwing monkey wrenches into the gears. It is most obvious, however, that the merchandising broker serves no human or economic need. Manifestly, he is "an animated example of lost motion; a specimen of economic slack," a parasite pure and simple. "He toils not, neither does he spin."

Here is one species of the middleman that you can put your fingers on. It is within the power of the producers and the legitimate distributors of food products to very effectually apply the eliminator. Every time a canner or manufacturer sells his products to a merchandising broker, he is both gumming up the cards and delaying the game. He is deliberately imposing an unnecessary cost on the ultimate consumer, thereby curtailing consumption. And by the same token, every time a legitimate distributor of food products buys of one of these parasites, he is deliberately throwing monkey wrenches in the gears of economic distribution. And in the final analysis, both the producer and the legitimate distributor suffer.

It is so obviously foolish, too. If the jobber can afford to pay the merchandising broker a certain price for a product, he can, and will pay the producer the same price. The merchandising broker is a speculator and speculation in food products is a crime against humanity. He is in a position to have advance information on crop and market conditions; usually much more accurate information than either the producer or the jobber. He has no hope of selling his purchases until the producer is cleaned up on his holding. Then he charges "all the traffic will bear."

Resoluting by the National Food Brokers Association will not eliminate him. His attitude is quoted in the opening paragraph of this article. It requires team work between the producer and the legitimate distributor to turn the trick.

THE PITY OF IT ALL.

Here is a clipping from the Wall Street Journal, which might well be the basis for an extended epic on wilful waste, or, better still, a homily on the "saving grace" of the art of preservation in hermetically sealed cans —canning. What could be finer to eat than splendid, fat mackerel, packed in tomato sauce, and kept in cans for all the months of the year? Had a cannery been available to take up this huge surplus of excellent food, the food would not only not have been wasted, but the fishermen would have been paid for their labors, the cost of the upkeep of the fishing boats covered and that industry encouraged to go on, where today no boat cares to put to sea for further supplies and all the fishermen of Gloucester now feel the depression. Let the farmer and grower apply this same lesson when they feel inclined to rail against the canner. The clipping reads:

FREE FISH FOR ALL

Biggest Catch of Mackerel in Years Swamps the Market.

(From the Wall Street Journal)

Mackerel are being given away in old Gloucester, Mass. One day recently a half-million pounds of this fish were brought into the harbor, and on another day 660,000 pounds found their way to the wharves. It has been impossible to take care of all this fish. Down below in the fishing vessels the fish is on ice, but, owing to the size of the catch, the decks have been cluttered with fish knee deep. When the ships have docked all that could be split and salted in a day have, of course, been sold; the rest must be thrown away. Many Gloucesterites have been living on mackerel gratis for sometime.

Those who are too proud to hang around the fishing ships have to pay 25 cents for two pounds, while the fishermen not having enough help have actually had to throw a lot of fish away.

Local fishermen say that there has not been such a mackerel catch in 10 years.

UNITED STATES CIVIL SERVICE EXAMINATION.

Inspector in Salmon Canning.

The United States Civil Service Commission announces the following open competitive examination:

The examination will be held throughout the country on May 21. It is to fill vacancies in the Bureau of Chemistry, Department of Agriculture, at entrance salaries ranging from $1,000 to $2,040 a year, plus the increase of $20 a month granted by Congress. Appointees will be allowed expenses for travel and subsistence when away from headquarters on official business.

Applicants must have completed eight grades of common school; and, in addition, must have had at least three years' experience in a responsible or supervisory position in a salmon canning factory. Credit will also be given for any time the applicant may have spent in work related to the salmon industry, such as work of an inspector in the fish industry or work along the line of curing or processing of fish.

The duties are to determine by a physical examination of the finished product the quality of the raw fish used by the canneries; to aid in the technology of the development of better methods for canning salmon; to make sanitary inspection of canneries and to inspect and grade salmon intended for processing and canning; and various other related duties.

Competitors will be rated on practical questions relative to the duties of the position, and general fitness, education and experience.

Full information and application blanks may be obtained from the United States Civil Service Commission, Washington, D. C., or the secretary of the Board of U. S. Civil Service Examiners, at the postoffice or customhouse in any city.

No man will ever regret the investment of $10.00 in a Copy of the newely Revised Book----

THE CANNING TRADE

BALTIMORE, MD.

Special Enamel For Corn Cans

By E. S. Bohart,

Research Laboratory National Canners Association

Circular No .10-L

A Preliminary Statement

THE only means thus far available for preventing the formation of iron sulfide discoloration in canned corn appears to be by coating the inside of the can with zinc or zinc oxide. The first method suggested for accomplishing this was by means of electro plating the tinplate with metalic zinc. This method at first gave promise of success, and does not prevent corn black when the coating is perfect, but it has been found that the equipment and labor costs involved would probably be too great for its commercial application. Moreover, the amount of zinc dissolved by the corn, although very small, is materially greater than that dissolved from the wax and gum coatings described below.

Attention was next directed to the use of special lacquers or coatings containing zinc oxide suspended in waxes or waxlike substances. Such coatings appear to permit the hydrogen sulfide formed in processing the corn to combine with the zinc oxide, and at the same time prevent an appreciable amount of zinc from being taken up by the corn.

The experimental work on this subject has now reached such a stage that we are able to suggest several coatings that accomplish the desired result. These are therefore suggested, together with such information as we have regarding their application, with the hope that all can makers will study these and similar coatings and work out their practical application in the manufacture of cans. It is believed that the most rapid progress can now be made through diversity of effort by different can companies, each applying its individual ideas in working out the practical application of the method suggested. In the meantime the Research Laboratory will continue its study of this subject with the hope that still better combinations may be suggested than those given below.

Characteristics desired.—In order to give the best results these coatings should be

1. Tasteless.
2. Colorless.
3. Insoluble in corn.
4. Sufficiently tough to withstand abrasion in the manufacture of cans.
5. Sufficiently "short" to permit spraying or application to the plate by other means in a solution of relatively high concentration.

Substances studied.—The following substances have been used either singly or in mixture for the preparation of coatings studied in the experimental work. Chicle gum, gutta-percha, paraffin, copal, rubber, damar gum, carnauba wax, cumar, and beeswax. Some of these materials were found to be unsuited to the purpose, and were discarded after a trial. Damar gum, for instance, imparted a bitter flavor to the product. Paraffin failed to adhere well to the can during processing. Rubber appeared to soften the coating, and thus make it more susceptible to abrasion in manufacturing the cans. Some method of overcoming this influence may be developed, but no such procedure has yet been suggested. Manila copal and carnauba wax could only be employed in small amounts in solutions used because of their low solubility in carbon tetrachloride. Perhaps a better solvent or mixture of solvents may be found which will make these products available.

Combinations suggested.—All mixtures tested of insoluble waxes and gums containing zinc oxide have been found to be practically equally serviceable for the prevention of corn black. Undesirable qualities of particular substances are given above as far as we know them. The following mixtures were selected as a result of the trials of a large number of mixtures of individual waxes and gums on a small scale, and have been subjected to trials in large experimental packs.

1. Cumar, 10 parts and zinc oxide, 5 parts.
2. Cumar, 18 parts, gutta-percha, 4 parts, and zinc oxide, 11 parts.
3. Cumar, 18 parts; chicle gum, 4 parts, and zinc oxide, 11 parts.
4. Carnauba wax, 1 part; chicle gum, 1 part and zinc oxide 1 part.*

In making up these mixtures the cumar, chicle gum, and gutta-percha were dissolved in about five parts by weights of carbon tetra-chloride. After complete solution, the zinc oxide was stirred in, and the mixture was passed through a paint mill twice in order to grind the zinc oxide finely enough to keep it in suspension. Carbon tetrachloride was then added in sufficient amount to reduce the total solids present (including gums, waxes, and zinc oxide) to five per cent. The mixture was applied with a spray to No. 2 can covers, which were then dried about 40 minutes at 110 degrees F. After drying the covers were lined with paper gaskets.

More concentrated solutions did not spray well, as stringiness developed. No experimental work with roll coating of sheets has been done. The mixtures described above give the best results that have been obtained in experimental packs.

All coatings used and described above softened or melted during corn processing, but being in a thin film the coatings did not run or become unsightly. Scratches or abrasions would, however, fill up, and possibly this will account for the fact that these coatings gave considerable protection against corn black, even when applied without zinc oxide.

Subsequent studies in the laboratory have led us to believe that these coatings can be further improved by increasing the amount of gums and waxes in proportion to the amount of zinc oxide, and by drying at a higher temperature. It will be noted that the mixtures described above contain about half as much zinc oxide as of gums and waxes. It is now believed that fully as much protection will be secured, and that the amount of zinc dissolved by the corn will be substantial-

*Coating No. 4 was made and tested only in the laboratory but looks promising.

ly less, if not more than one-third as much zinc oxide as of waxes and gums is employed. This would change the above formulae so that No. 1 would contain 3 1-3 parts, and Nos. 2 and 3 would contain 7 1-3 parts of zinc oxide.

It is found also that drying at a higher temperature makes the coating substantially tougher and thus doubtless reduces its abrasion by the can making machinery, and probably reduces the amount of zinc dissolved by the corn. These observations on drying have been made on laboratory samples only. Tests should be made with temperatures up to 300 degrees F. for various lengths of time. It is suggested that in coating the ends of the cans about 48 milligrams of coating, including 12 milligrams of zinc oxide, be applied to each end.

If a method is developed for coating the flat sheets of plate before the ends are stamped out, this amount is equivalent to 62 ounces of coating (including 15½ ounces of zinc oxide) per base box. It is probable that as a result of future work it will be found satisfactory to add materially less of zinc oxide than the amount suggested. It may be found practicable and advisable to coat the bodies of cans as well as the ends. In that case further experimental work will be necessary to determine whether the bodies should be coated with the mixtures mentioned above, or whether the amount of zinc oxide can be reduced proportionately in both bodies and ends.

Solubility of zinc in contents.—A considerable number of samples of canned corn from various sources has been examined in the laboratory and found to contain from 0.5 to 10.0 milligrams of zinc per can. It is not known how much of this was in the corn originally, and what proportion was taken up from canning machinery. A sample of corn in the husk, however, obtained in the Washington market was found to contain 6.3 milligrams of zinc per kilogram. This is equivalent to about 3.7 milligrams per can. The following table shows the amount of zinc in certain lots of canned corn that were examined in the laboratory, and the amount found in the contents of ordinary cans and of cans whose ends were treated with the coatings described above. In all cases this corn was processed 80 minutes at 250 degrees.

Table I.—Amount of Zinc Dissolved From Wax Coatings

Kind of coating used	Mg. zinc in corn before canning	Mg. zinc per can found in corn	Mg. zinc left on cover	Mg. zinc left on bottom	Mg. zinc on both ends	Net mg. zinc dissolved by corn from coated ends	Percent zinc in coating dissolved by corn
Cumar	3.0	16.3	13.2	21.4	34.6	13.3	28
Cumar	3.0	7.8	18.9	15.0	33.9	4.8	12
Cumar	0.5	4.9	3.5	2.8	6.3	4.4	41
Cumar	2.1	4.7	....	....	1.9	2.6	58
Cumar and Gutta Percha	3.0	7.5	18.2	12.2	30.4	4.5	13
Cumar and Gutta Percha	0.5	3.1	2.2	0.4	2.6	2.6	50
Cumar and Gutta Percha	2.1	2.2	....	....	0.8	0.1	11
Cumar and Chicle Gum	3.0	8.8	12.0	11.9	23.9	5.8	20
Cumar and Chicle Gum	3.0	10.6	9.6	14.3	23.9	7.6	24
Cumar and Chicle Gum	0.5	2.3	2.0	5.2	7.2	1.8	20

Four sets of analyses are shown from there separate packs put up during the canning season of August and September, 1923, and opened for analysis about January 1, 1924. The first column describes the coating. The second column shows the amount of zinc in the contents of uncoated tin cans, and thus gives the amount of zinc originally in the corn packed in cans with coated ends. The third column shows the amount of zinc found in the corn packed in cans with coated ends. The fourth, fifth and sixth columns show the amount of zinc on the cover of the can, on the bottom, and on both top and bottom, respectively. In this connection it should be stated that the cans were stored on end with packer's' end up. The figures in the seventh column were found by subtracting those of the first from those of the second column. They show, therefore, the amount of zinc dissolved by the corn from the coated ends.

It will be seen that this varies from less than a milligram in a can with a very light coating, to 13 milligrams in a heavily coated can. Considering the figures given in this column in relation to the amount of zinc in the coatings of the ends, it would appear that if the cans had been coated by the methods employed in such a way that each end would carry 12 milligrams of zinc oxide (9.6 milligrams zinc) the corn would have taken up not in excess of 6 milligrams of zinc per can. It is believed that this amount would be reduced substantially by using a larger proportion of waxes and gums to zinc oxide, and by drying at a higher temperature as suggested above. The last column of the table shows the per cent of zinc oxide dissolved from the two ends by the corn.

Table II.—Summary of Data, Table 2.

Average amount of zinc dissolved from all coatings.....	22%
Average amount of zinc dissolved from heavy coatings.....	20%
Average amount of zinc dissolved from light coatings.....	38%
Average amount of zinc dissolved from all cumar.....	25%

Growing Peas For The Cannery

By H. STRYCKER MILLS.

Talk Given at Canning School, Ithaca, N. Y., March, 1924

THERE seems to be eight problems which are the most important in growing peas for the canning factory. These are: 1. Poor germination of seed. 2. Rotations. 3. Preparation of the soil. 4. Kind of fertilizer. 5. Quantity of fertilizer. 6. Fall vs. spring plowing. 7. Date of planting. 8. Quantity of seed. 9. Varieties.

Poor Germination—Poor germination may be due to the seed itself or to poor conditions at or after the time of drilling the seed.

One can tell poor seed by the color. It is dark and dull in color, sometimes spotted, and does not look bright like good seed.

It is always advisable to make at least a simple germination test of each lot of seed. Place a piece or moistened blotting paper on a plate or saucer. Count out 25 seeds, taking them as they come from the bag, and put them on the blotting paper. Place another piece of moistened blotting paper over the seeds, another plate or saucer over the top, and put in a warm place. Keep the blotting paper moist until the seed germinates in several days.

By testing the seed in this way, you will get some idea of its germination qualities and will therefore be able to advise growers as to the quantity of seed to sow per acre. Of course, if the germination is poor, then heavy sowing will be necessary.

Poor germination may also be caused by poor conditions at or after the time of sowing the seed. It is harder for seedlings to break through a heavy soil crust than it is for a lighter soil crust. The soil may be packed down too much by excessive rolling or improper harrowing.

The seed may be planted too deep. Two to three inches is deep enough. Last year, in examining a field of peas affected with root rot, a Cornell plant pathologist found that there was more root rot where the seed was planted deep than where the seed was nearer the surface.

Another reason for poor germination is poor weather conditions at time of sowing. If the weather is too wet and cold, the chances are that the seed will rot in the ground.

Rotations—The general rotation in which peas are grown is as follows: A cultivated crop followed by peas. Seeding may or may not be drilled with the peas. If not seeded, the peas are followed with wheat which is seeded. If peas are seeded, alfalfa or clover is usd as the seeding. After the wheat, hay is cut for 2 or 3 years, the sod being plowed for the cultivated crop.

Results in this state seem to show that the best yields are obtained when peas are grown after a cultivated crop. For example, the average yield of peas when grown after cultivated crops, such as corn for grain, potatoes, or cabbage, was 2,321 pounds of shelled peas per acre. When grown after small grains, such as wheat, oats, or barley or peas, the average yield was 2,072 pounds of shelled peas per acre. When grown after alfalfa or other hay, the yield of peas was only 1912 pounds per acre.

There seem to be good reasons for the difference in yields of peas following pea crop.

Sometimes the question is asked why the yield of peas after buckwheat is generally poor. While we have no actual experimental experience to quote from, it is the general opinion of authorities that this is due to the fact that the stubble of buckwheat is very woody, and that the crop is grown late in the season. The woody stems do not have the opportunity to rot sufficiently and, as peas are generally planted early the next season, poor yields of peas are the result. Buckwheat would not be so apt to depress the yields of crops which are planted later than peas.

The question of quack grass and mustard eradication often comes up in connection with the question of rotation.

Quack grass is best controlled by thorough cultivation and partially fallowing the land. Sometimes it

LANDRETH'S SEEDS

is necessary to grow a smother crop like buckwheat or millet.

Mustard is kept down by control in the previous cultivated crop. There is another good reason why small grains or hay should not precede peas in the rotation.

Preparation of the Soil—The preparation of the soil is so complicated by various factors that no cut and dried rules can be given. However, this is an important consideration, and it is necessary to state that thorough preparation is essential if good results are to be expected. Peas require a well-prepared seed bed, the soil must be compact but not rolled so hard that the seedlings cannot break through If heavy rains follow the drilling of the seed and pack down the soil considerably, it may be advisable to go over the ground lightly with a spike-tooth harrow to break the crust. Some growers follow this practice with great success.

Kind of Fertilizer—In general, it may be stated that on most New York soils, phosphorous is needed more than any other plant food as nitrogen and potash are furnished in sufficient quantities in the general rotation in which peas are grown. Poorer soils may require in addition to the phosphorus, some nitrogen or potash or all three plant foods.

The pea is primarily a seed crop which needs large quantities of phosphorus. Leaf crops require large quantities of nitrogen. Further, the pea requires only a short growing season and so does not need much nitrogen applied to the average soil.

Results from the survey show that growers who use complete fertilizers on the average soils on which peas are grown in New York, do not get any increased yields over those using only 16 per cent. Acid Phosphate. Further, those using complete fertilizer do not get increased yields enough over those not using any fertilizer to pay for the fertilizer used.

Quantity of Fertilizer—In general, on farms where peas are grown, 200 or 300 pounds per acre is sufficient quantity of fertilizer for the crop of peas. Peas have too short a growing season to be able to use large quantities of fertilizer. Of course, the poorer the soils, the more fertilizer can be used to advantage.

The survey shows that those growers who did not apply any fertilizer had an average yield of 1,994 pounds of shelled peas per acre, those who used on an average of about 150 pounds of fertilizer per acre, had an average yield of 2,106 pounds of shelled peas per acre, those who used 200 pounds of fertilizer per acre, an average yield of 2,304 pounds of peas per acre, while those who used above 200 pounds of fertilizer per acre, did not get any increased yields of peas over those applying 200 pounds.

Fall vs. Spring Plowing—There is more benefit from fall plowing a heavy soil than there is a light soil. The weathering action during the winter helps to break up the heavy soil which is not of such great benefit to the lighter type. However, the whole question of plowing is largely a matter of considerations of the waether. If the fall is favorable, a large amount of land may be plowed in the fall, if not, then the plowing has to wait until spring. Fall plowed land can be worked and planted earlier in the spring, but this early planting can, I believe, be carried too far.

Date of Planting—While peas are a cool season crop and will stand some cold weather, I believe it is possible to plant them too early. Figures from the survey show that for the year 1920 those growers who drilled their seed before the fourth week in April, had poorer yields than those drilling after that time. Those growers who planted their wrinkled peas after the fourth week in April did not get as good yields as those who planted during the fourth week of April.

The first part of the season of 1920 was very cold and wet so that the seed planted prior to the fourth week in April was held back, and the plants, which lived never attained proper growth so that their yields were curtailed. Further, the wrinkled peas require rather a long growing season. While the season prior to the fourth week in April was unfavorable, the fourth week was favorable, and so growers planting the wrinkled peas at that time had the best yields For every week lost in planting after the fourth week of April, there was a loss in yield of from 100 to 400 pounds of shelled peas per acre.

Quantity of Seed—The usual rate of planting is about 4 bushels of pea seed per acre. Some growers drill at the rate of about 4½ bushels per acre. According to the survey results, those drilling at this greater rate, increased their yields 300 pounds per acre over those drilling only 4 bushels of seed per acre. Those drilling over 5 bushels of seed per acre did not increase their yields.

In drilling larger quantities of seed, it is sometimes necessary to drill both ways in the field. This gives a more even distribution of the seed.

Varieties—There are a great many varieties or so-called varieties of peas grown for the canning factory The most important ones in this state in the order of their date of maturity are: Alaska, Surprise, Admiral, Advancer and Horsford Market Garden. Some new varieties which show promise are: Rice No. 330, Horal and Duke's Delight.

GROWING SWEET CORN AND BEANS FOR THE CANNERY

By H. Stricker Mills.

Talk given at Canning School, Ithaca, N. Y., March, 1924,

WHILE sweet corn and beans for the canning factory are not as important as peas in this state, it seems necessary to cover a few of the most essential topics in discussing the two crops.

Sweet Corn—Under this crop, the most important topics are: 1. Date of planting. 2. Fertilization. 3. By-products. 4. Varieties. 5. Handling.

Date of Planting—While on work on date of planting sweet corn has been done in this state, some results secured in Maine may be of interest. It was shown that early planting gave the largest yields. Corn planted May 25th to 31st yielded an average of 3,233 pounds per acre, that planted from June 1st to 10th an average of 2,441 pounds per acre and that planted after June 10th an average of 1,932 pounds per acre.

Fertilization—Unlike peas, sweet corn is a long season crop, is more leafy, and can, therefore, use larger quantities of plant food.

Most successful growers use manure and 16 per cent. acid phosphate on their land for sweet corn. Figures from the survey show that the growers who used the most manure, 6 to 8 tons per acre, and the

most fertilizer, mostly acid phosphate, about 200 to 300 pounds per acre, had the highest yields and the highest profits.

Figures from Maine show that about 10 to 15 tons of manure per acre applied to sweet corn gave the greatest gains, although higher applications of manure increased yields, but did not pay for their application.

Some farm bureau tests in Erie County in 1922, show that acid phosphate gave the best yields of first grade corn, and the best value of first above the cost of the fertilizer. In this test, 2-8-10 and 2-12-2 fertilizer was compared with no fertilizer plots and acid phosphate plots.

Some very interesting information is contained in Iowa Extension Bulletin No. 71. It is claimed by the writer of that bulletin that sweet corn does not exhaust the fertility of the soil as much as does field corn. In the table given, sweet corn is figured at a yield of 3½ tons per acre and field corn at the yield of 60 bushels per acre. With such average crops, sweet corn removes from the soil 32 pounds of nitrogen, 2 pounds of phosphorus and 14 pounds of potash. Field corn removes 59 pounds of nitrogen, 9 pounds of phosphorus and 11 pounds of potash.

It must be borne in mind, however, that most soils in New York are more deficient in phosphorus, and so would respond more readily to applications of acid phosphate than any other fertilizers as the tests in Eric County, mentioned before, will show.

It has been known for some time that the processes of filling out and ripening a crop bring about the heaviest drain upon the soil fertility. Sweet corn is picked before this heavy drain on the soil takes place while field corn is ripened on the plant, and thus drains the soil considerably more. Field corn, therefore, takes more nitrogen and phosphorus than does sweet corn, but sweet corn takes more potash than field corn. This is because potash is directly associated with the development of sugar in the sweet corn.

Silage—In growing sweet corn for the canning factory, the first question is whether the crop is profitable from the standpoint of the corn itself. The question of the silage, which is merely a by-product, is a secondary consideration. If the refuse from the sweet corn factory can be profitably hauled back to the farms, mixed with the sweet corn stalks, and put into the silo, a good silage will result. The resulting silage would be a mixture of cobs, nubbins, hard ears, husks and stalks.

In Iowa Extension Bulletin 71, mentioned before, Irwin claims that sweet corn silage has a very high value. He claims that the stalks are sweet, palatable and contain less crude fiber and hence a higher percentage of digestible matter than field corn. He does not state whether the ears are included in the silage.

Varieties—There seems to be a tendency toward the growing of smaller grained types of sweet corn with the gradual discontinuance of the Stowell's Evergreen, which was the standard.

There seems to be four types required and grown in New York at this time. These are: The Golden type, an early white like Crosby, a narrow-grained white variety, and a medium late white variety. Golden Bantam is noted for its quality. Improvements over Golden Bantam which deserve a trial are Whipple's New Yellow and Buttercup. Whipple's Early is an improved early white variety and also deserves trial.

The Evergreen types, in general, are too late for New York conditions. Some varieties and strains of medium late white corn which deserve trial are: Early Evergreen, Hickox Improved, Howling Mob, Mimms Hybrid and White Evergreen. From these, a medium late white corn might be selected, which would be better than Stowell's Evergreen for New York conditions.

Handling—It is important to get the corn into the cans as quickly as possible after harvesting. Of course, it is quite evident that some delay may be necessary but do not store the corn in large piles over night as heating will take place with a resulting loss of sugar.

Some experiments have shown that there is a 2 per cent. loss of sugar per hour in corn stored at 86° F., and only 1 per cent per hour when stored at 68° F. Loss in sugar is accompanied with loss in tenderness and quality.

Beans—This crop is usually used as a filler in between the early crops and the later ones. For example, they may be grown to fill in betwen peas and sweet corn or betwen peas and tomatoes. The nature of the crop, therefore, makes it of less importance than peas, sweet corn, and tomatoes, and, in most cases, the canning factories grow most of the beans which they can.

Three topics of interest might be mentioned at this time: Quantity of seed, fertilization and diseases and insects.

Quantity of Seed—The usual rate of planting seed is a bushel to the acre. From work done by Gillis at Cornell the last two years, the indications are that for the three types of beans, Valentine, Burpee's Stringless Green Pod and Refugee, the best rate of spacing is 9 bean plants per foot. With this spacing highest yields were secured, and although, of course, the stand will greatly depend upon the germination and vigor of the seed planted.

Fertilization—The average grower of beans generally applies 200 to 300 pounds of 4-8-4 fertilizer along with 7 to 8 tons of manure per acre. On the generally fertile soils used for beans in New York, this should be sufficient.

Diseases and Insects—It is not my purpose to review this subject at this time, but, as Dr. Burkholder was probably too modest to mention it, I want to call your attention to a very excellent Cornell Extension Bulletin, No. 58, which covers this subject very satisfactorily.

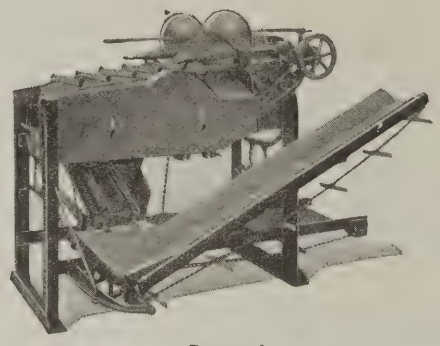
Hedstrom Automatic Compound Drying Machine

THE Hedstrom Automatic Compound Drying Machine employs a new and unique method for drying the compound applied to sanitary can ends. On account of its extremely simple and compact construction, this Dryer is sure to be of great interest to all makers of sanitary cans. The complete machine requires a floor space of only two feet square and is a decided improvement over the large, cumbersome machines now being used for this purpose.

The can ends are individually fed and slowly rotated through the drying chamber, insuring an even distribution of compound during the drying operation. The Spiral movement of the ends creates a natural agitation of heated air in the chamber, so the compound is thoroughly dried, absolutely free of blistering, with a surprisingly small amount of heat.



The machine as shown, was exhibited at the Canners' Convention and was considered the most unique and satisfactory Drying Machine ever offered. The Dryer is operated in connection with our No. 1 Single Spindle Compound Applying Machine, but when equipped with the necessary attachments may be used with other types of Applying Machines.

Write us for further particulars.

PUYALLUP ASSOCIATION TO AGAIN CAN

President W. H. Paulhamus Writes of the New Plans, Quality and Fill to Mark Their Products.

You will be interested in learning that the Puyallup & Sumner Fruit Growers Association has decided to re-enter the canning business and we will again pack a portion of our bush berries and other fruits for distribution in cans.

You will recall the Puyallup & Sumner Fruit Growers Association originated the solid pack of berries in the Pacific Northwest a number of years ago.

This Association consists of several hundred berry growers associated together for the purpose of marketing, in a co-operative way, their fruit products. The Association not only looks after the marketing, but also takes charge of planting, cultivation, fertilization and the picking of the berries.

So that you may appreciate the volume of business conducted by this organization, it is only necessary to advise that during the shipping season of 1923, 131 carloads of blackberries, passenger train service, were shipped and marketed in all sections of the United States. Carloads of blackberries for fresh consumption were shipped as far east as Boston, New York City, Philadelphia, Pittsburgh, Buffalo, Detroit and other large cities east of the Mississippi River. Carloads of red raspberries were also shipped for fresh consumption beyond Chicago.

This will indicate to you that the bush berries produced by the members of our organization have the TEXTURE TO GO THE ROUTE. Berries grown in fields lacking proper cultivation and fertilization are deficient in quality and flavor. The business of our Association was originally that of marketing for fresh

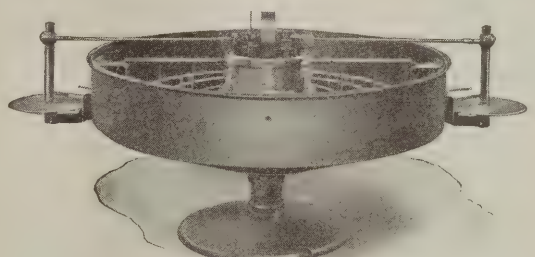
QUALITY



SPRAGUE-SELLS AERO TOMATO WASHER

Employs a brand new principle for thoroughly cleansing fruits and vegetables---vigorous agitation by means of an air blast injected into the bottom of the tanks. Positively no bruising.

SPRAGUE-SELLS SCALDER AND WASHER

The ideal continuous tomato scalder, and a wonderful washer for berries, spinach, celery, etc. Powerful steam and water sprays located both above and below conveyor. Sturdy---Substantial---Reliable.

PEERLESS ROTARY EXHAUSTER

The Exhauster De-Luxe. Most economical in steam. Greatest capacity in smallest floor space. Absolute freedom from jamming, slopping and spilling. Strong, sturdy and substantial. Built to last a lifetime. Install a Peerless and forget your exhausting troubles.

consumption, therefore the necessity of handling our crop with extreme care. If our berries are grown, harvested and can be marketed at points from 3,000 to 4,000 miles from the fields, you can appreciate that they must have quality.

Up to 1917 the association was packing in cans very extensively, at which time they disposed of their canning plants to the Puyallup & Sumner Fruit Growers Canning Company, an organization created solely for the purpose of operating a canning factory, but during the financial troubles of 1920, the canning company ceased to operate, but the Puyallup & Sumner Fruit Growers Association has been in active operation continuously for more than 25 years under the same management.

During the past few years, the association has been marketing all varieties of berries in barrels and selling a large volume of berries to canning companies, but, commencing this year, the association has decided to start canning again and has accordingly arranged for the use of a plant to pack our berries according to our former standards.

You will recall that the Puyallup & Sumner Fruit Growers Association inaugurated the packing of berries to the full capacity of the can. You will also remember that prior to the activities of the Puyallup & Sumner Fruit Growers Association in the canning industry, there was no real standard for canned berries. In fact, what was available at that period was mostly "water-in-the-can." Our association put so many cultivated Evergreen Blackberries in the can that when it was opened and the tin removed, the blackberries would be left standing erect similar to cheese.

Our theory is that the more berries we can put in a can, the less cans it will be necessary to buy, and with this idea in view, we will fill every can to capacity. You want the best canned foods that are available. We believe that our association can supply your requirements with this kind of a product. You may be able to purchase red raspberries, blackberries, gooseberries, loganberries, strawberries and other similar bush fruits at a lower price per dozen cans than we can afford to sell for, but the jobber who serves his customers with the best product is the jobber who retains his business.

Our association purchases all the fertilizer for our members in large volume, and this fertilizer is selected with a view of giving the best possible texture to the berries, and is applied to the fields in an intelligent manner. The president and general manager of our organization is one of the large growers of the valley. He established the industry and is entirely familiar with the requirements necessary to produce the best quality of fruit.

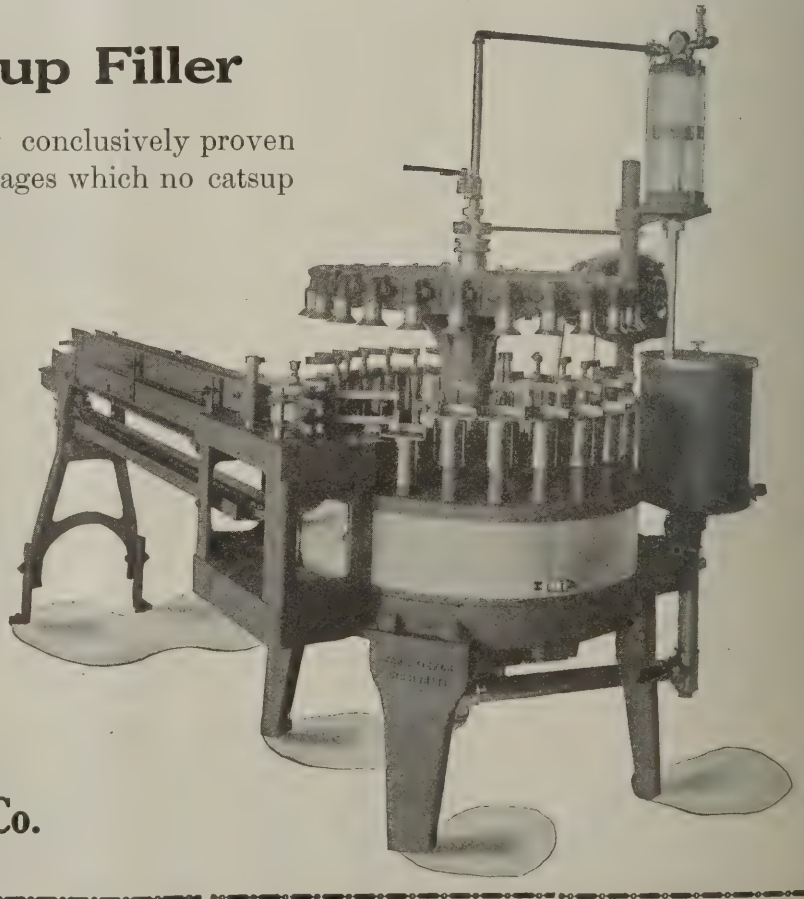
You know the reputation of the berries packed by the Puyallup & Sumner Fruit Growers Association. If you are interested in quality of this kind, we can take care of you.

For this year most of our strawberries are already contracted in barrels, but we will pack a few in cans on orders. We can take care of your requirements of Cuthbert red raspberries, loganberries, cultivated evergreen blackberries, gooseberries, Montmorency red sour pitted cherries, strawberry rhubarb, and will also pack reasonable quantities of Bartlett pears, Royal Anne cherries, prunes and apples. Our friends in California are strong on peaches and apricots, but when

The Kiefer Catsup Filler

The new Kiefer Catsup Filler, having conclusively proven its worth last season, presents advantages which no catsup bottler can afford to overlook.

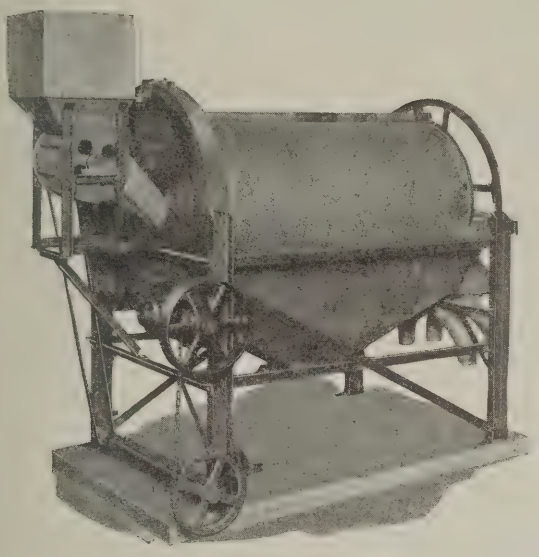
It fills without slop or waste and will not deposit catsup in broken bottles.



There is no perceptible loss in temperature when filling.

Metal contact is reduced to a minimum.

Nothing to take apart when cleaning at the end of the day's run.



We are willing to prove these things to you in your plant. Many manufacturers have already placed their order for this season.

Get your order in before it is too late.

The Karl Kiefer Machine Co.
Cincinnati, Ohio.

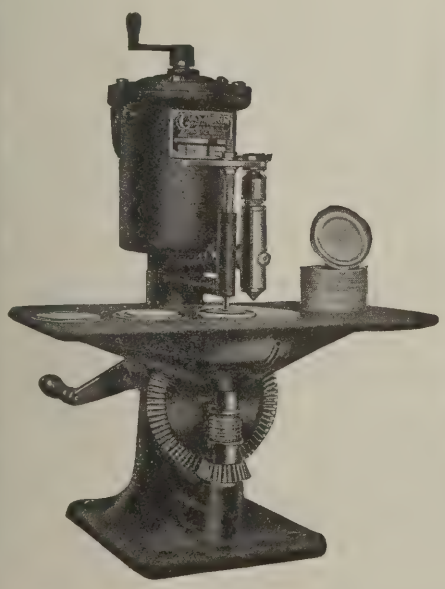
The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

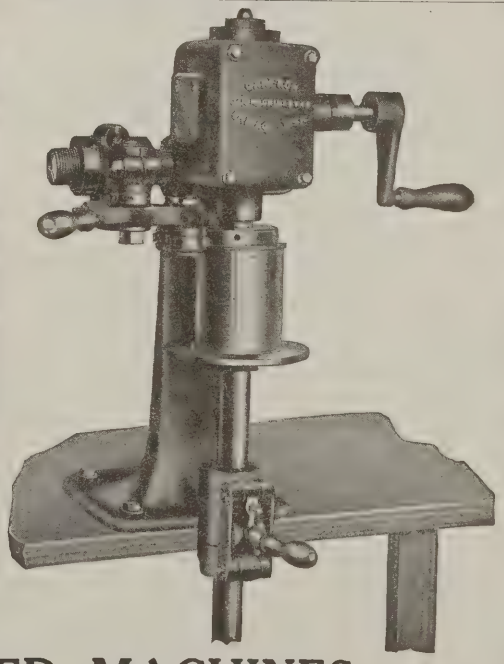
It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.



For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by



Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grader, and Other Canning Machinery.

CAMERON HAND OPERATED MACHINES

This double-seamer attaches bottoms to can bodies and covers to filled cans. The Compound Applier spreads the rubber cement on the edges of the can ends. These machines are suitable for cans from 2" to 6" in diameter and up to 9" high.

CAMERON CAN MACHINERY CO. **240 N. Ashland St., Chicago, U. S. A.**

23

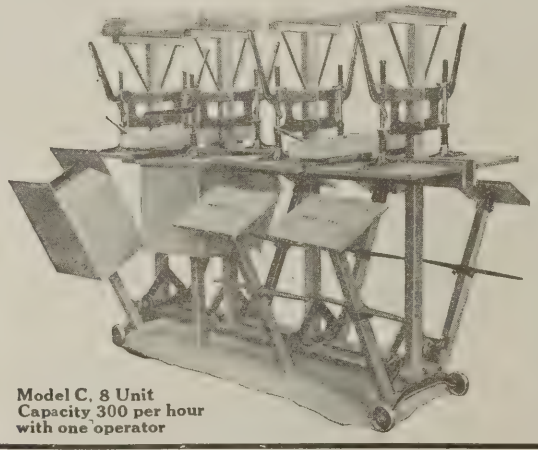
they want any fruits of quality, outside of these two items, they must secure their requirements north of the great sunshine state.

We are a little late in getting out our prices. Other canners have had their quotations before the trade for some time. Neither have we had time to arrange for brokers in various jobbing centers. We are proceeding at once to make our selling connections in all markets. We will need proper representation to maintain our contact with the trade.

W. H. PAULHAMUS, President.

FERTILIZING THE APPLE ORCHARD

A LOT depends upon whether the apple orchard is kept in sod or is cultivated as to what the most profitable fertilizer practice will be. While definite indications of direct beneficial results from fertilizers in cultivated orchards are lacking, there seems to be no question that, excepting possibly on the very richest soils, high ammonia fertilizers are essential to success in sod orchards.



Recommendations vary somewhat, but the following, from the Cornell (N. Y.) Experiment Station will serve as a reliable guide. During the first two or three years, a half pound of nitrate of soda or sulphate of ammonia may be scattered about each tree. The quantity may gradually be increased to three or four pounds when the trees are ten or twelve years old, and to five or six pounds when fifteen to twenty years old. When the trees are young the fertilizer should be spread under the drip of the branches, but when older, it may best be applied broadcast between the rows.

AUSTRALIAN CANNING SEASON NOW UNDER WAY

AUSTRALIA'S fruit-canning season, just under way, will consume some 24,500 tons of fresh fruit, according to information obtained by the Department of Commerce from the Canadian Government. It is estimated that the total pack will reach 2,100,000 dozen 30-ounce cans. The varieties of fruit and quantity of each to be packed are apricots (2,500 tons), clingstone peaches (10,500 tons), freestone peaches (2,500 tons), pears (3,500 tons), and pineapples (5,500 tons). Owing to the severe losses incurred by the Commonwealth Government in guaranteeing a price on the packs of previous seasons, a request for a guaranteed price for the present season was refused, but a subsidy on production and export, amounting to a total sum of £141,000, was offered to and accepted by those engaged in the industry. As the large surplus stocks held in London and Australia from previous packs have now been disposed of, the official board created to control sales will shortly cease to exist, and canners are to establish their own organization to provide for future sales.

NORWEGIAN SARDINES RUNNING GOOD NOW

WORRIES of the Norwegian sardine canners over a possible short pack have been dissipated and the canneries have been working full force since the first of the year, Consul G. N. Ifft, Bergen, informs the Department of Commerce under date of January 19. An abundance of fairly good raw material has been received not only from the Norwegian coasts, but from Danish, Belgian, Scottish and Welsh waters. The canneries, however, are somewhat dubious about the Belgian fish, as they are coarser than the Norwegian bristling, and there is considerable difference in taste and aroma. Notwithstanding the reported shortage of bristling off the Norwegian coasts last year, the canneries still exported approximately 21,250,000 kilograms of sardines and canned food products. This is a quarter of a million kilos less than in 1922, but still six millions more than in 1921. Two-thirds of the export last year was from Stavanger. Trondhjem was second and Bergen was a close third.

Do You Know

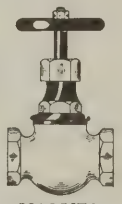
— that PROTEXU CANNERS APRONS will save you money because they are **low in price, unusually durable,** and afford **greater protection** for your employes?

Scientifically constructed of fine, strong fabric, amply coated with tough, elastic, **wear-proof rubber,** Protexu Aprons are especially designed for all canning operations. Hundreds of canners use them exclusively, finding them **most economical.**

Moreover, Protexu aprons are **soft, flexible, lightweight** and extremely **comfortable** to wear. Made in any standard or special size, with or without bib.

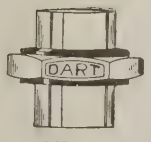
COLORS: Black or White
30" x 38 — $12.00 dozen
38" x 44" — $15.00 dozen

Send trial order TODAY — and learn how much apron service you can buy for your money. **Maximum protection at minimum expense guaranteed.** In ordering, please mention style and size desired. Samples of fabric, showing quality, on request.



BEAR BRAND APRONS, another popular style (grey), **large in size,** and weighing only **16 ounces,** costs **$15.50 dozen.**

William M. Gross.



Makers of all styles aprons for all industrial purposes

ESTABLISHED 1878

The Markets

BALTIMORE, APRIL 21, 1924

WEEKLY REVIEW

Buying Keeps Up in Fine Shape—Markets Show Very Few Price Changes—Peas May Be Short Pack in This Section—Futures All Selling Slowly—Some Reasons Given—More Canners Packing New Lines.

KEEPING UP—The buyers are continuing to come into the market for a steady supply of canned foods, actual market conditions showing no relative change from the past months. It is becoming hard to find the kinds of spot goods that are wanted, and in some articles next to impossible. The average canner you meet turns his palms upwards and says he is all cleaned out, and the others, the canners of the staples, have mostly been cleaned out for many months. In fact, one cannot but puzzle where the brokers or buyers are finding the spot goods they must have to keep the market supplied, when he takes into consideration the number of canners who say they are cleaned out or have been cleaned out for months. Daily canners come into the office, or are met upon the streets, and the almost invariable reply is that they have no goods on hand. Small wonder, then, that the buyers are reported as having trouble to find what they want.

About the only changes reported in the market quotations are in No. 10 tomatoes, which are marked down this week, again, from $4.65 and $4.75 to $4.50. Make your own guess why this should be the case, for we confess we do not understand it. But who can understand the ways of the festive tomato? One other item shows a few price changes and that is strawberries, whose packing season is nearing, and those who may have a few on hand usually want to clean them out before the new packing begins. This probably accounts for the reductions in strawberries. No. 2 extra preserved have been reduced 5c to $2.25; No. preserved also 5c to $1.25, and No. 10 in water are now quoted at from $5.00 to $6.00, where they have been quoted at $6.00. These make up the entire market variations as now shown.

THE CROPS—As intimated last week, some of the pea canners of this section have had considerable trouble getting their fields planted, and the season is long past its regular date for this. The season has been bad for the pea canners, and unless it changes for the better, and then provs a very fine growing season there my be trouble, and not only in this section, but in the most of the pea growing regions. All pea canners, of course, have not been so caught, some of them have been lucky enough to have gotten their peas planted, but in such cases they say they have not been able to get out the acreage they had last year. In this locality there is a reason for this. The pea aphis or pea louse has played havoc with many pea fields in this so-called southern district, and the growers are not very anxious to attempt peas again. Greenabum Bros., who for years was one of the largest pea canners in this section, decided to abandon peas entirely, because the section around Seaford, Del., was hit year after year by heavy losses due to this louse. This will give some idea of the severity of this visitation and how seriously the growers and canners consider it. As a result the growers are overwilling to make excuse of weather and what not to avoid growing peas for the canners. The unfavorable season thus far and its lateness may mean a shortened pea pack for this section even if the balance of the season were favorable. And this lateness brings all peas within the danger time of the louse. As a result the pea canners of other sections are on the uneasy seat and will be until they can see the crop well advanced, and the season favorable. So while all the industry is counting upon a record planting and packing of peas for 1924, it might be well to remember that "there is many a slip twixt cup and lip." The pea pack is only in intentions at present; most of it remains to be planted and all of it to be grown and harvested.

Pea canners in California have about given up the idea as impractical, because of this pea louse, and the pack there will be light this season.

FUTURES—The general report is that futures are moving slowly. There are two reasons for this: first, that the buyers have fairly well covered their requirements, and secondly that, the wave of caution which is sweeping over the country, carrying with it the intimation that we are about to slip from the false and inflated level of prosperity we have been on for some years, is being felt by the buyers and they have decided to slow down. This later condition might easily be discounted, because the jobbers now know that the country can consume an immense quantity of canned foods, they also know that their spot supplies are lower than ever before, and that they will need generous supplies of goods next fall, come what may, and that there is but slim chance of the prices being any better than now. But with their bankers continually preaching caution, to go slow and not to overbuy, it is but natural that they should slow down. The real cause, however, we believe, is that they are well covered, and that means that the canners must be well sold up and so we can regard this present slowing up without worry. And particularly until they can see a little better what the crops may do for them.

Future tomatoes continue to be quoted too low. County brokers are quoting them: 1s, 55c to 57½c; 2s, 85c to 90c; 3s, $1.25 to $1.30, and 10s, at $4.00. Unnecessary to state these cover Tri-State canners, as the canners of Indiana and elsewhere have sold out their respective packs at very much higher prices. It is not likely that California will go very heavily into tomato canning this season, unless the season proves unfavorable for crops in the balance of the country, then California can jump in.

CANNING EXPANDING—We have already called attention to the probable increase in the number of canners handling stringless beans during 1924, as a considerable number of canners will take on this item this year for the first time. And now it would seem that California is to have more rivals in the canning of asparagus. Michigan, New York State, North Caro-

lina and some others are going into the asparagus canning game on a larger scale, and it would seem the acreage of this item has been increasing to warrant such attempts. Maine but recently got into the habit of packing stringless beans, and likes it and is increasing her output. And now Maine has taken to canning peas, and so the industry branches out, spreading to every section and taking in every item of food. This is all for the good of the industry, there being but one thing necessary and that is that these new goods be quality packs.

NEW YORK MARKET

Market Getting Stronger—Tomatoes Offering at Low Prices—Indiana Tomatoes Strong—Booking Western Future Corn Pineapple Shows Renewed Interest — Buyers Continue to Want Peas—Southern Future Peas Still Offered—Succotash Wanted.

New York, April 17, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

MARKET Strengthening—The market is slowly, but surely, working toward higher ground as the shortage of the many wanted grades and varieties on spot becomes more acute. Distributors are now practically down to bare floors on some items, and can see no prospect of getting replacements until the new pack is available.

Peaches Higher on Coast—California fruit canners, who withdrew from the market a few weeks ago, when the new crop of canning peaches was reported heavily damaged by the weather, have re-entered the market, with higher prices all around. The California Packing Corporation quotes standards at $1.85 in the current list. Other grades of fruits have also been advanced by the Corporation and other holders. Chief strength appears to center on standard quality, which is not in heavy supply either in first hands or in resale channels.

Retailers Buying—Wholesale grocers report that they are getting a very good inquiry for the entire line from the retail grocery trade. Retail grocers, like their jobbers, have permitted their stocks of some staples to run very low, and when they re-enter the market they find out that not only have prices advanced materially since they made their last purchases, but that in many instances the goods are unobtainable.

Strengthens Future Outlook—This situation has strengthened the future outlook, and the retail trade is sending in its future orders to the wholesale grocers in larger volume.

Southern Tomatoes—Future tomatoes for shipment from country canneries continue to offer at 55c for 1s, 85c for 2s, $1.25 for 3s, and $3.90 to $4.00 for 10s, f. o. b. cannery, 100 per cent contracts. The demand is reported to be fair. Spots are quoted at 62½c for 1s, 95c to $1.00 for 2s, $1.37½ to $1.40 for 3s, and $4.50 to $4.75 for 10s, all f. o. b. country canneries, with the usual differential obtaining on tomatoes for shipment from Baltimore city canneries.

Indiana Tomatoes—Continued strength on future Indiana tomatoes is reported, with the market quoted $1.35 to $1.40 for 2s, and $4.50 for 10s, 2s being generally withdrawn. For 1923 pack Indiana tomatoes, the small lots remaining unsold are held at $1.10 for standard 2s, $1.65 for 3s, and $5.50 for 10s, all f. o. b. canneries.

California Tomatoes—There has been no change in the tomato situation on the Coast. Packers are not yet generally offering futures, and the carryover of 1923 pack is well sold up.

Southern Standard Corn—Spots are offering at 92½ to 95c per dozen for standards 2s, and 62½ cents for standards 1s, f. o. b. country cannery. The market for future standard is quoted at 65c for 1s, 92½c for 2s, 95c for extra standard 2s, and $1.00 for fancy 2s. The demand has been quiet during the week.

Western Standard Corn—Midwestern canners are booking future standard corn at an inside price of 95c, it is reported, with many packers asking $1.00 to $1.05. The movement of spot corn continues good, and the market is well cleaned up. The carryover of spot Western corn this season will be negligible.

Salmon Routine—There has been little of general interest in the spot salmon market during the week. There is some talk of low-priced reds around the market, but it appears that the salmon referred to involves only a small lot of one brand, offered at 5 to 10 cents under prevailing spot quotations. Pinks are quiet and unchanged. Chums are in limited supply, and strongly held. The same is true of fancy chinooks.

Tuna Strong—There has been some inquiry for tuna for coast shipment during the past few weeks, and stocks remaining unsold in first hands are reported to be extremely light. Distributors' holdings are also closely sold up, and replacements will be needed by many of them to take care of their summer demand for the "chicken of the sea."

Sardines—The Maine sardine fishing season is officially open now, having opened on the 15th, but this means little to the packers, who do not expect the run to amount to enough to justify canning for a few weeks. The packers go into the new season with the market practically bare of carryover. The pack of 1923 has been almost entirely exhausted from first hands, the market having been featured by a steady advance during the past several months.

Lobster Selling—There is some demand for new pack lobster, which is offered f. o. b. cannery at $8.00 for 1s, $4.25 for halves, $2.30 for quarters.

Pineapple — There has been some revival of interest in Hawaiian pineapple, and the market has strengthened a little. As a result of this change in the situation, jobbers are showing more willingness to discuss futures, although it is reported that the volume of future business placed so far has been rather light. The packers will feature both crushed and sliced this season in their nation-wide publicity.

Pie Fruits—Stocks of No. 10 pie fruits in this market are not large, and it is reported that canners' holdings on the Coast are also small. The shortage in No. 10 fruits applies to both the pie and water grades. Resale trading is now furnishing the bulk of interest in No. 10 fruits, although some little interest is being manifested in the future outlook.

Peas—Demand for Wisconsin peas on future contracts has continued active. Buyers want both fancies and standards; in fact, buyers seem willing to book most any assortment of peas they can get from the new pack. While most of the canners are withdrawn from the market, the late sellers are booking some business, and are justifying their lateness by getting prices higher than those received by the "early birds" among their competitors who started selling last December. As far as 1923 pack Wisconsin peas in first hands are concerned, this item is more in its proper place in the history of the industry than in a market report.

Southern Peas—Maryland, Delaware and Virginia canners are still in the market with future peas, quoting standard 3s at $1.17½ to $1.20. Extra quality 4 sieve are held at $1.20 to $1.25, with 1 sieve quoted at $1.70 per dozen. The inside price on spot Southern peas for factory shipment is $1.45 for 4 sieve standards. Extra quality No. 1 sieve for prompt shipment are quoted at $2.50. Canners report that they are getting a quiet business at these prices. Owing to the high price basis now prevailing, jobbers are not taking any chances of overbuying, but are stocking only for immediate needs.

Succotash Wanted—There has been a good inquiry for fancy succotash in this market during the past week or so, and buying has exhausted available supplies. Prices are nominal in the absence of any important offerings.

New Southern Spinach—The damage to the California spinach crop, with resultant advanced prices, has stimulated interest in Southern pack and buying is on the increase.

CHICAGO MARKET

Spots Active, Futures Quiet—The Opening Prices on Asparagus Causes Interest—Hard to Find Spot Goods of Any Kind —Florida Canned Tomatoes Come on the Market —Corn Wanted for Prompt Shipment— Michigan Canned Fruits on Same Basis as Last Year — Canned Salmon.

Chicago, Ill., April 18, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

MARKET Active—The market for canned foods continues to be active throughout the central west for all varieties spot goods for prompt delivery, but the market for futures of the 1924 pack is somewhat inactive. The wholesalers appear to have supplied themselves, for the time being, with future contracts sufficient to cover the requirements of sales of futures to the retailers, and are now apparently waiting for their sales to catch up with their purchases.

Canned Asparagus—The opening of prices for California canned asparagus this week by F. E. Booth & Co., San Francisco,

Cal., has excited some interest, but has also excited some disapproval, as the wholesalers think that the prices are entirely too high and are not inclined to contract at the prices. It is possible that canners may be able to make lower prices when the market for asparagus is generally opened by all the canners.

The difficulty of obtaining supplies of spot canned foods still continues and brokers state that they are unable to close more than about half the orders and inquiries they receive from the wholesalers, being unable to find goods of satisfactory quality at satisfactory prices in first hands.

Florida Tomatoes — The matter of chief interest for the week in canned foods matters was the entrance of Florida canners into the canned tomato market. Samples were received of standard No. 2 tomatoes from Florida, and proved to be of excellent quality, good fill, flavor and color, and the first canner who offered several thousand cases ready for shipment was sold out in one day. In understand the price figured about $1.07½ delivered on track Chicago.

Heretofore, canned tomatoes from Florida have been for the early pack rather unacceptable on account of the prevalence of green pieces of tomatoes in the cans, being picked before they were thoroughly ripened, but the samples shown this week, though not as thoroughly ripened as the later pack will be, or as the regular western and eastern pack, nevertheless were very good average color.

The offering of these Florida tomatoes will, of course, distract attention from eastern offerings to some extent as they are at a slightly lower cost laid down, and as there are no canned tomatoes in the west whatever, it is quite likely that Florida offerings will soon be sold out.

The stocks of canned tomatoes in the hands of wholesalers in the central west are almost down to the floor on both 2s and 3s, but the stock of No. 10s is adequate and there is but little demand for that size.

Canned Corn—The demand for canned corn for prompt shipment continues unabated and not only is the central west buying regularly of desirable lots, but the southwest and extreme west have appeared in the market and are taking desirable offerings freely. The purchases of canned corn, however, are largely confined to goods for immediate or prompt shipment, and although there is a fair sale for futures, wholesalers are disposed to be leisurely in placing contracts for future packed canned corn. The sales of futures in Iowa, Illinois and Indiana have, however, been large, very considerably larger than this period last year, and this probably accounts for the slowing up of future sales just at the present time.

Canned Peas—A large part of the pea canners of Wisconsin have withdrawn from the market and are not offering 1924 or future pack. They have contracted a large business and many of them have sold up to the line of safety.

In spot goods there is nothng of interest to report as the small remaining irregular lots throughout Wisconsin in first hands are so unimportant that transactions are few and insignificant. Chicago wholesalers have been trying to buy canned peas from New York State canners, but generally find prices so high that they are discouraged and do not order freely.

Canned Fruits — Michigan canners generally have named prices for 1924 output of canned fruits and prices are about on a parity with those of 1923. For instance, red sour pitted cherries in No. 10 cans are priced at $9.00 f. o. b. Michigan, 1924 pack, canneries, which was about the opening price of 1923. Allowing a slight advance for the higher price of cans this season Michigan canners are pricing their goods on the same basis as 1923.

Placing of future orders for Michigan fruits so far has not begun actively, but is expected to begin in a few days. Spring weather has arrived and the prospects for business are more encouraging, and the hindrance to the distribution of canned foods, and the shipment of them, no longer exists and stocks of all kinds will go rapidly into consumption. This will have an effect on future or 1924 business and more contracting for futures can be anticipated.

Hawaiian Pineapple—The sale of Hawaiian pineapple for future 1924 delivery has not been near so large or important as heretofore, from the fact that orders were delivered of the 1923 pack 100 per cent. and the supply in the hands of wholesalers was larger than usual on that account.

Then the pineapple canners protected their customers and the market by refraining from selling to speculators, thereby leaving the stock in the hands of the legitimate jobbers and preventing artificial inflation of prices.

There was some canned pineapple sold to speculators indirectly, or through indirect negotiations, which the canners could not help, but this had a discouraging effect rather than a stimulating effect on the price, for the wholesalers having received 100 per cent. delivery, were well supplied and would not buy canned pineapple of the speculators, not only because they did not need it, but because they wanted to discourage the scalpers and speculators.

Therefore, the offerings of Hawaiian pineapple by the speculative interests were urged upon the market and had an opposite effect from that which speculation usually has. The market has now recovered, however, and no offerings are heard of below opening price and most offerings are higher than opening prices.

In crushed pineapple there has been an important advance as the quantity was too small to meet the demand for manufacturing purposes. The information that pineapple canners were going to refuse to sell pineapple cores to those who have heretofore been crushing them and selling them to bakers and preservers, has been received in this market by the wholesalers with approval.

Not only does this approval arise from the general desire to keep the quality of all canned foods up to the highest standard, but the action of the canners is approved because the canning of the pineapples cores and placing them on the market as crushed pineapple was not only a deception, but was demoralizing to the regular grades and qualities.

Canned Salmon—Little is to be said in relation to canned salmon. Wholesalers are all complaining about the demand for Alaska red, Alaska medium red, and even fancy Chinook has sold as readily as usual. Prices have been high and have been well maintained, but the prices have not been proportionately higher than on other canned foods.

Several reasons have been given for the slow demand for salmon in this and the central western markets, and one is that prices are still higher proportionately than the price of fresh meats. Fresh pork is selling at very low prices through the west, and where housewives find they can buy pork chops for 18c and 20c per pound they will not pay 30c or even 25c per pound for canned salmon.

Another reason is one that I have frequently suggested, and just as frequently been berated for, and that is that salmon canners have put a great deal of effort into introducing common hump-back pinks and chum salmon, substituting them for the better grades and that this has to an important extent broken down the demand for fine canned salmon.

ST. LOUIS MARKET

All Food Lines Quiet—Advances Looked For—Buyers Waiting Too Long—Think There Are Enough Tomatoes—Futures Are Weakening—Substituting Lower for Higher Grades of Peas — Fancy Corn Hard to Find—California Spot Fruits Are Nearly All Gone—Small Peach Crop.

St. Louis, April 17, 1924.

By "Missourian."
Special Correspondent "The Canning Trade."

ALL Food Lines Quiet—The canned foods market is quiet, not unlike other lines of food. There is every indication that there will be an advance in prices for foods most in demand when holdings are diminished. This will strengthen feeling among packers on their 1924 output. According to the best informed, the present situation is a very unusual one. The reason for the present market situation is because of the small, but steady, trading. The hand-to-mouth buying policy of the distributors, extending over a long period, shows that the volume has been greater than when quantity buying was done.

While it is admitted by many distributors, the limited extent of unsold 1923 canned foods is a positive shortage in some items and anticipated scarcity later on in others, they are not taking advantage of this condition of the market to buy now when bargains can be obtained much better than can be obtained later on, when the goods cannot be had. According to many of those who know, the call for staples is not what it should be. In fact, it is not normal. Nearly all distributors continue on a hand-to-mouth basis, and are taking care of their present needs only. When they are short they are buying, but they buy only moderately sized lots only and turn them over before adding others.

Tomatoes—Tomatoes are like many other offerings which are not in the close clean-up class. Dealers believe that there will be enough of the 1923 lines to carry the trade through the rest of the year, so buying is continuing in a conservative way. Spot offerings are wanted, and to meet this demand, stocks are

being carried for immediate delivery. More small sizes are sold than gallons, which are neglected and dull. The firmest lines in Southern packs are unlabeled No. 2s. No. 3s are taken in a jobbing way. Futures have weakened slightly, as is the general rule after opening. Buying for a later delivery is limited It is a long time to packing time, and the jobber believes that too free a sale on contract might tend to too heavy an acreage and production.

Peas—Cheap peas are in big demand. Canners have sold out most of their packs, except some of the less wanted ones, and these are generally held above the ideas of buyers. Resale blocks are most in evidence. There is getting to be much substituting of extra standards for fancy, and there will be a close clean-up by the time the new pack is available. Futures are as firm as ever, and many canners are not willing to book any more business, fearing that they will not be able to deliver in full on what they have already under contract.

Corn—There is not very much being done in corn except of a routine nature. Fancy packs are very difficult to find, but occasionally can be picked up if the buyer hunts long enough. Some near standards are being offered, but a critical buyer does not care to take them. There is not an overabundance of spot standards, and prices on them are on full quotations.

Fruits—According to information received here regarding the fruit situation on the Pacific Coast, there is a very small working stock of fruits of all varieties left. Even with no more than the usual distribution of the needs at home and abroad, California will go into the new pack with the smallest carryover in many years. This situation is recognized more clearly by brokers than by distributors. One of the outstanding items is sling peaches, always a popular seller. There are very few real standards reported left in the hands of any packers in the State. The State has been thoroughly canvassed by some brokers, and they have little to show for their trouble. Seconds are even more scarce than standards. Choice are more plentiful than any other grades. When standards are not to be had at prices the dealers will pay, the trade is compelled to switch. Cheap lines are not available, but anything that is still attractively priced is readily taken at the advanced prices. Canners have firm ideas as to futures, but the season has not advanced far enough to enable them to be active in seeking business on contract.

Pineapple—Some strength is being shown in pineapple, and there is a rapid disappearance in cheap lines. There were only a few lots available a short time ago, and the tendency is to advance prices.

Fruit conditions are fair, except for peaches. Apples are 85 per cent of normal, or the same as last year. Peaches 40 per cent, the same as last year. Apricots are a failure. Most fruit buds were held back by the cold weather. Strawberries were hurt slightly by recent freezes in the Southwest, and can fruits killed down during the winter.

Prices—The following quotations are reported here f. o. b. at points of shipment:

Tomatoes—No. 2 standard, Indiana, $1.20; No. 3 standard, Indiana, $1.60.

Corn—No. 2 fancy, Crosby, Minnesota, $1.35; No. 2 fancy, Golden Bantam, $1.95; No. 2 stand., Evergreen, Wisconsin, $1.15; No. 2 fancy, Country Gentleman, Illinois, $1.10; No. 2 extra standard, Evergreen, Illinois, $1.00; No. 2 standard, Iowa, 95c.

Peas—Fancy No. 1, Alaska, Wisconsin, $2.60; fancy No. 2, Alaska, Wisconsin, $2.20; fancy No. 3, Alaska, Wisconsin, $1.70. Extra standard, No. 2, Alaska, Wisconsin, $1.00; extra standard, No. 3, Alaska, Wisconsin, $1.45; extra standard, No. 4, Alaska, Wisconsin, $1.35. Fancy No. 2, sweet, Wisconsin, $2.25; fancy No. 3, sweet, Wisconsin, $1.90; fancy No. 4, sweet, Wisconsin, $1.60. Extra standard No. 1, sieve, sweet, Wisconsin, $2.00; extra standard No. 2, sweet, $1.65; extra standard No. 3, sweet, $1.45; extra standard No. 4, sweet, $1.35.

FERTILIZERS HELP PEACHES

THE application of fertilizers high in ammonia, (nitrogen) to peaches has proven so profitable in Missouri, that the practice has become quite general in that State. Winter injury is one of the serious detriments to peach growing, and fertilizers have shown a distinct tendency to increase the hardiness of the trees. The importance of this may be gathered from the fact that in some parts of the State winter injury is so severe that a crop is not looked for more than once in three or four years.

CALIFORNIA MARKET

The Market Growing Firmer—Crops Cannot Be Large This Season — Buyers Covering — Further Advances Expected—Cherries Hurt by Frosts—Tomato Acreage May Be Increased—Fresh Cherries Are Being Shipped East—Asparagus Canning Is in Full Swing—Coast Notes.

San Francisco, April 17, 1924.

Special Correspondent "The Canning Trade."
By "Berkeley,"

THE Market Firmer—Practically everything in the line of California canned products is showing a firmer tone, but the higher prices being quoted on fruits, and some lines of spot vegetables, do not seem to be interfering in the least with the business being done. Crops cannot be large this year, owing to the setbacks by drought and frost, and there is a general tendency on the part of buyers to anticipate their requirements a little farther in advance than they have been. The recent increase of prices by the California Packing Corporation on spot stocks of fruits has been followed by similar action on the part of others, having stocks on hand, and further increases in some lines are expected in the near future. The lower grades were not packed heavily last year, and these are now in light supply and commanding relatively more attention than the higher grades. Standards and seconds in most fruits are especially scarce. The recent frosts have done some damage to the cherry crop, and the canned pack is more sought for than it was a few weeks ago. Growers of peaches, pears and apricots are expecting higher prices than those received last year, but it is not expected that these will reach the level of those of 1922, despite the outlook for a short crop.

Tomatoes—The prospect of a larger acreage devoted to tomatoes than seemed likely early in the season, coupled with the benefits from the recent rains, has had its effect on prices, and spot No. 2½ standards are again to be had for $1.15, and even a little less. Futures of this grade are being quoted by some firms at $1.10 without any rush of business being noted.

Cherries—Cherries are going forward from California to the Eastern fresh fruit markets in small quantities, suggesting that it will be but a short time until canners will be engaged in handling this fruit. The damage by frost has been confined to a few districts, and the crop promises to be a fair one.

Asparagus—The packing of asparagus is in full swing in the delta district, and the output is keeping well up to schedule. The rains experienced late in March were of great benefit, and an occasional shower would insure a large pack. Owing to the prevalence of the hoof and mouth disease among cattle, embargoes against the shipment of fresh vegetables from California have been made by some communities, with the result that more than the usual proportion of the asparagus crop is being handled by canners. Incidentally, the epidemic mentioned is affecting business quite seriously in this State. Travel is being restricted in many places, transportation of supplies is being held up, and a free interchange of commodities is being interferred with.

Salmon—Several of the salmon packers of the fleet of the Alaska Packers' Association have left San Francisco for Alaskan waters, despite the fact that the customary agreement with the Alaska Fishermen's Union has not been signed. Negotiations have been under way for weeks between packers and fishermen over differences in regard to working conditions, but no settlement has been arrived at. A. K. Tichenor, of the Alaska Packers' Association, states that there are no differences about wages, working conditions alone being involved. Owing to restrictions on fishing and a rather quiet demand for Alaska red salmon the full San Francisco fleet will probably not sail this year.

Coast Notes—Bryce Florence, formerly secretary of the California State Fish Exchange, and now with the Henry Dowden Co., has compiled figures of the 1923 catch of fish in California, placing this at slightly more than 223,000,000 pounds. Sardines ranked first in tonnage, the catch of this fish amounting to 158,159,356 pounds, with Albacore second, with 12,488,199 pounds. The catch of salmon was but little more than 7,000,000 pounds. Approximately three-fourths of the fish caught in California waters are canned or cured, the former process taking the largest quantities. Engaged in the business are thirty-two fish canneries. The total investment in boats and gear is esti-

mated at $10,000,000, while the value of the canning plants is placed at about $6,000,000. Fishermen received from $y0 to $12 a ton for sardines last year, while Albacore brought as much as $300 a ton.

The demand for the cheaper grades of canned salmon is well maintained, with pinks receiving special attention. Alaska reds and chinooks are being bought as needed.

H. A. White, manager for the California Packing Corporation at Honolulu, T. H., returned recently from an extended stay in the Philippine Islands, where he surveyed the prospects for developing the pineapple industry. He found many drawbacks to the growing of pineapple there, including laws which prohibited the farming of large tracts by any one company. With a revision of existing laws he suggested that the industry could possibly be developed into one of importance.

The Honolulu Plantation Co. has completed arrangements whereby practically all of the output of its sugar refinery at Aiea, the only one on the Hawaiian Islands, will be used by canners of pineapple. In the past most of the output of this plant has been shipped to the mainland, and the sugar used by pineapple packers brought from outside sources.

Libby, McNeill & Libby have secured the output of the Kirkham orchards at Brentwood, Cal., for a long term of years, and the erection of a cannery at Tracy is being considered.

The O'Malley-Collins Co., Inc., 112 Market street, San Francisco, Cal., has announced its intention of retiring from the brokerage field on May 1.

Mr. and Mrs. F. A. Wilcox, residents of Santa Clara county, Cal., were instantly killed near San Francisco on the evening of April 9, when the automobile in which they were riding was struck by a train. Mr. Wilcox was a director of the California Pear Growers' Association and was returning home from a meeting held in San Francisco when he was killed. Besides being a director of the pear growers' organization, he was a director of the California Co-operative Canners, San Jose, Cal.

Recommendations that the action of the Oakland (Cal.) Chamber of Commerce against the Southern Pacific Co. and other railroads to obtain lower freight rates to interior points than those named for San Francisco be dismissed have been made by Examiner J. O. Cassidy in his findings to the Interstate Commerce Committee. Examiner Cassidy holds that San Francisco, Oakland and other east-bay cities are a single community, except in name.

SEATTLE MARKET

Salmon Market Spotty—Distributors' Stocks Light—Market Is Well Controlled — Fewer Reds Offering — Few Packers Willing to Take Futures—Outlook Uncertain— Heavy Booking of 1924 Pack of Fruits.

Seattle, April 17, 1924.

By "Nomlas"
Special Correspondent "The Canning Trade"

MARKET Spotty—Trade in salmon has been rather spotty during the past week, and the situation has shown no material change. There has been, however, a slight increase in the number of inquiries received, and the trade here feels that the spring campaign is about at hand.

Distributors' Stocks Light—Reports received here indicate that stocks of salmon held by distributors, both wholesale and retail, are rather light for this season of the year. The trade has been buying in hand-to-mouth fashion for some time past now, and this is reflected by depleted holdings. Canners believe that when buying does commence, it will come on with a rush.

Market Well Controlled—Practically all of the smaller operators are cleaned up on pinks and chums, and the so-called "outside" holdings of reds are not active. With the market in strong hands, therefore, a continuation of the present firm price basis would appear to be indicated.

Reds—Offerings of red talls at $2.25 per dozen are becoming fewer. The larger holders remain firm at $2.35, and some of the sellers who were taking $2.25 business early in the month have advanced their views 5 cents per dozen. Red halves are held at $1.50. Export trading on reds has remained rather quiet.

Pinks—This division of the market has been rather uneventful. Some export buying has been reported, but the domestic trade has been slow. The stocks are not heavy, however, and there is no disposition just now to force the issue by cutting prices. Chums are in very limited supply, the market being nominally held at $1.20.

Futures—Few of the packers are willing to take a chance on naming future prices just yet, and this class of packer is booking s. a. p. There have been prices made in a few instances, however, on the basis of present inside spot prices. Fancy chinooks on future contracts are quoted at $3.75 for 1s and $2.25 for halves.

Outlook Uncertain—The outlook for the coming season is uncertain. In addition to the higher packing costs, due to advances in prices for cans, boxes, labels, labor, etc., the salmon canners are faced this year with the prospect of further drastic curtailment of fishing privileges by the Government. Under these circumstances canners are proceeding very slowly and are sounding out the situation thoroughly as they go along.

New Pack Fruits—There has been a heavy booking of 1924 pack of Northwestern fruits, following the announcement of opening prices a few weeks ago. Berry bookings have been heavy, buyers asking for early shipment on the various grades which are now in such short supply in the spot markets of the country.

What The Brokers Say.

Baltimore, Md., April 19, 1924.

The spring trade for the general line of canned foods is developing slowly, it is true, but it is developing, and that fact is an encouraging feature in the market situation and outlook. Outside of crushed corn and tomatoes the buying orders find much lighter stocks than usual for this time of the year from which to draw supplies. We do not mean to indicate there are more than enough tomatoes and crushed corn to last until the new canning season for each rolls around, but merely cited these staples in relative comparison with the light stocks of other items. For instance, shoepeg corn, peas, stringless beans, spinach, potatoes, beets and cove oysters are so nearly sold out that in some cases it is necessary to fall back on buyers' stocks here and elsewhere to meet the demands of the trade at this time. As a result, each month since the first of the year has shown some advance in one or two articles whenever the demand has increased, and whatever declines there have been were in those items which are the least important.

Those canners and other holders of tomatoes who have long purses and substantial bank accounts are holding their stocks firmly at today's quotations. There are a few, however, who for some reason or other must do business every day; hence the bargains which are popping up now and then, mostly then. The orders did not increase this week, but they were from widely separated parts of the country, which strongly suggests this section is the cheapest and, possibly, the only substantial source of supply. The outlook is for an active market during May and June. Keep your weather-eye on tomatoes if needed now or later on.

Future tomatoes were a trifle more active this week, but that touch-and-go spirit was not in evidence which is essential to big business in any item of trade. The canners are in a more receptive mood for volume orders, and are more liberal in their analysis of basic conditions and the outlook than heretofore. The market seems to be shaping up in the buyers' favor, and if so, a broader range of buying may be expected shortly.

THOS. J. MEEHAN & CO.

Aberdeen, Md., April 16, 1924.

Tomatoes—With the advent of seasonable weather, we are having a little better demand for spot tomatoes. Unlabeled stock is bringing a premium. Offerings of future tomatoes are more liberal since the packers have completed their arrangements for the coming season. We are booking orders for future tomatoes according to brands at the following prices: 1s, 55c-57½c; 2s, 85c-90c; 3s, $1.25-$1.30; 10s, $4.00, all f. o. b. factory.

Corn—Corn is moving out in fair-sized lots, although the demand is not up to normal for this season of the year. We are booking orders for future corn at $1.15 for standard shoepeg, $1.25 for extra standard shoepeg, $1.35 for fancy shoepeg, and 90c for standard crushed sugar corn, all f. o. b. respective shipping points.

Sweet Potatoes—We have left about 200 cases No. 3 standard sweet potatoes in lacquered cans at $1.30 per dozen, Baltimore. We also have about 600 cases No. 3 extra standard sweet potatoes in first-class condition at $1.75, factory. We quote new pack sweet potatoes for shipment when packed at $1.20 for 2½s, $1.25 for 3s, and $4.00 for 10s, f. o. b. county.

C. W. BAKER & SONS.

What Canned Foods Distributors are Doing

Swift and Armour Attorneys File Briefs Asking Voiding of Famous Consent Decree—May Indicate Return of Meat Packers to Wholesale Grocery Field—California Jobbers and California and National Wholesole Grocers' Association Charged With Conspiracy in Violation of Sherman Anti—Trust Act.

Will the "Big Five" Return?—What may or may not presage a determined attempt upon the part of the so-called "Big Five" meat packers to re-enter the wholesale grocery field is now occupying the attention of the entire grocery distributing trade.

Attorneys representing the Swift & Armour interests on the 15th filed in the District of Columbia Court of Appeals a brief declaring the entire "Consent Degree" invalid, contending that the Government itself has voided any legality which the "Decree" may have had.

In some quarters this is taken as an indication that the packers may again branch out into the handling of the "unrelated" lines, which would mean that one of the big buying groups lost to the canning trade in 1920 would be restored. Wholesale grocers believe that if the packers were to return as canned foods buyers they would in time gobble up many of the smaller canners, but canners have their own ideas on this subject.

In their brief just filed, Swift & Armour state that the Department of Justice in a statement the week previous declared that the Consent Decree carried the "implication" that the packers had been conducting business in violation of the anti-trust laws during the period leading up to the entering of the famous "Consent Decree" in 1920.

The "Decree" itself, state Swift & Armour, set forth that its terms "shall not constitute or be considered as an adjudication that the defendants, or any of them, have, in fact, violated any law of the United States."

The present case arose over the attempt of Swift & Morris to intervent in the California Co-operative Canneries case, in which the latter company endeavored to be made a party to the "Consent Decree" proceedings.

Swift & Armour contend that the decree is void for the following reasons:

First—Because the Supreme Court of the District of Columbia was without jurisdiction to enter the "decree."

Second—The decree violates the common law and the anti-trust laws themselves, and neither the consent of the Attorney General nor of the defendants could validate it.

Third—The Attorney General was without power or authority to consent to the "Decree" on behalf of the United States.

L. F. Swift, president of Swift & Co., issued the following statement in Washington following the filing of the latest briefs. "When the packers consented to this decree," he said, "they made it a condition that issuance would not in any way be understood as an indication that they had violated the law in any way. The packers even insisted that this be written into the decree itself.

"Swift & Co. has unexpectedly been thrown into the question involving the consent decree. The packers have made no attempt to have the decree altered or abrogated, but for some time the court has had under consideration a request from the California Co-operative Canneries to be allowed to intervene in order to get the decree changed. The Government has opposed this intervention and has recently filed a brief in which it says that the entry of the decree implied that the packing companies had violated the anti-trust laws.

It is this contention which has forced us into the controversy. In other words, the Government has now taken a position exactly contrary to the implicit understanding under which the decree was issued."

Wholesale grocers through their Association, it is reported, are preparing to oppose any modification or abrogation of the "Consent Decree" or any of its parts which the jobbers declare will vitally affect their business.

One of the chief causes of the wholesale grocers' complaint against the "Big Five" before the decree was entered was that the packers were shipping grocery commodities of all kind in cars with fresh meats, or in cars for fresh meats, and consequently were getting expedited service from the railroads which the wholesale grocers could not obtain in making their shipments to their retail customers.

More "Restraint of Trade."—One of the last official acts of Attorney General Daugherty, it has just been discovered, was to have a bill of complaint, in equity, drawn up against the California Wholesale Grocers' Association, most of the leading wholesale grocers in California, and the National Wholesale Grocers' Association.

This bill in equity has been filed in the District Court of the United States for the Southern District of California at Los Angeles, but it has not yet been served upon all of the numerous defendants named.

The complaint charges that during the past three years "at and within the city of Los Angeles" the wholesale grocers and associations involved have been engaged in a conspiracy to restrain trade among the several States of the United States and with foreign nations "in manufacturing, producing, buying, selling, contracting for the purchase and sale of, shipping and transporting" groceries in violation of the Sherman Law, Act of Congress, July 2, 1890.

Several types of alleged trade restraint are claimed in the bill, but one of the chief charges appears to be that the defendant wholesale grocers and associations have prevented or attempted to prevent chain stores and others from purchasing direct from manufacturers.

Pending further developments in the situation, no comment is forthcoming from the jobbers and associations involved.

The National Wholesale Grocers' Association, in announcing to members the filing of the suit, said: "The National Wholesale Grocers' Association will refrain strictly from trying its case or any features thereof in circulars or in the press. The matter will take its proper course in the courts. We owe it to our California members particularly and to wholesale grocers everywhere to state now most positively and sincerely that your Association, in keeping with the declaration of its Constitution, has endeavored at all times to observe scrupulously the letter and spirit of the law, to promote free and fair competition, and avoid every possible restraint of trade."

NEW FERTILIZERS CUT FREIGHT BILLS IN TWO

By the Soil Improvement Committee of the National Fertilizer Association.

HIGH freight and labor charges have caused the State Agricultural Experiment Stations to develop fertilizers which contain no useless substances. These high-analysis fertilizers, as they are called, reduce freight bills from one-fifth to one-half. When all the other handling, hauling and spreading operations are considered, the saving to the profit side of the farmers ledger is not to be scoffed at.

A. W. Blair, professor of Agricultural Chemistry at the New Jersey State College of Agriculture, gives some figures to show what a large saving in freight results from buying the high-analysis fertilizers.

"Sixteen hundred pounds of a 5-10-5 will furnish just as much plant food as 2,000 pounds of a 4-8-4; one-fifth less freight and handling charges.

"Four hundred pounds of a 3-12-3 will furnish as much plant food as 600 pounds of a 2-8-2; one-third off for handling.

"One thousand pounds of a 6-12-3 will furnish as much plant food as 2,000 pounds of a 3-6-1½; a reduction of one-half in freight and handling charges.

"There is a reason for the high-anlysis fertilizer; hence, the high-analysis fertilizer has come to stay."

QUALITY

The consistent use of

Wyandotte Sanitary Cleaner and Cleanser

by an increasing number of canners is proof that canners are quick to recognize quality, efficiency, economy and service.

This cleaner because it is peculiarly adapted to the needs of the canning trade, not only cleans clean, but it also sweetens and purifies everything it cleans.

Its use guarantees also containers faultlessly clean and so freely and easily does it rinse that preventable causes of "flats" are entirely removed. It will maintain your equipment in a fresh, wholesome, sanitary condition and will do this at the lowest cost.

Wyandotte Sanitary Cleaner and Cleanser has a use in every department of the cannery.

Indian in circle

in every package

It cleans cleans.

SMILE AWHILE

AGAINST NATURE

Uncle Dick had finally persuaded little Donald to run an errand for him, much against Donald's better judgment. For it was dark, the errand took him near a cemetery, and Donald had an honest fear of ghosts. But when Uncle Dick explained how easily ghosts themselves were frightened, Donald took courage and started forth.

He was back, breathless and errandless, inside a few minutes.

"I saw a ghost!" he yelled.

"But," asked Uncle Dick, "why didn't you whistle, and scare it away?"

"I tried to, but I couldn't whistle. My mouth was open too wide."

STRONG EVIDENCE

Hairlock Combs—Too bad Kathrine didn't write you today.

Whatson—Who said Kathrine didn't write me?

Hairlock Combs—Nobody did, but I just handed you a piece of gum and you took off the wrapper, threw the gum in the basket, and now you're chewing the paper.—Tiger.

UNRELIABLE

Mistress—Late again this morning! Don't you use that alarm clock I gave you?

Maid—Yes, ma'am. But it goes off when I'm asleep.

A young married man of a nearby town, whose family was recently enlarged by twins, rushed to the telegraph office to break the glad news to his parents. In his haste to get the joyful tidings on the wire he wrote: "Twins today. More tomorrow." —Mugwump.

SETTLED

"I thought, Sam," said Jones, upon meeting his colored friend outside the courtroom, "that you were going to settle your dispute out of court."

"We did, suh," declared Sam. "Dis yere am jes' de suit fo' 'sault an' battery what happened durin' de settlement."

THERE'S A DIFFERENCE

Chorus Girl—She don't look good in nothing.

Theatrical Manager—You should not say that. Say, "She looks good in nothing."

Chorus Girl—Naw, that ain't what I mean.—Mercury.

HEAVENS!

"What a charming baby! And how it does resemble your husband!"

"Gracious, I hope not! We adopted it."

ENCOURAGING

Young Man—Can your sister—er—cook?

Little Brother—I think she's going to. I heard her tell mamma that if that fish came here again tonight, she was going to make it hot for him.

SECOND THOUGHTS

"And at her request you gave up drinking?"

"Yes, sir."

"And you quit cigarettes for the same reason?"

"I did."

"And you no longer swear because of her disapproval?"

"Exactly."

"And it was for her you gave up playing poker, too?"

"Then why didn't you marry her?"

"Well, after all that reforming I saw that I could do better." —Jack-o-Lantern.

EDITORIALS

BRICKBATS AND BOUQUETS—Our wholesale grocery friends, who must, at times, feel that the comic strip artists have them in view when they speak of 'somebody is always trying to take the joy out of life', are once more on the anxious bench. After a most graceful surrender (?) upon the matter of the Flat Allowance they have been sending up paeans of joy and praise and congratulations upon the harmony and good-fellowship which now prevails between the producers, the canners, and the distributors, the wholesale grocers. And just as this chorus was welling up to full throated volume along came a report from Washington that a law compelling the name of the producer upon every package of food had been demanded and would be enacted. Bang! goes the baton on the chorus. The scenes are quickly shifted, and the hallalujas are replaced by dirges, the laments taking the form of complaints that such a law can make nothing but troubles and be of no possible benefit to anyone! The solemn wails of suffering distributors are blended and united, and, under the skilful guidance of their leaders, another chorus, this time a lamentation, swells up in grand harmony, even the canners joining in. It is truely Billy Sundayesque in the way they can make men stop thinking and do as they are directed, as note action of the Canners League of California, which has wired the committee at Washington its opposition to this name on the label law. And in other sections of the country, and in the great and small canners Associations, note the soft-pedal put upon this action, in the interest of harmony and to preserve the good feeling now existing between the canners and the wholesale distributors. It is not hard, of course, to blind the canners to their own interests; they never cared a whoop for them, if they could keep a fellow canner out of an order. And these noted leaders, these Sousas and Creators of the wholesale grocery bands, know perfectly how to play upon the feeling of these gentle canners, and how to tune them into perfect harmony with their plans.

And so the wholesale grocers, having brought harmony out of the Flat Allowance plan and enlisted the two former warring factions into a grand chorus, once more nip a budding hope, take the candy from the kids, as it were, and make them sing in contentment and happiness the song they set, even as they have done in innumerable cases before, as for instance in the Consent Degree case which robbed the canners of the best customers they had, the Big Packers. Did the canners cry and lament over this heavy loss? Not in the least, as you will recall once again the Canners League of California, where the fight mainly centered, threw its weight with their good friends the wholesalers, and ordered "thumbs down" on their good customers, the big meat packers. At least, the wholesalers should appreciate the splendid bouquets their friends and obedient servants, the canners, hand them on every occasion.

And now we are told by Congressman Arthur Free of California, in his address before the Canned Goods Exchange banquet on Tuesday evening, that this Consent Degree is to return to plague the present unlawful possessors. The Hon. Mr. Free says that the Consent Degree is against all law and precedent, a Daugherty enactment that cannot be made hold, and that whereas the big meat packers who consented without opposition to the original enactment of this degree, are now determined to fight it, and have it removed, and to again come into the business of canned foods distribution. Our readers well recall the bitter debate upon this question; that we branded it as about the most un-American ruling in history, similar to saying that if you are a corn packer you cannot pack peas; but the one inexplicable thing about it all, to us, was that the big packers took no steps to counteract it. Its unfairness and injustice were palpable, but they did not move a hand to stay the action, and consented, as the degree is termed, without a protest. It was said they wanted to get out of the canned foods, and kindred lines, business, and this can be the only explanation of their in action. As now, if they want to get back into this line of business, there is but little doubt that they can do so and will do so. Hon. Mr. Free has explained this situation so well that we will not attempt further explanation, leaving our readers to his account, which will appear next week.

THE WESTERN MEETING—The big meeting in Chicago got under way on time, and showed the large attendance which was counted upon. Mayor Dever stirred the audience with his appeal for the waterway from Chicago to the Gulf, and brought home the realization, predicted at the time the Panama Canal was completed, that the great waterway would mean the linking of the far west Pacific coast not only with the Atlantic, but with the great Central West. It merely enhances the already keen competition of the East, and robs the Pacific coast of its protection. The railroads are fighting it in vain, because it i sinevitable, and progress will bring it about. Mayor Dever need not worry about Chicago. He can sit still and let nature take its course, and Chicago will come out on top as he desires.

The account of the big meetings will begin in our next week's issue.

MAX AMS MOVES CHICAGO OFFICE

ON May 1st the Chicago office of the Max Ams Machine Co. will be moved to larger and more convenient quarters in the Straus Building, 310 S. Michigan Boulevard.

There they will be better able to serve their large and rapidly growing list of clients. Mr. M. D. Hopkins, their western representative, extends to all his friends and customers a cordial invitation to visit the new office, and to call upon him whenever he can be of service.

H. & D. ISSUE AN INTERESTING BOOKLET.

THE Hinde & Dauch Paper Co., of Sandusky Ohio, whose corrugated boxes are so extensively used throughout the entire canning industry, have just issued a handsomely printed pamphlet entitled "Better Shipping Packages for Food Stuffs". In this they illustrate how all food products can be best shipping in the sealed paper carton or box, saving in condition of the goods, freight and pilfering. They have not been content to just make a good corrugated paper container and let it fit as best it will every sort of manufacturer and shipper. They took up the problems of the canned foods packers; studied them from every possible angle, looked for the weak points in any container used, theirs as well as others, corrected the weaknesses, if any, and have been providing the canners with a case that has been tested and proved safe and satisfactory, and which they are able to claim will lay the goods down ready for the retail counter in better condition and at less expense than by other style of container. It is a science with them, and they are making their containers in compliance with the highest demands of the best practice. That is what this little booklet, beautifully colored and showing views of the boxes in use in all manner of food factories, teaches, and all canners will find it interesting. It will be sent to anyone asking for it.

DETROIT COMMERCE CO. NOW IN CHICAGO ALSO

THE Detroit Commerce Co., brokers and manufacturers' agents, well known in and around their home town of Detroit, have felt the necessity of a branch office in Chicago, and accordingly recently opened one there, in charge of Mr. E. M. Franz, formerly of Libby, McNeill & Libby and of the Hegeler Commerce Co. They have also opened direct representation at Toledo, Ohio, Fort Wayne Ind., and Buffalo, N. Y.

Mr. C. E. Flanders, the guiding spirit of this organization at Detroit, is out to serve his clients largely and well.

METAL STATISTICS FOR 1924

THE annual edition of the year-book "Metal Statistics", 1924, has just come to hand and proves to be a most interesting and valuable compilation of all data covering the metal trades. It is generally referred to as the standard statistical reference work of the ferrous and non-ferrous metal industries, and this year a number of additions of interest have been made to widen the scope of the book and to increase its usefulness to producers and consumers and buyers and sellers of iron, steel, metals, and their inter-related products. The new issue contains 528 pages and sells at $1. per copy.

GRAPE FRUIT CANNERS MEET

A meeting of the Florida Grapefruit Canners Association was held in Tampa, Florida, on April 16th, where officers elected were as follows:

C. E. Street.....President
Paul Stanton .....Vice-President
B. C. Skinner.....Secretary
A. V. Anderson.....Treasurer

All but two plants in the State of Florida are now members of this Grapefruit Canners Association.

There will be no surplus of canned grapefruit packed by the canners who sold "futures".

It also appeared that all but two of the plants have closed down for the season, and that the few plants now operating would close as soon as orders on file had been completed, which would probably be three to four weeks, at which time in any case, the supply of grapefruit to can would be exhausted—that is to say, the fresh fruit that is suitable for canning.

As but 60,000 cases have been packed in Porto Rico during the past season, this small pack in Florida together with the fact that the canners are not packing except on order to relieve the market there by the packing season next January makes the market look strong.

There was some discussion of the possibilities of some of the plants canning grapefruit juice.

A few of the Florida plants have been putting up candied grapefruit peel to take the place of citron as a confection and as used largely by bakeries in various kinds of cakes, such as fruit cakes, etc.

The Canners Association will be of great benefit in standardizing the pack and greatly improving the quality of the pack.

"BOB HEINL TO WITHDRAW FORM N. C. A"

WORD comes that Robert D. Heinl, Head of the Publications Division of the National Canners Association, on or about May 1st, will follow a long time inclination and, with the entire good will of the canners, enter business for himself in Washington.

Mr. Heinl will take on Washington representation of commercial organization or individuals, and publicity along the line of what he did for the Chamber of Commerce of the United States, the National Canners Association, and other organizations, without giving his full time to any one association.

In addition to this, he will inaugurate a Washington syndicated newspaper letter, and write special magazine articles.

The Relation of Contamination to Sterilization

By J. Russell Esty

Bacteriologist, Resarch Laboratory, National Canners Association

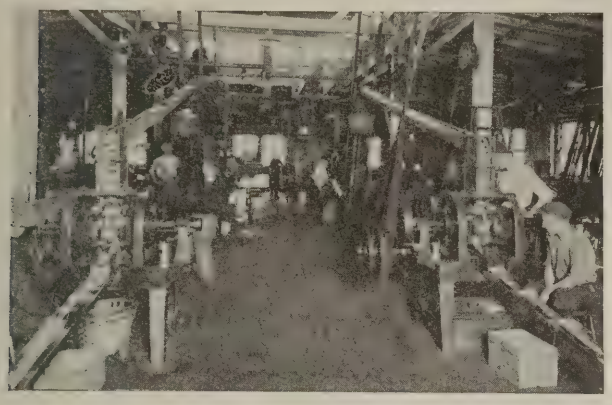
[NOTE—Dr. Esty spoke upon this subject before the Pea sect[illegible] t the Buffalo Convention, and his address was printed in the Convention issue of The Canning Trade, February 18th, 1924. In this present article Dr. Estey revises the subject so [illegible] to fruit and fruit products, and it will therefore interest a large branch of the industry, which may not have read the address when directed to pea canners.—The Editor.]

IT has long been recognized that different kinds of foods undergo different types of decomposition, such as the souring of milk, the decaying of meats, the rotting of fruits and vegetables, the molding of berries, and the fermenting of fruit juices. We are also well aware of the fact that canned foods that are insufficiently processed or packed in defective containers will spoil within a short time under certain conditions.

With the development of bacteriology, we now know the organisms that are exceedingly active in bringing about these changes, namely, yeasts, molds, and bacteria. They are too small to be visible to the naked eye, and can only be seen when greatly magnified by means of a compound microscope, hence the term micro-organisms is applied. They are the smallest living beings of which we have any knowledge, and are both our friends and foes.

The yeasts affect practically only those food substances which contain a large amount of sugar, such as fruits, tomatoes, and preserves, whereas the molds will attack all classes of foods to some extent. Although yeasts can grow in almost a saturated sugar solution, molds are still more resistant to the action of sugar solution in high concentration. They can also grow on comparatively dry material, such as cheese, bread, dried foods, etc. These two classes of micro-organisms, yeasts and molds, are not especially heat resistant, the temperature of boiling water being sufficient to destroy them in canned foods within a few minutes. On the other hand, bacteria are the most abundant and the most vigorous of the micro-organisms. They are the most serious enemy to food, bringing about different types of decomposition, dependent upon the kinds of foods and the class of bacteria acting upon it. They comprise many varieties, differing among themselves as widely as the common plants with which we are more familiar. These microscopic forms average about one twenty-five thousandths of an inch in diameter and several millions can be crowded into a mass about the size of a pin-head.

Bacteria attack any kind of food suited to their growth and multiply rapidly under favorable conditions, that is proper nutritive materials in a moist state, and held at a suitable temperature. The food requirements of bacteria vary widely. Some are able to live on dead organic matter occurring in nature, others grow in the bodies of animals and plants, and some exist under either condition. Some are able to obtain the necessary energy from certain foods, such as starchy products, while others require a nitrogenous diet, consisting chiefly of meat products, and still others can utilize inorganic material, obtaining from it sufficient nutrients. The majority of these microscopic forms grow best in neutral material, or those made slightly acid, or alkaline. There are however, certain differences between different kinds of bacteria and the same bacterium may grow in solutions containing a considerable amount of alkaline or acid. We have recently studied a certain group of organisms which is able to grow in distinctly acid solutions, such as canned tomatoes, and certain canned fruits and fruit juices. This type of organism has been found to be the causative agent in producing spoilage of these canned products when under-processed. This group is also able to grow in neutral solutions, but on account of the comparatively low heat resistance the presence of this organism is not significant in vegetable foods processed under pressure or in boiling water for a long time. Bacteria comprising this group are especially acid tolerant in that they remain alive for a long time in acid foods that have undergone decomposition. They have been recovered from spoiled canned tomatoes which have been held in an ice box for over a year.



Each bacterium grows best at a certain temperature at which, provided other conditions are suitable, reproduction takes place at least every thirty minutes. In such a case it has been estimated that its progeny at the end of twelve hours would be 17,000,000, while, if reproduction occurred once an hour, the same number would be produced in twenty-four hours. On the other hand, if held at a less favorable temperature, so that it would reproduce itself once in four hours, its offspring prevents or retards their growth.

The majority of bacteria grow best at 70 to 100 degrees F. The average canning plant during the summer months has about this temperature and affords to such bacteria conditions that permit rapid growth. The rate and extent of decomposition of raw foods depend upon the type of organisms present and the conditions under which the raw material is held. In general, however, raw products decompose rapidly at 90 to 100 degrees F. At lower temperatures, bacterial changes develop more slowly and not to such a marked degree. Hence, any steps that can be taken to reduce the temperature of the raw product while it is being held for canning greatly prevents gross contamination. This decreases the possibility of spoilage both of the raw material and, as will be seen later, of the canned product, since if growth occurs, large numbers will be produced within a short time.

For rapid growth in food, bacteria also require a certain amount of moisture. On account of this, fruit and vegetables that are thoroughly dried do not spoil. Drying does not kill bacteria, but they cannot multiply without water. This point is important in connection with the storage of the raw product at canning plants. A well ventilated place must be provided in order that the surface of the food materials may be kept dry.

Bacteria may be divided into distinct groups according to their characteristics and the functions they perform. We have for example, the disease-producing organisms which cause typhoid fever, diph-

theria, tuberculosis, etc., as compared to the non-disease-producing bacteria, such as the majority of the forms found in the soil and those active in the manufacture of cheese, vinegar and sauerkraut. Some bacteria have the power of producing different gases, such as carbon dioxide, hydrogen, and hydrogen sulfide, and these gases are responsible in the case of bacteria action for the production of "swells" in canned food. Other organisms produce different kinds of acid without gas formation, accounting for "flat sours" in certain canned foods. Also, other organisms produce both gas and acid, and this is the one in which we are particularly interested in the spoilage of canned fruits. The growth of this organism in canned fruit is manifested by the production of "swells" within a short time after the packing, and under ordinary conditions "swells would develop in the warehouse before the goods were prepared for shipment. This type of swelling in canned fruits is due to the action of specific bacteria which produce gas and shows definite signs of spoilage in the canned product. The swelling of the cans in these cases is due to understerilization of the product, and not to the subsequent action of the fruit acid upon the containers giving what is known in the trade as "hydrogen swells". In the latter case, spoilage is not present and the product usually appears normal in every respect. Furthermore, the development of hydrogen swells is delayed for a considerable period, whereas the swelling due to bacteria usually occurs within a few days in the warehouse.

There is also a marked variation in the heat resistance of different organisms, ranging from those which are destroyed by pasteurization as employed in milk, including the large majority of the disease germs, to those which are able to survive several hours continuous boiling and over ½ hour exposure to 15 pounds steam pressure. This latter group, that is, the resistant forms which can survive excessive heat, have the power to produce spores and are known as spore-bearing, as contrasted with non-sporing bacteria in which life in the majority of cases is short.

Spore-forming organisms pass iinto this dormant stage when certain unfavorable conditions arise and may remain alive for years, resisting drying and extreme cold over a long period. In this state the organisms are preserved until favorable conditions arise under which they can again grow and multiply. Spores of some varieties are capable of resisting extremely high temperatures for a long time as compared to the non-spore forms and also are many times more resistant to disinfectants, chemicals, and to all other known adverse conditions.

As far as our studies have gone we have been unable to produce spoilage in canned fruits and tomatoes by this group of organisms. The presence, therefore, of spores in these canned foods appears to be insignificant. We have, however, frequently isolated spore-forming organisms from normal cans of such products. These products however, remain normal, since the conditions are unfavorable for the germination of the spores. The acidity of these products is an important factor in inhibiting the growth of these resistant bacteria. The type of organisms we have encountered in spoiled canned fruits does not form spores. These organisms are destroyed in fruit juices at a temperature considerably below the boiling point of water, but they appear to be sufficiently heat resistant to be a factor in the processing of these acid products.

Bacteria are abundant in the cultivated soil and are present on the surface of different vegetables and fruits. When the raw material is bruised and allowed to stand exposed for a long time or have in them decayed portions in which millions of organisms are active the degree of contamination is unlimited. Such material contains suitable food material for the development of these organisms and inevitably results in a large increase of numbers of these microscopic forms. The careless disposal of waste products and spoiled canned foods are important factors in the distribution of such organisms, and contribute to the contamination of soil to the contamination of soil and premises surrounding the canning factories. The raw material may become contaminated with the same bacteria that have caused spoilage in previous years, if traces of the spoiled material are still present in the vicinity of the factories and come in contact with the raw material at the time of its preparation for canning. The examination of material obtained from different stages of the canning operation, and from machinery with which the food comes in contact show the presence of the same bacteria all along the line, and clearly demonstrates that they can easily gain access to the cans.

Our experiments on inoculated cans of different foods with spores of B. botulinus, the only known spore-forming bacterium that produces a poison in certain canned foods, definitely show that the canned acid fruits are not favorable mediums for the spore germination and poison production of this organism. These experiments, however, were performed in cans of sterile commercially packed fruits, artificially inoculated with slightly heated spores of the Botulimus organism alone, and not associated with other organisms normally present on raw fruits. Even in fruits it has been shown that bruises, worm holes, decay and other defects may make possible the growth of B. botulinus, and such portions should be removed before canning, or fruit containing such imperfections discarded. From a practical standpoint it may be stated that no outbreak of botulism for commercially canned fruit has been reported. Furthermore, it is believed that there is no danger of botulism from this source unless the raw product contains bruised or rotton portions not removed by trimming. All practical measures should be adopted to secure the highest degree of sanitation with all products and since this organism is associated with decaying plant material, utmost care should be exercised in the disposal of the waste products and spoiled materials.

We know that bacteria are ubiquitous. They are present in the air we breathe, the water we drink, the food in the raw state we eat and on everything with which we come in contact, for example canning machinery of all kinds, utensils, on the hands and clothing of the employees, in tin cans, etc. If we accept this well founded fact at the start it is obvious that in order to preserve canned fruits indefinitely they must either be so handled that the organisms that can produce spoilage in these foods cannot grow in them, or else they must be killed and subsequently contamination prevented.

The presence of a few organisms in the food at the time of processing, clearly indicates that the raw products was fresh, sound, promptly handled, and prepared in a sanitary manner. On the other hand, numerous bacteria in food material is evidence of contam-

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

ination from one or more of the following conditions:

(1) The raw material has been either improperly stored or held under improper conditions for too long a time.

(2) The equipment has not been thoroughly cleaned.

(3) Lack of cleanliness and care in the preparation of the food on the part of those responsible for it.

(4) Delay in processing after the food material has been canned.

During 1923 cases of spoilage of canned tomatoes from 14 different canning plants throughout the United States were studied and found to be due to the survival of a specific organism during the cooking. This indicates that this type of organism is widely distributed in nature. Recent work that we have done in the Research Laboratory in connection with the problem of determining safe processes for canned fruits and tomatoes, gives striking evidence as to the necessity of prompt handling and to the exercising of special care in the preparation and selection of the raw materials.

The time necessary to sterilize or process, as it is more commonly understood when applied to canning, depends upon the rate the heat penetrates into the center of the container and the time necessary to destroy at a certain temperature a definite number of the existing organisms in that particular food. Our laboratory results conclusively show that the number of organisms present in the food influences the sterilization time and that individual organisms of the same bacteria vary in their heat resistance. The effect of numbers has been consistently demonstrated in all solutions and fruit juices which have been tested. It has also been confirmed by experimental packs of over 15,000 cans inoculated with different numbers of the same organism and subjected to different processes. It has been found that the majority of organisms in any cans are not especially heat resistant and as the time is prolonged, fewer organisms remain alive until finally the resistant succumb. The number of these most resistant individuals vary in proportion to the total number present in the solution, for example: if there are 10 of these most resistent organisms present in a solution containing 100,000, there should be one in every 10,000 if equally distributed in ten sets of 10,000 each, and only one organism in ten sets in which each set contains 1,000 organisms. In other words, the chance of obtaining these occasional most resistant organisms become loss with fewer organisms in the solution. This explains why all cans of any product do not spoil when subjected to the same heat treatment. A cook which would be adequate to sterilize food containing 1,000 organisms of the same bacterium would not be sufficient for cans containing 1,000-000 organisms.

We are not in a position yet to state how many organisms may get into the can in any factory, the kinds, or their heat resistance. Conditions which as their destruction, vary in the same plant from time to time and in different canning sections. There points influence their production and multiplication, as well deserve careful consideration and much research is necessary to establish certain fundamental factors operating and controlling them which have a direct bearing on the safe processing of canned foods. We are planning an extensive investigation of the following points in connection with our experimental packs to determine proper processes.

(1) What is the source of these organisms which are responsible for the growth and spoilage of these products?

(2) How do they get into the canning plant?

(3) Are they originally on the raw material and transported at the time of harvesting into the factory?

(4) Do they come from soil or does the factory become contaminated in some other way?

(5) Does the organism remain viable between the packing seasons in the factories and continue to contaminate the food material year after year?

(6) What practical measures can be adopted to free the cannery from these organisms and thereby reduce the chance of contamination?

CONCLUSIONS.

Our experimental results warrant the following conclusion:

1. Bacterial spoilage of canned fruit and tomatoes is materially increased when the number of bacteria capable of growing in these foods is increased.

2. The amount of contamination of the raw material is unlimited when it is improperly stored and held for a long time at temperatures from 75 to 95 degrees F. Every effort should be made to hold the raw products as as low a temperature as possible. The food should be stored so that cool air can circulate freely through the material.

3. The use of fresh and sound raw material packed with the least delay insures more effective sterilization and reduces spoilage to a minimum. All bruised, wormy, decayed and moldy portions, and other defects should be removed before canning or food containing them, should be discarded.

4. All practical measures should be adopted to secure the highest degree of sanitation with all products.

TRI-STATE CANNERS TO MEET

Hotel DuPont, Wilmington, Del., May 8th, 1924.

WE are notified by Secretary Dashiell that there will be a spring meeting of the Tri-State Association at the Hotel DuPont, Wilmington, Del., beginning at 11 A. M. May the 8th, 1924. "This is not a general meeting," he says, "but will be confined to our membership only, including canners, brokers and supply men who are in good standing as to dues."

"We hope to make this a real business meeting of benefit to all. We will have up-to-date reports from the chiefs of the Farm Extension Service in each of the three States, showing what has been done in their respective States towards tomato and corn growing; from the manager of the Traffic Bureau as to what he has done for the members, and an address by a prominent member of the U. S. Farm Bureau on 'Co-operation Between Canners and Growers.' At the same time an opportunity will be afforded for a general discussion of [illegible] conditions affecting the coming season's operations. Luncheon will be served in the same room as the meeting so that there will be no delay or interruption."

This is a new departure for this Association in confining it to members and making of the session a genuine business conference, and its outcome will be watched with interest and we predict it will be a very satisfying meeting.

Labor and Crop Saving in Harvesting Peas

By H. Strycker Mills.

IN harvesting peas there are four separate and distinct operations. In order of importance in New York State these are: cutting, loading, hauling and unloading. The units of time required for these operations are: unloading, one unit; cutting, two units, and loading and hauling combined, four units.

Unloading is relatively unimportant to the grower. This is because it requires the least amount of time, which is due to the fact that most canning factories have practically eliminated the waiting lines of growers at the viners. This was made possible by providing the necessary space for unloading along the conveyors which run to the viners. The factory help handles the peas from then on.

Some have suggested the possibility of having an automatic unloader at the viner station. Some such apparatus like a hay fork and conveyor, which is used to unload hay, might be used. Whether the cost of installing and operating such a device would be profitable is a question. There are other harvesting operations far more important which need attention.

It takes longer to cut an acre of peas in a 4-acre field than it does in a 20-acre field. This is because it is necessary to turn oftener in the smaller field. For this reason it is cheaper to harvest larger acreages of peas than smaller ones. Improvements in cutting machinery for peas have had some attention. An ordinary mowing machine is generally used in New York for cutting peas. Most of the growers use the same machine for mowing peas and for haying, but some employ an old mower for peas. This is generally the practice when peas are grown on stony or in hilly country, because the growers do not want to risk good machinery on such land. It naturally takes longer to harvest peas on irregular ground, and, with the use of poor machinery it makes it doubly hard to realize profits.

Lifters are used by some growers. These are put on in place of the regular guards on the mowing machines at intervals of about one foot, or to suit the conditions. Growers using these attachments claim a saving in crop, as the finger-like rods lift the pea vines which are lying close to the ground, and makes it possible to cut those peas which would otherwise be left unharvested.

Another attachment for the ordinary mower is often employed. This is called a windrower or swather. It consists in a series of curved rods attached to the cutter bar, and rolls the peas back after being cut so that they won't be tramped on by the horses on the next trip around. Men were formerly used entirely for this work, but the swather now aids this operation considerably.

In 1920 a study of about 140 farms which grew peas showed that half these growers used a swather attached to their mowing machines. These men saved 6½ man hours and 5 horse hours per acre by using these swathers when compared with the other growers who did not use these attachments.

The modern pea-harvester, a fairly recent devolpment in the industry, is used to a larger extent in other states than in New York. Our average acreage of peas on those farms growing this crop is about 6 acres. The progressive grower will consider very carefully such items as initial cost, depreciation and upkeep, and labor saved before purchasing such a specialized machine for harvesting only 6 acres of peas a year. However, for the large grower, some of these machines seem very satisfactory. They are fitted with lifters and single or double swathers. They deliver the peas in rows or bunches back of the machine's cutting apparatus, or to one side, so that the horses on the next trip around will either straddle the previously cut row or be entirely clear of it. Manufacturers of some of these pea harvesters claim a saving in labor of over 60 per cent., and an increase in crop of 20 per cent.

In loading peas labor may be saved by employing unusual methods. Take, for example, the methods used by a grower in Cortland county. This young dairy farmer is progressive, and is always looking for new ways to save time and labor, and thus increase his profits. He uses an ordinary mowing machine with lifters attached to cut his 15 or 20 acres of peas. The next operation is going over the field with a side-delivery rake which puts up the peas into windrows. A hay-loader and ordinary hay wagon follows and picks up the peas. He thus saves considerable time in harvesting his crop of peas.

This grower is an exceptionally good one as will be shown by comparing his items of costs and returns with the average grower of peas in New York. His cost of growing was $46 per acre compared with $54 per acre for the average, a saving of $8 per acre. His harvesting cost was $14 per acre, as compared with $18 per acre for the average, a saving of $4 per acre. This makes his total cost of growing and harvesting peas per acre $60, as compared with $72 for the average grower for the year 1920, a difference of $12 per acre.

There are several other reasons besides his labor saving in harvesting which account for this growers low costs of growing and harvesting. He grows about 20 acres of peas every year while the average grower has only 6 acres. It has been shown in this State that it is cheaper to grow larger acreages of peas than it is to grow a smaller area, because there is labor saving in farm operations on a large scale. Further, he is fairly close to the viner and has only a short haul. It is obvious that it is cheaper to haul peas only a short distance to the viner station. By using good cultural methods, this grower was able to obtain an average yield of 2860 pounds of shelled peas per acre as compared with 2246 pounds per acre for the average grower for that year. It has been shown that the costs of growing peas per acre is lower for those obtaining larger yields per acre, because those growers are better growers and employ all the possible means of saving expenses in growing the crop. This partic-

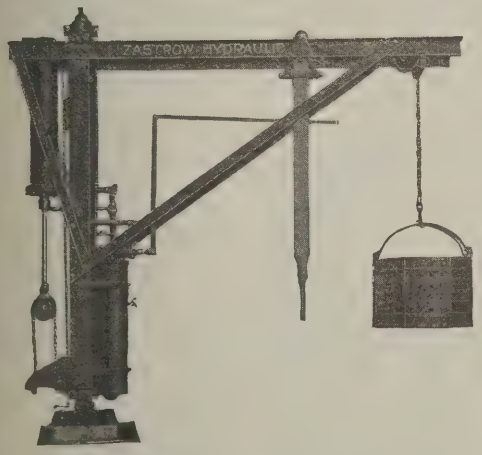
Just as We Predicted - - It Made a Big Hit.

A greater number of Canners placed orders for INVINCIBLE CORN HUSKERS at the Buffalo Convention than any Convention at which we ever exhibited, and more are ordering daily.

THE 1924 MODEL INVINCIBLE HUSKER IS LIKED FOR ITS SIMPLICITY.

The demand is going to be big, but we are prepared for it.

Corn worms cannot possibly affect the proper functioning of INVINCIBLE Corrugated STEEL ROLLS, whereas, Rubber Rolls become greasy and they cannot be sterilized with hot steam.



Steel Rolls are sanitary. That alone is a sufficient reason for you to use INVINCIBLE HUSKERS, the only all steel roll Husker.

ular grower therefore obtains better yields and is able to grow at a lower cost, because he grows a large acreage of peas, he has only a short haul to the viner station, and he uses good cultural methods and labor-saving devises in harvesting his peas. His profits are therefore greater than the average grower.

Hauling the peas to the viner is usually done on the ordinary hay wagon. Some up-to-date growers owning auto trucks, use these vehicles and save considerable time in getting their peas to the station. A grower using this method might be situated quite a distance from the viner, and still be able to get his peas to the station in a very short time, thus cutting down costs.

From this discussion, it will be seen that the better and more successful growers use labor-saving devises in harvesting peas. By decreasing the man and horse labor necessary to cut an acre of peas, to load it and haul it to the viner station, these growers save money, and, as they are generally the men who use up-to-date methods in growing the crop, they can produce the crop at a lower total cost per acre, and will therefore net a larger return per acre for the peas grown for the canning factory.

THE BROKERS FIGHT ON THE $50 OCCUPATIONAL TAX

THE Revenue Act of 1921, Section 1001, provides that "Brokers shall pay $50.00." It then goes on to define brokers as those who negotiate purchases and sales of several commodities, including "produce or merchandise".

H. R. 6715, the proposed "Revenue Act of 1924" was reported to the Senate by the Finance Committee of that body, with the recommendation that the Bill as approved by the Committee be passed by the Senate. Section 701, Paragraph 1, of H. R. 6715 (corresponding to Section 1001 of the Act of 1921) was amended by the Senate Finance Committee, at the solicitation of this Association, to read "Brokers, except brokers exclusively negotiating purchases or sales of produce or merchandise, shall pay $50.00."

This amendment exempts food brokers from the payment of an annual license fee, or "Occupational Tax", which tax has been collected July 1st each year by the Internal Revenue Bureau. It is reasonable to assume that food brokers will not be licensed again, but all danger has not been passed.

The Bill is subject to debate on the floor of the Senate and passage by that body. It is possible, although hardly probable, that a further amendment, to take away the relief so far given food brokers, may be introduced on the floor and passed. After the Bill has been passed by the Senate it will be referred to a conference committee composed of five Senators and five members of the House of Representatives. It is possible, but not probable, especially if the Senate permits our amendment to remain in the Bill, that the Conference Committee may take away this relief.

These contingencies and the course of the Bill to final enactment and the signature of the President will be closely watched. There may come a time when the active support of every member of the Association will be needed, to help hold the ground we have gained and if that time comes, it is hoped that every member will respond quickly.

HOW THEY GOT RELIEF

Says Secretary Fishback of the National Foo Brokers Association:

"When the House Committee of Ways and Mean refused to give us relief from this nuisance taxatior we carried our fight to the Finance Committee of th Senate, to which the measure was referred after i was introduced in the Senate. An effort was made t obtain a public hearing before the Committee in orde that it might be informed concerning the function of the food broker, and the wide difference whicl exists between the business methods of food broker as compared with other brokers. The Committee de cided to hold no public hearings on the Bill.

"Then a printed brief was filed with the Committe in the name of the Association, setting forth as reaso for relief from occupational taxation the work don by food brokers, the small amount of compensation, comparison between the cost of sales work throug brokers and through travelling salesmen, the fact tha such taxation was discriminatory, was difficult of equit able administration, was originally assessed agains food brokers as a war measure, and finally that th total revenue to the Government from this one iter of taxation was so small as to be inconsequential.

"Four influential members of the Senate Financ Commiittee, gave audience to a representative of you Association, until they had an opportunity to under stand the merits of our contention sufficientiy to argu in an informal manner when the question was up i the Committee. These four men belong on the hono roll of this Association. They are:

James E. Watson, of Indiana, who led the figh for the amendment in our behalf.

Pat Harrison, of Mississippi, who introduced th motion to amend the section by exempting the produc and merchandise brokers.

David A. Reed, of Pennsylvania, who supporte Senator Watson in his fight.

Charles Curtis, of Kansas, who not only supporte Senator Watson, but furnished timely informatio aiding in effective work by the representative of thi Association.

"All members of the Finance Committee shoul have the thanks of our membership, and in fact al food brokers, for accepting this amendment, but thes four men fought the good fight.

"Your representative at Washington receive timely and valuable aid from the brokers of Utah, wh wired their Senator, Chairman Smoot of the Financ Committee, urging him to give our side of the cas ample opportunity to be explained which he did. Th brokers of Arkansas gave valuable assistance by wir ing their Senator, Chairman Robinson of the Senat Minority, urging his support of our position and th use of his influence with the minority members of th Committee.

"It is anticipated that if there is a fight agains our amendment on the floor of the Senate, our cham pions, who are responsible for the amendment wil defend it against attack. You will know if they nee help, and when they need the help give it readil and quickly. It means the defense of a principle whic is right, and it means money in your pocket.

"You may be interested in knowing that through out this fight, your Association worked alone, askin for aid from none except its members and having n assistance volunteered by any other interested bodies.'

AUTOMATIC END CURLING MACHINES

This device performs the operation of curling flanged edges of sanitary type can ends, or any other work where it is necessary to curl. Its adjustability allows the chute to be set at any angle to convey the ends to curling wheels, making it adaptable for any Open Back Inclinable Press. The curling prevents nesting and is essential to automatic feeding in Compound Applying Machines and Double Seamers.

The curled edge acts as a retainer for sealing compound and facilitates operation of seaming rolls. One set of hardened rings are included, extra rings furnished for additional sizes. Only the inside rings are changed, outside rings being provided with adjustment for variation in curl. The bearings are fitted with removable bronze bushings. All parts are interchangeable and readily removed for additional sizes. Two Curlers may be arranged behind our Double Die Automatic Presses.

POSITION OF FERTILIZER IN SOIL IMPORTANT

By Soil Improvement Committee
of the National Fertilizer Association

COMPARTIVELY few farmers are able to compare, satisfactorily, different methods of crop production on their own farms. This is rightly left to the experiment stations, which have performed services of untold value since these were established.

An instance is found in a recent announcement by the New Jersey Experiment Station of the results of work done to determine the effect of placing fertilizer in various positions in the soil with respect to potato seed pieces. These results bear out the findings of other investigators, namely that the improper application of fertilizer may and often does have a decidedly adverse effect upon the yield.

A difference of as much as 78 bushels of potatoes per acre resulted from the different methods of applying fertilizer, as follows:

Method of Fertilizer Application	Yield
Above seed with soil between	128 bushels
In direct contact with seed	132 bushels
Mixed with soil in row	152 bushels
Beside seed, and on same level	173 bushels
Beside seed, but lower	206 bushels

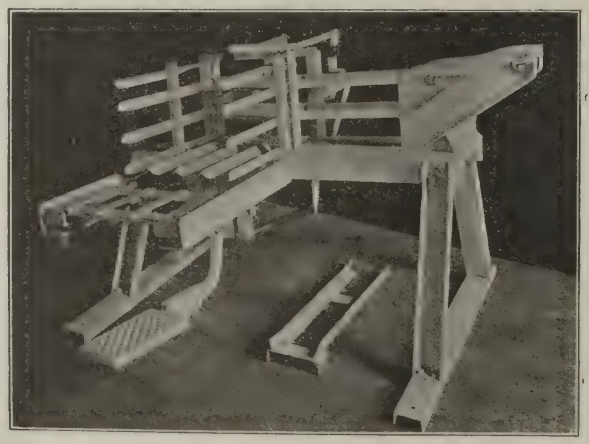
While fertilizers should be applied properly to all crops, if maximum profits are to be obtained, the necessity is particularly strong in the case of such crops as potatoes, where all the fertilizer is usually applied at planting time, and of wheat and corn which are often drilled at the same time as the fertilizer.

FIGHT THE EUROPEAN RED MITE

College Park, Md.—The appearance in large numbers of a comparatively new insect pest, the European Red Mite, will necessitate a change in the spraying operations of fruit growers in the leading apple and peach producing sections of Maryland this year.

When the European Red Mite was first observed in orchards in Harford County a number of years ago, methods for its control were undertaken by the University of Maryland Experiment Station. Investigational work, conducted by C. C. Hamilton, of the Department of Entomology, has shown that it is advisable to apply what is known as a delayed dormant spray to kill the winter eggs of the mite.

On apple trees the delayed dormant spray is usually applied in the spring when the buds begin to show silver green. Usually the spray is a concentrated solution of lime and sulphur. This year, however, a lubricating oil emulsion or a miscible oil, applied according to directions of the manufacturer, is being recommended for those sections where the European Red Mites are prevalent.



In the case of peach trees, harboring European Red Mite eggs, a lime-sulphur application, is recommended before the buds swell, followed by a lubricating oil emulsion or miscrible oil application.

"Experimental work," says Mr. Hamilton, has shown the desirability of killing the eggs of the pest rather than attempting to control the mites after the eggs have hatched. Summer control of the mites requires more thorough spraying than in usually done and in addition there is always the possibility that with favorable weather conditions the mites may increase so rapidly that severe injury occur before the infestation is noticed or can be checked.

"As shown by laboratory and field tests winter eggs of the mite can only be controlled effectively by the use of oil sprays. If properly applied most of the miscible oils and oil emulsions should give control of the winter eggs. However, experiments have shown that soap oil emulsions, both proprietary and home made, have given as good control as miscible oil, spread better over the trees and are cheaper."

"The summer stages of the European Red Mite have been effectively controlled on apple trees by the regular applications of lime-sulphur where the spraying was thoroughly done," says Mr. Hamilton, "but sprays recommended for peach trees have failed to give good control. The use of the oil spray during the dormant period is therefore important in the case of stone fruits."

The KYLER Boxer

We're Ready to be Judged by What Users Say about KYLER Boxers.

See the KYLER Boxer in operation - we sell them by the way they perform in factories like yours. Ask any KYLER Boxer owner anywhere; ask his superintendent, his operator.

Ask any man in a position to know about KYLER Boxers performance. What these users tell you, we will abide by. A pretty fair barometer by which to choose your next Boxer. May we send you more details?

HAMACHEK IDEAL VINERS

Hamachek Ideal Viners during the past seven seasons have demonstrated their superiority under all conditions. Their use insures more thorough hulling, on any condition or variety of peas or beans, than is possible with the use of any other viner.

Frank Hamachek Kewaunee, Wisconsin

Manufacturer of Viners, Viner Feeders and Chain Adjusters. Machinery Manufacturer Since 1880

Eggs of the European Red Mite are reported to be present in sufficient quantities in most orchards in the Hancock, Hagerstown, Smithsburg, Frederick, Westminster, and Harve de Grace sections to necessitate the use of the oil spray, it is said. Eastern Shore orchards are not so heavily infested.

FREIGHT RATES & SHIPPING NEWS

Traffic Bureau

THE CANNED GOODS EXCHANGE OF BALTIMORE

Consideration is being given by the railroads to increasing the present rate on pickles in bulk, in wood, between New York, Philadelphia and Baltimore on the one hand, and Norfolk, Richmond, Petersburg and Old Point Comfort, Va., on the other hand, by establishing in lieu of the present rates the same rates as are now carried between the same points on canned foods. The proposal is now on the docket of the Trunk Line Association.

Effective May 12th, the Pennsylvania Railroad will apply from Baltimore to various western destinations served by their rail and lake service sixth class rates on paper labels, printed, but not lithographed or embossed, when in carload lots, instead of the fifth class rate, as is provided by the official classification.

Railroads in official classification territory are again proposing to increase the less than carload classification on canned fruit, jam, jellies, preserves, olives, mincemeat, pickles, table sauce and fish, when packed in metal cans, to third class instead of Rule 26, as at present. The proposal does not include canned vegetables in tin. Justification offered by the railroads for this change is to bring the less than carload rating on these articles into conformity with the relationship recently recommended in a tentative report by the Interstate Commerce Commission, with the rating on the same commodities when packed in glass. In a complaint filed by the Indian Packing Corporation, the National Food Packers Association and the Glass Container Association of America, seeking lower classification rating on articles packed in glass containers, the recommendation of the Interstate Commerce Commission's Examiner was that the classification rating on articles packed in glass, less than carloads, should not exceed the ratings applicable to the same articles in metal cans by more than one class. This proposal has been vigorously opposed by the Traffic Committee of the National Canners Association to the railroad Classification Committee, and the protests made known to the Interstate Commerce Commission.

SPRAGUE-SELLS

Sprague-Sells Peeling Table

No cutting—no fitting of tops and parts

The great difficulty with Peeling Tables in the past has been the tremendous amount of labor and grief involved in installing them. Cutting, fitting, and considerable cursing, then more fitting and cutting—doing work that should have been done in the manufacturer's plant.

To eliminate trouble for you, Sprague-Sells Peeling Tables are now entirely assembled in our factory, operated and thoroughly tested, then knocked down and shipped in sections complete with all bolts, screws, and other parts required. Adjoining sections are carefully marked and numbered, and the shipment comes to you accompanied by a simple erecting diagram, so that even unskilled help can quickly and easily set it up on your floor.

Furnished with plain steel top—or with acid-proof enamel top.

We recommend the acid-proof enamel job. Its original cost is slightly greater but the absolute freedom from corrosion resulting in much longer life, and the fact that this enamel finish is so easy to keep clean and sweet, certainly warrants the extra investment.

Frames, tracks and trucks only may be purchased if you wish to build your own tops of wood.

All our machines are guaranteed to satisfy you—your money back if they fail to do so.

NORWEGIAN SARDINE FISHERMEN DISAPPOINTED.

THE season just closed was the poorest experienced in many years by Norwegian sardine canneries, reports Consul George N. Ifft, Bergen. The pack was about 400,000 cases, as compared with a normal production of 1,000,000. According to a statement just received by the Department of Commerce, the total Norwegian catch of bristling, mossa and other small fish packed as sardines amounted to about 70,000 hektoliters. During the later part of the season the Bergen sardine canners received shipments of bristling from Scotland, which were said to be first-class and fully as cheap as the home product. For several weeks the Stavenger canners received most f their bristling from the Danish coast, where the fish appeared in great shoals. Many Norwegian fishing gangs, disappointed with the catch in Norwegian waters, moved their equipment off the Danish coast.

A REFLECTION

Gazing at one's self in the mirror is by no means an indication of vanity. In many cases it is humor.—Boston Beanpot.

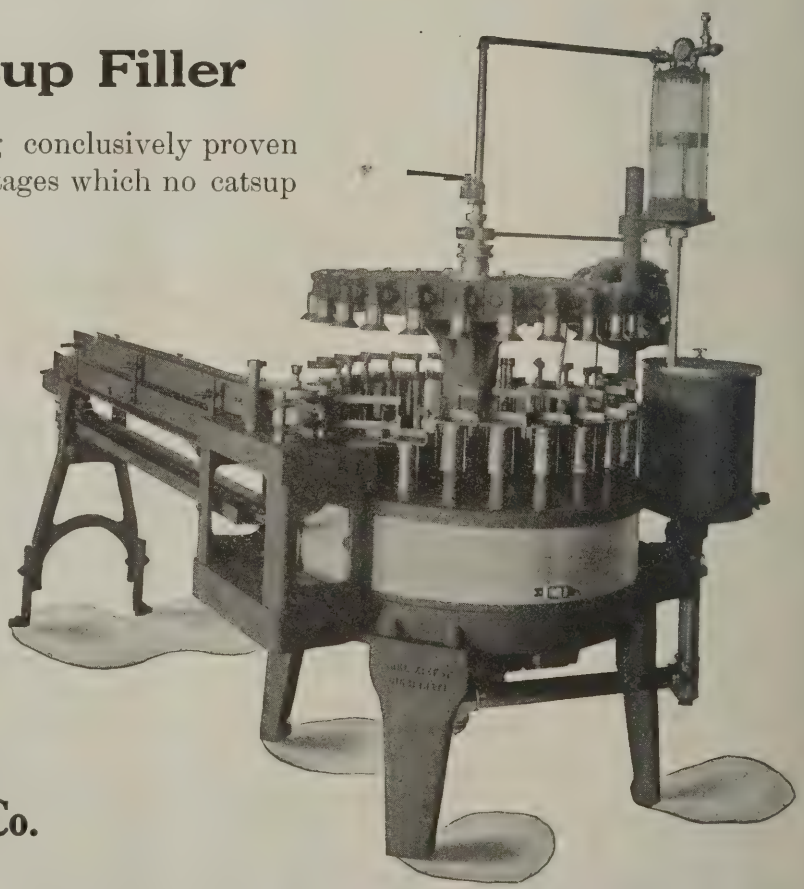
"Is your chauffeur economical?"

"Very; he never runs the car on more than two wheels or three cylinders."—Phoenix.

The Kiefer Catsup Filler

The new Kiefer Catsup Filler, having conclusively proven its worth last season, presents advantages which no catsup bottler can afford to overlook.

It fills without slop or waste and will not deposit catsup in broken bottles.

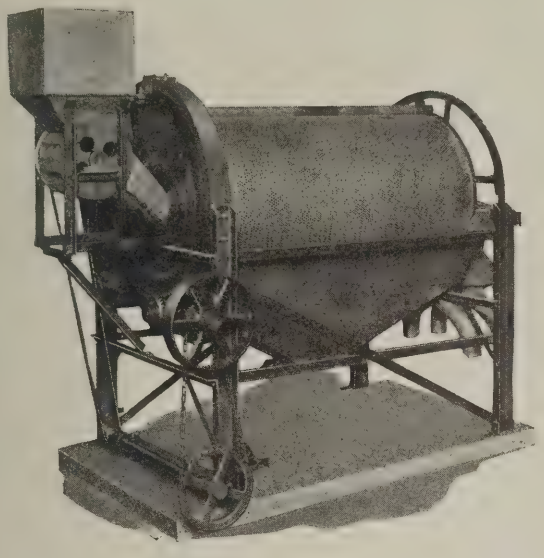


There is no perceptible loss in temperature when filling.

Metal contact is reduced to a minimum.

Nothing to take apart when cleaning at the end of the day's run.

We are willing to prove these things to you in your plant. Many manufacturers have already placed their order for this season.



Get your order in before it is too late.

The Karl Kiefer Machine Co.

Cincinnati, Ohio.

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grades, and Other Canning Machinery.

THE BEST IS THE BEST.

The best is the best the whole world over.

It is also true that in an increasing number of successful canneries

Wyandotte Sanitary Cleaner and Cleanser

is conceded to be unequalled for sanitary cleaning as well as most economical to use.

Quality must be protected — Wyandotte Sanitary Cleaner and Cleanser cleans so quickly and easily and rinses so freely that the pure wholesomeness of canned foods is safely guarded.

Indian in circle

in every package

Equipment costs money — Wyandotte Sanitary Cleaner and Cleanser does not attack equipment but insures longer life and usefulness.

Workers must be satisfied—throughout the constant cleaning work necessary in the production of canned foods Wyandotte Sanitary Cleaner and Cleanser is always pleasant to use.

These proved factors of quality, service and economy should justify you placing an order with your supply house.

The J. B. Ford Co. Sole Mnfrs. Wyandotte, Michigan

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE CANNING TRADE, published Weekly at BALTIMORE, MD., for April 1st, 1924.

State of MARYLAND, city of BALTIMORE, ss:

Before me, a Notary Public in and for the State and city aforesaid, personally appeared ARTHUR I. JUDGE, who having been duly sworn according to law, deposes and says that he is the EDITOR and PUBLISHER of THE CANNING TRADE, and that the following is, to the best of his knowledge and belief, a true statements of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, ARTHUR I. JUDGE, 107 S. FREDERICK ST., BALTIMORE.

Editor, ARTHUR I. JUDGE, 107 S. FREDERICK ST., BALTIMORE.

Managing Editor, NONE.

Business Managers, NONE.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

ARTHUR I JUDGE, 107 S FREDERICK ST., BALTIMORE.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (if there are none, so state.)

THERE ARE NONE.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner: and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

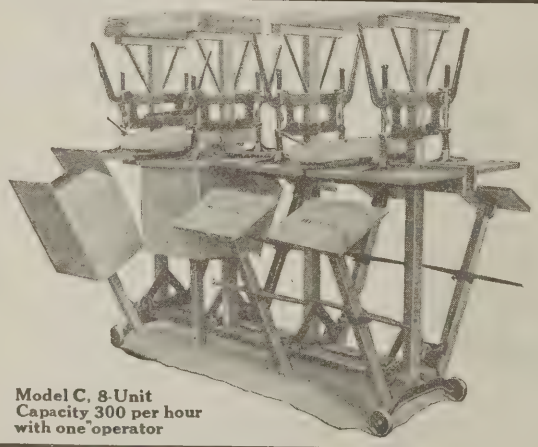
5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is..... (This information is required from daily publications only.)

ARTHUR I. JUDGE.
Signature of Editor and Publisher.

Sworn to and subscribed before me this 5th day of April, 1924.

(SEAL) W. B. EVANS, Notary Public.

My commission expires May 5, 1924.



Otto—Gee, I made a bad break at dinner last night!

Ditto—Don't tell us the one about the cracked plate!

Otto—No! Mother asked me if I wouldn't have some more corn. I said, "Sure!" and—passed my glass.—Black and Blue Jay.

Clerk—These are the best oysters we've had for a year.

Customer—Let's see some you've only had for six months.—Pelican.

Do You Know

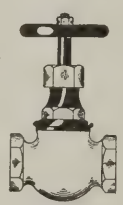
— that PROTEXU CANNERS APRONS will save you money because they are **low in price, unusually durable,** and afford **greater protection** for your employee?

Scientifically constructed of fine, strong fabric, amply coated with tough, elastic, **wear-proof rubber,** Protexu Aprons are especially designed for all canning operations. Hundreds of canners use them exclusively, finding them **most economical.**

Moreover, Protexu aprons are **soft, flexible, lightweight** and extremely **comfortable** to wear. Made in any standard or special size, with or without bib.

COLORS: Black or White
30" x 38" — $12.00 dozen
38" x 44" — $15.00 dozen

Send trial order TODAY — and learn how much apron service you can buy for your money. **Maximum protection** at **minimum expense guaranteed.** In ordering, please mention style and size desired. Samples of fabric, showing quality, on request.



BEAR BRAND APRONS, another popular style (grey), **large in size,** and weighing only **16 ounces,** costs **$15.50 dozen.**

William M. Gross.

Makers of all styles aprons for all industrial purposes

The Markets

BALTIMORE, APRIL 28, 1924

WEEKLY REVIEW

Politics Playing "Hob" With Business Generally—Its Results as Now in Evidence—The Market Remains Unchanged—Good Weather Permits Pea Planting and Crop Preparations—Futures Quiet.

THE POLITICAL PLOT—The old bugaboo of a Presidential year is being made much of, and we are beginning to hear about it from all sides and from every section. The whole nation is neuresthenic enough to bring about the bad business conditions which they are told always result from a presidential election year. We may talk about the hard-headed business man, the common-sensed business man, etc., etc., but even they set up before them this prospect, and keep it so constantly in mind that they will direct their course to it inevitably. You know you can give yourself a toothache by constantly thinking about it, and that is just what business is doing now with this election myth. The politicians are back of this, because they do not want to lose their influence; they do not want business to get away from their influence, and so they are indirectly but industriously keeping this doleful reminder before all business. This whole nasty mess at Washington has its incentive in politics, each one trying to throw the mud upon the other, and all of them getting a very just and proper share of it. As Mr. H. W. Phelps, of the American Can Co., said at the Western Convention in Chicago this week, if we, as an intelligent people, do not kick out of Washington the blundering blatherskites we have there for the past few years, we will not deserve, as a nation, to be saved; and he was not referring to either political party or to the head of the Government, but rather to the two houses who have given such a sad spectacle of mismanagement, or rather no management at all. We have not quoted Mr. Phelps' words, we have merely given his thought. Mr. Phelps' exact words were:

> "Irrespective of politics or religious creed or anything else, if the people of the United States do not clean out that Congress and that Senate, and put some men there who have sense enough to do what they are put there for, they are bigger fools than I think they are going to be. I used to take off my hat to a Senator; I used to walk into the Senate gallery with my hat in my hand, almost as I would into a cathedral. I wouldn't go in there today unless I was dragged in. I would be ashamed of myself for being there, and I would be ashamed of every other man that was there. I honestly believe today that if there is one duty before the American people more than anything else, more than the duty to elect the right man, or the wrong man, for president, it is, irrespective of party, to get a clean, sensible, industrious Congress that is going to let up on investigations, reduce taxes, and make a few laws, and a very few laws, that are safe and sane, and then shut up and go home. I don't think they can do anything better than that."

And every thinking man will heartily agree with this big, brainy business man and pray that this result may be accomplished. But, if it is, is there anything in such a favorable house-cleaning for business to be depressed over? There is not, and this "presidential year" talk of the politicians should be thrown into the same sweepings as those gathered in the house-cleaning at Washington.

WHAT IT MEANS—You may think that these columns are not the right place for political discussions of the above kind, but if you do you are not thinking straight. The condition we have mentioned has resulted in a curtailing of market operations in canned foods; has made the hand-to-mouth policy of buying we now see, and has made the selling of further futures very doubtful. The lack-business bankers have been very busy warning all lines of industry "not to make commitments far into the future," which in our language means not to buy futures, and so there has come a slowing-down and a hesitation in all lines of business, and canned foods cannot be free of this. This political matter has a most direct and important place in our market consideration, and unless the movement is checked, and the politicians exposed, it will go on influencing business in an adverse way.

THE MARKET—Instead of the spot market on all canned foods being buoyant and advancing in prices as the slight holdings vanish and demands remain to be satisfied, it is moving along in the same quiet way it has been doing for some months, the puzzle of all old market students. No. 2 spot tomatoes, it is true, have moved up to $1.00 in the quotations, or we might more correctly say, resumed this figure, but No. 1's have slumpeed back to 60¢, and that is the sum and substance of the market activities to record this week. And this in the face of the best clean-up the canned foods market has ever seen. Of course, the record "highs" in all canned foods in years gone by have occurred in May or early June, and they may be witnessed again this year; but the unsatisfactory condition of general business does not make this very hopeful. There is a slowing down of labor; unemployment is growing; there is an unmistakable tightening of the purse strings on spending, and the consumers are beginning to deny themselves for the first time in some years. This is not pessimism. The outlook for business, we consider, was never so bright as it is today, if this political influence could be removed.

The condition of all spot goods is reviewed in our markets, and these conditions are so much alike in all sections that it is not necessary to repeat here.

CROPS—The fine, spring-like weather that has prevailed in almost ebery section has permitted the planting of peas on a large scale and the canners of that article begin to feel a little more comfortable. This does not mean that the entire pea crop has been planted, because it will reequire about a month of good weather to permit the proper planting in New York State and Wisconsin. But so far the season has developed quite

well and preparation of the ground for all crops is in progress.

In addition to our regular market reports from all leading centers, you have the opinions of the brokers in many sections, with their price quotations on both spots and futures, and this will give you the idea of the market which you seek.

NEW YORK MARKET

Market Steady to Firm—Futures Look More Attractive—Market Waiting the Consent Decree Matter at Washington—No. 2 Tomatoes in Heavy Demand—Bad Action of Some Future Tomato Sellers—Prices on Future New York State Fruits—California Fruits Advancing—Futures Feel Good Inquiry—Asparagus has Sold Well — Trade Items.

New York, April 24, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

THE Market Situation—Has remained steady to firm for the entire line. Wholesale grocers and chain store distributors have been in the market throughout for small quantities of spot stocks, and the main problem is still in locating the offerings of the wanted goods. Last Friday, Good Friday, was observed as a half holiday by many members of the trade, and the entire Holy Week period had rather a quiet effect upon the market.

Futures—The outlook is favorable for practically all lines of future canned foods. Buyers, realizing that the position of the market for new pack is strong statistically, because of the clearance of the carryover, are operating rather freely on future items, to insure for their trade an adequate supply during the fall and early winter months.

Washington Developments.—Canners and brokers are watching with interest proceedings in Washington in the famous Consent Decree case. The latest move on the part of the packers, in seeking to have the decree declared null and void, had given rise to the belief among many that perhaps Swift and Armour may be planning to re-enter the wholesale grocery business. Some of the local trade formerly did a large business with the packers, when the latter were handling groceries, and the prospect of again having these large buyers in the market is interesting, to say the least.

Spot Tomatoes—There is evidently a shortage of No. 2 tomatoes in distributors' stocks, and much of the demand for spot tomatoes during the week has centered on this size. The market for packers' labels is still quoted at 97½ cents, but $1.00 looks like the next stop, and that right speedily. No. 1s tomatoes are held unchanged at 62½ cents, with 3s at $1.40 and 10s at $4.65 to $4.75 f. o. b. cannery. Indiana and California are not offering tomatoes in any quantity, and both of these markets are above the Eastern market basis.

Future Tomatoes—Some of the tomato canners appear to be holding back the market for the remainder, through over anxiety to get future business on their books just now. Such canners will do well to remember what happened in peas in Wisconsin this year—those that rushed the market sold at prices 5 to 15 cents under those which the later sellers obtained. With mid-west and coast tomato packers showing firm views; with the carryover of 1923 pack Tri-States a negligible factor, it is difficult to figure the actions of some canners, but 'twas ever thus, and in all probability, 'twill continue so. In any event, the market is quoted an 100 per cent. delivery contracts at the following range: Standard 1s, 55 cents; 2s, 85 cents; 3s, $1.25; 10s, $4.00.

Tomato Puree—Future No. 1 tomato puree made from trimmings is offered by one factor at 47½ cents per dozen, this being carlot price. The spot market for puree is quoted at 55 to 57½ cents for 1s. Stocks of puree held in the local trade are not very heavy, and there is some buying interest shown.

Salmon—The market on reds on the Pacific Coast is strengthening a trifle, and $2.30 appears to be the inside price now for shipment on reliable brands, with pinks unchanged at $1.25. The New York market is quiet, spring buying not yet having opened.

New York State Fruits—Business is being booked on 1924 pack New York State canned fruits, opening prices having been made by several packers. Prices are: Fancy red raspberries, $2.50; choice, $2.35; fancy black raspberries, choice, $2.40; fancy Bartlett pears, $2.50; choice, $2.25; fancy red pitted cherries, $2.75; choice, $2 50, all for No. 10 tins. On No. 10 fruits the market is: Fancy Bartlett pears, $12.00; choice, $10.50; red raspberries, fancy, $12.50; choice, $10.50; red pitted cherries, fancy, $14.50; choice, $12.75; black raspberries, fancy, $13.25; choice, $11.25.

California Fruits—The market on 1923 pack fruits for shipment is steadily strengthening as canners' holdings are depleted. Standard cling peaches are unobtainable below $1.85, and most holders quote $2.00. Apricots are strong at $1.70 to $1.75 on standards, with choice at a range of $2.10 to $2.40 Bartlett pears, standards, command $2.75, with choice anywheres from $2.85 to $3.00. Free peaches hold at $1.65 for standards and $2.05 to $2.15 for choice, all of the above being in No. 2½ tins. For No. 10 pie fruits the market is likewise firm, with stocks very light, particularly on pie fruits. Choice 'cots are listed at $8.50 with standard at $7.50, seconds cleared, and solid pack pies at $4.75 to $5.25. Cling peaches are firm at $4.50 on s. p. pies, sold out on seconds, $6.50 on standards and $7.50 on choice.

Future California Fruits—There has been a good inquiry for the items on which prices have already been named, and buyers are showing considerable interest in the general line. Private label jobbers are getting together with the packers from whom they usually buy, and are understood to have booked s. a. p. The outlook is rather strong for the entire market, both because of the close cleanup of the carryover and because of rumored crop damage this season.

Asparagus Has Sold Well—Sales of new pack asparagus have been good, so good in fact that the California Packing Corporation announces that it is entirely sold out on 12 sizes and grades. Formal opening prices have been named, and while higher in some respects than the trade had anticipated, it is not believed that there will be any difficulty in moving the pack into consumption as a result.

Maine Corn—Packers continue to quote futures nominally unchanged at $1.70 on Golden Bantam and $1.45 on fancy Crosby. Few of the packers are looking for additional business at this time, however, as the market is well sold up.

Sardines—Legally the new sardine fishing and canning season in Maine is open, but that is far as it goes. The run of fish as yet is not sufficient to warrant the packers opening their plants. Practically the entire carryover of 1923 pack has been cleared, and the 1924 production will come on a bare market.

Peas—Spot demand continues active, with the market strongly held. Futures also continue to attract attention, a steady undertone prevailing. Planting is late this season, both in the Tri-States and in Wisconsin and Illinois.

Trade Items—J. T. Adams of Adams Bros. & Sellers, fig canners, of Houston, Texas, was in the market this week.

H. G. Coykendall, president of Coykendall, Inc., Berkeley, Cal., advises that his concern is adding canning operations to their business, and will operate a fruit cannery this season. Mr. Coykendall, who was for a number of years general manager of the California Prune and Apricot Growers' Association, is a large dried fruit packer.

H. G. Maxon, general manager of the F. E. Booth Company, canners, with headquarters in San Francisco, was here during the week. F. E. Booth Company have added pineapple to their line.

Business is being taken on future California peas at $2.75 for fancy 1 seive, $2.35 for 2 seive, $1.95 for 3 seive, $1.65 for 4 seive and $1.45 for 5 seive, May-June shipment, f. o. b. California cannery.

CHICAGO MARKET

Market Gives Way to Big Convention—Many Ex-Presidents of National Association in Attendance—H. W. Phelps and Roy F. Clark Deliver Excellent Addresses. Western Association Expanding Greatly—Convention Notes.

Chicago, April 25, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

THERE is no Chicago market to report. The canners, buyers Convention, and haven't had time to report to me the condition of the market, for they have been too busy shaking ers and brokers are all attending the big Western Canhands and talking to the canners. Therefore, I will confine this communication to some of the high lights of the convention.

There were seven National Canners' Association ex-presidents at the convention and one national secretary. The ex-presidents were L. A. Sears, Walter Sears, Richard Dickinson, Frank Gerber, James Moore, James A. Anderson, Harry Stras-

baugh. They all made little short heart talks to the convention except James Moore and Harry Strasbaugh, who had gone to their trains before they were called to speak. Then Roy F. Clark, who is now president, was in attendance, so that makes eight presidents and ex-presidents of the National Canners Association who is now president, was in attendanc, so that makes eight present at the convention.

The address of H. W. Phelps, on "Current Events," was pronounced the ablest ever delivered before a canners' convention on a general subject, and it was delivered in fine style. Mr. Phelps has a magnetic and pleasing personality and excellent voice, and his matter was mixed with brains.

The address of Royal F. Clark at the afternoon meeting of Wednesday is said to have been the finest and most thorough address from a canner's standpoint that the members of the Association have heard for a long time. Do not fail to read it when it is published.

The Western Canners Association is growing rapidly and now has about 360 members. It reported 104 new members a year ago, and 49 new members at this convention for 1924. The membership now extends into eighteen states.

The new members taken into The Western Canners Association this year just closed includes some of the largest canning establishments in the United States. Among the number is the Sauk City Canning Co., Sauk City, Wis.; Big Stone Canning Co., Ortonville, Minn.; Holland Canning Co., Holland, Mich.; S. Van Allen Canning Co., Ogden, Utah; Big Four Canning Co., Eau Claire, Wis.; Dexter-Farmer Canning Co., Dexter, Ia.; Ripon Canning Co., Ripon, Wis.; Jackson Canning Co., Jackson, Wis.; Lange Canning Co., Eau Claire, Wis.; The Miami Canning Co., Lebanon, O.; The Tecumseh and Plainville Canning Co., Washington, Ind.; The Lake Odessa Canning Co., Lake Odessa, Mich., and others.

The election takes place tomorrow, after this news is written, and the association, under its constitution, elects an entirely new set of officers and directors every year. All have to be elected or re-elected, and the result of the election is not yet known. It is thought that President Hill may consent to serve another year, but he now says that he will not, and that the presidency should go to some other state, he having held it for two years.

Arthur P. Williams, of New York city, wholesale grocer, ably represented The National Wholesale Grocers Association, President Herscher being unable to come. Mr. Williams is one of the most beliked wholesale grocers among the canners, and all others who know him, in the United States, and the big house of which he is the head is regarded as the friend of the canning industry.

C. E. Wilcox returned from the Pacific Coast just in time to attend the big convention and show the friendliness of Sprague, Warner & Co. for the canners and their industry. He is looking and feeling fine after his trip.

The address of E. E. Finch, president of The Canning Machinery and Supplies Association, was forceful and candid, and the convention listened to it and liked it. He is an impressive and a happy speaker.

Charles P. Whiteman, president of The National Food Brokers Association, was in fine fettle, and made one of those "hand over your shoulder" talks to the canners for which he is noted. His address was well delivered and warmly appreciated. He has made a fine president of his association, and it is growing in numbers and usefulness under his leadership.

Sol Westerfeld, of Chicago, splendidly represented The National Association of Retail Grocers of the United States. He is one of the clearest thinkers in that big association, and does it credit whenever he appears for it. He is a practical merchant and knows his business and how to tell his thoughts. The convention is but half over, and I cannot tell about the results of it or mention all the splendid addresses in this short letter. I am pressed for time, being secretary of the association, and having all the convention details to manage. I must, therefore, defer further items of interest until next week.

Frank Gorrell, secretary of the National Canners Association, was called by President Hill. He came before the convention and said that he was first elected to his position 17 years ago, and that the directors called him before them and asked him: "Can you make a speech?" to which he answered, "No." Then they said: "For that reason you are elected secretary." And that he had tried to follow the advice so suggestively given, and was not going to depart from the policy on this or any other occasion. Then there was much applause as he sat down.

ST. LOUIS MARKET

Market Lacks Interest—Buyers Going Along Slowly—No Speculative Impurse—More Attention Expected—Tomatoes Taken as Needed—Hotel Demand for No. 10 Tomatoes Expected—Corn Steady—Fruits Will Be Higher.

St. Lous, Mo., April 24, 1924.

By "Missourian."
Special Correspondent "The Canning Trade."

PACK of Interest—Distributors are not showing the interest expected, either in spots or futures. The result has been that business in the canned foods lines has been rather quiet during the past week. This is due to the conservative policy being followed by all distributors. The majority of jobbers are taking goods mainly for nearby wants and in spite of the fact that they have not the goods they need, they do not seem to care to buy in advance, freely, for later wants even though there is a hardening in values, restricted stocks of most items and probabilities of advances over last year in future packs. The prospect of no cheaper futures, would naturally favor the buying of good packs of favorite grades of staples for speculative purposes, but there is little of this going on.

Retailers have not been featuring canned foods to any great extent except during the past few weeks on Lenten specialties because the grocery trade has been working on Easter lines such as nuts, and other goods, which are high priced, consequently the retailer's capital has been more or less tied up. From now on, many operators believe, that now that Easter is over, there will be a broader demand for canned foods and more attention will be given to staples.

Tomatoes—There is not much interest being shown in either spot or future tomatoes. The same old policy of hand to mouth buying still continues. No. 2s and No. 3s are steady in price, but prices are fluctuating on No. 10s. Most of the demand appears to be for smaller sizes, particularly No. 2s. Factory stocks are getting lower all the time and are nearly closed up, particularly on No. 2s. It is said very few unlabeled No. 2s are left. They are quoted at about 95 cents f. o. b. factory. Some canners, however, will not let go under $1. No. 10s are being kept in warehouses for spring stocking up of summer hotels and resorts. Futures are not selling very rapidly as their prices are considered too high.

Peas—The most popular grades of peas are nearly closed up. There is little change likely in the market until the new pack comes in unless prices stiffen as the stocks get lower. Some undesirable lines are still in the hands of the canners and distributors, but there is little call for this class, if others can be obtained. Even these are getting scarce. Futures are about as firm as spot and there are few available from first hands.

Corn—Standard corn is steady with no special demand except for replacement purposes. Fancy lines are scarce and are at a premium and there is not enough to allow free selling. It is said that future bookings are not as heavy as they were compared with a year ago at this time. Dealers have covered to some extent, but are not buying in large blocks, but they are pursuing a "watching and waiting" policy.

Fruits—A strong market on spot stock is practically certain. Futures will show advances over last year's openings. The cause for this will be costs of packing and higher prices for raw materials are given for the reasons for the expected advance on 1924 lines. It is said that the packers are trying to keep the market down to that point where consumption will not be effected by a too radically high opening market, but there is little faith being put in this claim by the buyers who says he will buy if the prices appeal to him, but if not he will take his chance on the opening market when he needs any goods. There is a better demand for spot goods, but the spot movement has not been stimulated as has been anticipated.

CALIFORNIA MARKET

Weather About Ideal for Crops—First Damage About Over—Hoof and Mouth Disease Spreading—Goods Embargoed —New Prices on Asparagus—Stocks of Goods Very Small—Oppose Name on Label Bill —To Stop Packing Pineapple Cores.

San Francisco, April 24, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

CROPS—Ideal growing weather for almost all crops has been experienced of late throughout California, the cool period having been succeeded by higher temperatures. Additional rain is badly needed, but the season when this is to be expected is rapidly passing. Further damage from frost is scarcely to be expected, although there have been killing frosts as late as May. The California fruit crop will be badly spotted, according to present indications, with some districts reporting prospects for a full crop and others almost a failure. Peaches have suffered more than other fruits and most of the damage has been done in the counties producing the bulk of the State's output of clingstones.

The Hoof and Mouth Disease—Despite the strenuous efforts of State, Federal and county officials the hoof and mouth disease among cattle is spreading. Nine Western States have placed a ban on shipments of California fruits and vegetables and this is commencing to affect business in general quite seriously. Farm products that ordinarily find an outside market are being dumped upon local markets and prices are sagging. The Canners' League of California is keeping in close touch with the situation and is advising members of all changes in embargo regulations. Even canned foods are banned by some communities, fear being expressed that in some manner the disease might be spread through containers. Should the embargoes last for any length of time very heavy losses to agricultural interests will result. Shipments of fresh asparagus are being curtailed, but, fortunately for growers, canners are in a position to care for everything and would be glad of the opportunity of handling the entire crop. In other lines the closing of outside markets would be nothing short of a calamity.

Asparagus—The California Packing Corporation, which issued tentative opening prices on canned asparagus several weeks ago, has recently put out its formal opening list, which differs in many particulars from the tentative one. A few items are lower, several are unchanged, but quite a few are higher. The formal list is presented as follows:

No. 2½ Square	White		Green
Giant	$4.00		$3.75
Giant Peeled	5.25		5.00
Colossal	3.85		3.60
Colossal Peeled	4.85		4 50
Mammoth	3.85		3.60
Mammoth Peeled	4.85		4.50
Large	3.85		3.60
Large Peeled	4.75		4.40
Medium	3.65		3.50
Ungraded		$2.90	
No. 1 Square			
Tips, Colossal	4.20		3.90
" Mammoth	4.15		3.90
" Large	4.10		3.90
" Medium	4.10		3.90
" Small	4.00		3.75
" Tiny	3.75		3.50
" Ungraded		3.40	
Picnic Tins.			
Tips, Mammoth		2.20	
" Large		2.10	
" Medium		2.05	
" Small		1.90	
" Tiny		1.80	
No. 1 Round, Small	2.15		2.00
No. 1 Round, Tiny	2.05		1.90
No. 1 Round, Salad Points.		3.00	
No. 2½ Soup Cuts		2.40	
No. 10 Soup Cuts		7.50	

Stocks Very Small—Carry-over stocks of California canned fruits are getting down to small compass, with sizeable lots to be had in only a few grades. Prices have been advancing steadily of late, with most packers asking at least 10 cents a dozen more for Standard cling peaches than was the case a month ago. Buying has eased off a little of late, but the distributing demand is held to be steady.

Salmon—A close cleanup on canned salmon before the new pack is available is forecasted by Pacific Coast interests. The supply of Pink salmon is comparatively light and it is expected that stocks of red salmon on hand can be moved by the middle of July. The domestic demand is quite good, but the export demand is weak. Pinks are being generally quoted at $1.25 while red salmon may be had at $2.15, although some interests are holding out for a little more.

Oppose Name on Label Bill—A joint meeting of the Board of Directors and the Executive Committee of the Canners League of California was held at the headquarters of this organization at San Francisco the middle of April and the Johnson, "Name on the Label" Bill was given attention. The meeting resulted in a telegram being sent to the Chairman of the House Committee on Interstate Commerce, Washington, D. C., as follows:

"We are just advised hearing on Johnson Name on Label Bill comes up April 15th. At meeting our Board of Directors and Executive Committee held today I was instructed by unanimous vote to wire your Committee that in our opinion a law requiring the name on the label would seriously disrupt the present orderly marketing of our product without any compensating advantage to the public. Many wholesale grocers and chain stores merchandise their own brands, and in the course of a year purchase from many different canners, and it would be an expensive and almost hopeless task to print up separate labels. We respectfully urge that this unnecessary burden be not put upon the industry. The Canners League is a trade organization composed of more than three-quarters of the fruit and vegetable canners of the State." (Signed) Preston McKinney.

Immediately action was necessary if the position of the Canners League was to be of record and it was impossible to get the ideas of the entire membership. The fact, however, that the membership of the Board and Executive Committee was unanimously in favor of the telegram as worded caused officials to feel that it properly reflects the opinion of California canners.

Pineapples—The packers of Hawaiian pineapple, who have ever been ready to make changes which would bring about a better canned product, have reached an agreement to discontinue the packing of pineapple cores for human consumption. At one time cores were used to a considerable extent in crushed pineapples, the percentage later being greatly reduced. More recently cores were packed for the use of confectioners and were employed for candy centers. Now they are not to be packed at all, a forward step that cannot but be of benefit to the industry.

The California Packing Corporation has installed a new peaviner plant at its Marvin Meadows Ranch, near San Francisco.

The Meyerberg Evaporated Milk Company, of San Francisco, has arranged to erect a milk products plant at Ripon, Cal., at a cost of $100,000, and plans to have it in operation some time in August.

The plant of the Sunical Packing Company at Oroville, Cal., has been taken over by the Virden Packing Company and will be used for packing a general line of fruits, as well as olives.

SEATTLE MARKET

Market Broadening—Reds in Good Demand—Spot Stocks Limited —Labor Troubles in Salmon Crews—Business Improving in Fruits — Some Hope for Exports.

Seattle, April, 24, 1924.

By "Nomlas"
Special Correspondent "The Canning Trade"

THE MARKET—There has been little or no change in the general market situation during the past week, insofar as prices are concerned, although the demand is somewhat inclined to broaden out. Buyers of reds are finding it difficult to get orders accepted here under $2.30 on the so-called outside brands, although some can still be picked up here and there at $2.25. The larger operators continue to hold the market firm at $2.35 f. o. b. Pinks remain steady on the basis of $1.25 f. o. b. Seattle, and there is a little disposition shown by the trade to buy in larger quantities. Chums remain in small supply and are nominally unchanged at $1.20.

Distributors' Holdings—Reports received here indicate that the stocks which distributors are carrying are generally limited,

and it is expected that the market will liven up materially when the trade begins to place business for its spring requirements. The statistical position of the market here is favorable; holdings are not excessive, and are generally controlled by strong interests. Added to the reported light holdings of distributors, and taken in conjunction with anticipated curtailed fishing operations during the 1924 season, and the market appears strong.

Labor Troubles—A report from San Francisco this week says that some of the vessels of the cannery fleet have sailed, carrying non-union crews. Last year the fishermen were paid 7½ cents per fish, and the cannery operators this year offered them 7 cents per fish. The union demanded 8½ cents, and the two interests were unable to get together. It is understood that some of the labor was brought from the East. The companies affected are the Alaska Packers Association, the Red Salmon Packing Company, the Bristol Bay Packing Company, the Nahnek Packing Company and the Alaska Salmon Company.

Future Trading—There is some interest being shown in s. a. p. offerings of salmon from the 1924 pack, but the larger operators are not yet inclined to name any firm price at which they will be willing to accept business.

Northwestern Fruits—More interest is being shown in offerings of new pack canned fruits, and business is gaining. One packer is offering new pack pears, f. o. b. steamer, Seattle, at $3.00 for fancy, $2.75 for choice, $2.45 for standards, $2.25 for seconds and $2.10 for waters, all in No. 2½ tins. Spot stocks of Washington canned fruits are exceedingly limited, and the prices quoted by various packers show considerable variance, depending mainly upon the quantities which the packers have to offer. Some of the packers with only light stocks in their carryover are quoting special prices in order to clear their warehouses and make room for the 1924 pack which will soon be coming in.

Export Outlook—Members of the trade here are greatly interested in President Coolidge's proposal to aid in the rehabilitation of Europe by extending American capital to help in the reconstruction. It is felt that if any loans made by this country, a large part will be immediately invested in foodstuffs for shipment abroad, which will provide a steady outlet for American food products, particularly the products of the Pacific Coast and the Northwest. Demand has been below normal for some time, the spirited dried fruit buying of February and March being the chief export feature for more than a year past. Salmon canners could use more export business, particularly on low grade stuff, which is generally bought by foreign markets.

MAINE MARKET

Maine Canned Foods Market in Healthy Condition—No Spots to Be Had—Future Corn Sold Up—Stringless Beans Well Sold—This Article Creating Big Demand.

Portland, Me., April 25, 1924.

By "Maine,"
Special Correspondent "The Canning Trade."

THERE have been no new developments in local canned foods circles during the past week. The late opening of spring is retarding the work of completing acreage contracts, and until that is done it is practically impossible to offer more futures.

Spot Goods are cleaned up so well that there are no quotations current. Crosby corn is worth $1.80 or better for fancy grade, and the last deals reported on Golden Bantam carried a price of $2.10. Apple is having some demand, without stocks on hand to fill orders. Blueberries are cleaned up entirely. In fact, all lines of Maine canned food products are in healthy condition, no goods on hand and the market fairly active in demand.

Future Corn is well sold up, and it is doubtful if any more is offered on the open market until June or later; and unless we have very propitious weather up to that time, it will not be possible to increase present sales to any extent. Crosby corn has held at $1.45, with Golden Bantam at $1.70. The yellow corn has had a very heavy demand, but it will never replace the old stand-by of early Crosby, as is shown by the fact that Crosby corn is now wanted for spot stocks, while Golden Bantam is not so acutely needed.

Stringless Beans have also sold well and quickly, and there are no offerings at this time. It is interesting to note that these beans, so lately known only to New England and New York trade, are now going to Florida, Texas, California and all intermediate markets. Canners are endeavoring to increase their bean acreage materially in order to take care of the increasing demand for the goods, and have made some gain this season. However, at the present cost of materials the selling price of $1.30 does not encourage them to pack these beans for speculation, and it will be many years no doubt before the up-put is beyond actual future contracts.

Notes—E. S. Noyes Co., of Augusta, will can apple sauce this season at their new Livermore factory.

Heart of Maine Packing Co. will again pack a limited amount of Refugee Beans to go along with their Stringless Beans, on which they already have a large trade. These Maine-grown Refugees are proving very satisfactory indeed, but the canners state they are handicapped by lack of acreage.

W. A. Howe, of the Continental Can Co., is in Maine this week, and will remain here the greater part of the time from now until the close of the canning season.

What The Brokers Say.

Milwaukee, Wis., April 19, 1924.

In most sections of Southern Wisconsin pea growers are preparing the land for planting—in many localities growers have already started seeding. Just two short months and canning factories will be operating.

The few canners who are still taking on future business will probably withdraw from the market very shortly, as bookings have been quite heavy the past week. We can secure confirmation on well assorted orders for future peas now, but we won't promise to secure confirmation next week or thereafter.

FRANK A. INBUSCH CO.

Wausau, Wis., April 19, 1924.

Anyone who tells you he is doing anything on Wisconsin canned foods is talking through his hat. There is simply nothing stirring. We have experienced nothing like this since the market blew up in the fall of 1920. However, the conditions are altogether different now. There is plenty of inquiry on spot peas, but practically no spot peas left. Canners are sold up on futures, and naturally the buyer has covered his requirements. Therefore, nothing doing.

The canner is busy getting started on his season's operations. Soil and weather conditions are all to the good. The last of the snow went off during the past week. We have had heavy state-wide rains, and the soil is working up in excellent shape. Down-state canners got their first seed in the ground a week ago. Everything seems to indicate that seeding will be going full swing next week. Increase in acreage is limited by the seed available. It hardly seems possible to increase it in excess of the normal increase in consumption.

GROCERS SUPPLY COMPANY.

NORWEGIAN EXPORT OF CANNED GOODS IN 1923.

DURING 1923 approximately 21.25 million kilos of canned goods were exported, and it is stated that this figure would have been greater had it not been for a shortage of supplies due to the failure of the bristling fisheries.

During 1921 there were exported about 15.5 million kilos of canned foods, and in 1920 about 19 millions. The canning industry of Norway represents considerable capital. In 1923 more than two-thirds of the exports were credited to Stavanger, and Bergen, which formerly held second place, was passed by Trondhjem, which contributed 2.2 million kilos to the export, followed by Bergen with about 2.1 million kilos. Haugesund exported approximately 500,000 kilos of canned goods, and the next greatest exporting ports were Kopervik, Bod, Aalesund and Christiania, in the order named.

HIS ONLY DRAWBACK

The boss was dictating to the new, pretty and sophisticated stenographer. Suddenly he stopped.

"Am I too fast for you?" he asked, anxiously. She considered him and then replied:

"Oh, no, indeed, but you're a trifle old."

What Canned Foods Distributors are Doing

Trade's Spotlight on Washington As Packers Seek to Have Consent Decree Voided—Wholesale Grocers Believe Packers Seek to Reenter Grocery Jobbing Field—Discount Government Suit Against California and National Wholesale Grocers' Association—Notes of The Trade.

Interest in the supposed attempt by Swift & Co. and Armour & Co. to re-enter the wholesale grocery business, through the setting aside of the Consent Decree of 1920 has supplanted, for the time being at least, that in the conventions of the two great wholesale grocers' organizations which are to be held within the next month.

Both the National and American Wholesale Grocers' Associations are planning to take up the fight against the Chicago meat packers where they left off after securing the supposed victory in 1920, when the Decree was entered into. Counsel representing these two organizations will appear in opposition to the packers at future hearings.

While it is thought that many canners would like to see the Chicago packers back in the market as canned foods buyers, the only canning organization openely interested in the fight is the California Co-Operative Canneries, believed to be a subsidiary of Armour & Co., which is seeking to have the decree set aside so that it may sell its canned foods products to the packers.

J. H. McLaurin, president of the American Wholesale Grocers' Association, commenting on the latest move of the two packers, with particular reference to Armour & Co., says: "Armor & Co. are not out of the wholesale business—at least, we have no evidence of it. This consent decree was entered into with the United States government four years ago. According to this provision it became effective three years ago, and since February 27, 1921, Armour & Co. have fought for it, offering as their reasons for these repeated requests for extension that they had some food factories which they were unable to sell, and to enforce the decree would be equivalent to confiscation of their property by the government. In the meantime, bear in mind that these packers have relentlessly waged a fight to have Section 5 of the Decree set aside and declared null and void, and we have that fight still in the courts in the name of the California Co-operative Canneries.

"We are not so blind that we cannot see what we believe is the purpose of Armour & Co. to keep their selling organizations alive through these repeated extensions of time, while at the same time we have the 'California Co-operative Canneries' girding themselves through court proceedings to set aside the decree. Just compare these two activities and we have a very clear picture, we think, of Armour & Co.'s plans. They may succeed in carrying out these well laid plans, but we again remind you that we are prepared to carry these issues before the Supreme Court of the United States if Armour & Co. make this necessary."

William C Breed, of Breel, Abbott & Morgan, counsel for the National Wholesale Grocers' Association, sums up that organization's attitude on the question as follows: "I am very glad that these two packers have now come out into the open. From the time that the California Co-operative Canneries started their fight to set aside this decree, commencing shortly after the decree was entered into, first in Congress and later before the Attorney General and then in the Supreme Court of the District of Columbia, it has always been assumed that the fight was being made by Armour, who had a mortgage on this cannery and has been otherwise closely connected with its affairs, although this has never been officially admitted by Armour. The filing of a brief by Armour and Swift, who have been the real parties behind the endeavor to modify this decree, will certainly help to clarify the situation in the minds of the public. I am glad that the fight will henceforth be in the open."

M. L. Toulme, secretary of the National Wholesale Grocers' Association, adds: "This association believes that the challenge made by the Armour and Swift defendants as to the validity of the decree is not well founded, and that the decree will be upheld and the National will continue as in the past to bend every effort to sustain the decree which was entered in the interest of the public and for the perpetuation of free competition in the food industry."

The appeal of Armour and Swift will be heard before the Court of Appeals of the District of Columbia on April 28th or 29th.

The Government's Complaint—Little concern is being shown by the California Wholesale Grocers' Association or the National Wholesale Grocers Association over the complaint which the Department of Justice has filed against them, and some of their members, for alleged restraint of trade in California.

Specific details of the complaint are not yet available, but it is believed that the charges are an outgrowth of the silent campaign which has been waged between chain stores and wholesale grocers on the Pacific Coast over the question of direct selling by the manufacturers to the Pacific chains. Both the chain stores and the wholesale grocers have had the moral support of their respective national associations, and quite likely pressure has been brought to bear upon manufacturers by both interests.

Among jobbers, however, it is though that the complaint was a parting shot by Harry Daugherty, retired Attorney General, who incurred the enmity of wholesale grocers as a result of what they considered his partiality towards the meat packers in the consent decree case.

It has just become known that John B. Newman, field man for the National Wholesale Grocers' Association, is named as one of the defendants in the Government's suit. Mr. Newman, a pure food authority of note, is one of the most popular men in the wholesale grocery trade, and attends to the contract work of the National with wholesale grocers.

Convention Party—C. W. Linthicum, secretary of the Arkansas Wholesale Grocers' Association has arranged for a special car over the Missouri Pacific for Arkansas grocers who will attend the convention of the American Wholesale Grocers' Association in Dallas. The special will leave Little Rock at 7:25 P. M., May 12.

Spoiled Canned Foods—Ross P. Seaton, secretary of the Illinois Wholesale Grocers' Association, announces that the Southwestern Region Office of the Division Freight Agent of the Pennsylvania System has called to the attention of all Pennsylvania freight agents the fact that under the Illinois Department of Agriculture ruling spoiled canned foods may not be shipped in interstate commerce.

Praise for the Jobbers—The California Walnut Growers' Association, in its initial trade bulletin for this season, says: "The remarkable distributing service which our wholesale trade rendered us this past season proves absolutely that close and cordial relations between a national distributor and its wholesale trade make possible a profitable distribution that in no other way can be approached in volume. This association's policy in the past has been to open prices at figures which inspired trade confidence in the market and tended to insure reasonable profits to both wholesalers and retailers for the service rendered. The most satisfactory selling results which our trade have persistently shown us speak loudly of their appreciation of such a policy. Needless to say this association will strive even harder in the future to retain this fine trade sentiment which we consider by far our greatest asset."

Notes of the Distributing Trade—The Aunt Jemima Mills Company announce that effective June 1st, 1924, their cash discount for payment in ten days will be 2 per cent. on package goods.

The Rich Bros. have regained control of the Purity Oats Company. The two brothers, who originated the product of the company, lost control last September. The Rotary Club of Keokuk, Iowa, raised more than $225,000 to put the Rich Brothers back in control of the company.

The Canadian Wholesale Grocers' Association will hold its annual convention June 21-24 at the Bigwin Inn, Muskota, Ontario.

The Clark Grocery Company has bought out the stock of the Fullbright Wholesale Grocery Company, of Fayettesville, Ark. The Fullbright concern is retiring from business.

Krasne Brothers, New York City, wholesale grocers, will remove their buying office from 122 East 130th Street to 1399 5th Avenue on June 1.

SMILE AWHILE

LEAP YEAR STUFF

"Don't you think it just wonderful to be engaged?" she asked.

"I suppose it is," I replied, "but I've never tried it."

"Have you heard about Dick and Vivian?" she went on.

"No; what about them?"

"They're engaged!"

"Oh!"

"Don't you ever dream of marrying?" she breathed, leaning closer and laying her soft white hand upon mine. "Think of a little cottage, a wife, and kiddies. . . ."

"Will you—would you—m-marry m-m-me?" I stammered.

"Oh, John!" she exclaimed in surprise, "this is so sudden!"—New York Mercury.

A QUESTION IN ECONOMICS

"I'm looking for a bright little boy," said the kind old lady to the youngster on roller skates, "who wants to earn a penny by mailing this letted for me."

"A penny, huh!" snorted the child. "Wot you're lookin' fer is a little dumb-bell!"

HEREDITY

"And why," asked the judge sternly, "are you a bootlegger?"

"Instinct, your honor," answered the prisoner. "My father was an undertaker and my mother threw acid in another lady's face.

WELL POSTED

Relative—My boy, I thought you were going to get married?

Ex-Collegiate—Girl threw me over.

"Why so?"

"Din't get my degree."

"But I thought you always made passing grades."

"The prof. that busted me claims I didn't do enough work."

"But how could he know?"

"Hell! He's the girl's old man."—Virginia Reel.

LONG DISTANCE, PLEASE

"Are you sure these field glasses are high power?" asked the lady potential customer.

"Madame," replied the ambitious salesman, "when you use these glasses anything less than ten miles away looks like it's behind you.

FAVORITE SAYINGS

The flivver owner: "Wouldn't that jar you?"
The radio orator: "I'll tell the world."
The murderer: "Well, I'll be hanged!"
The judge: "Fine."
The flapper: "No one has anything on me."
The telephone girl: "I got your number."
The sausage maker: "Dog gone."
The fisherman: "I'll drop a line."
The author: "All write."
The seamstress: "Darn it!"
The hydro-electric engineer: "Dam it!"

ONE POINT OF VIEW

"Are the many automobiles in your town a factor towards its prosperity?"

"Bet your life they are!" cried the enthusiastic building contractor. "They've enabled me to put two big additions on the hospital.

REVENGE

George: "How's the girl, Harry?"
Harry: "It's all off. I threw her over yesterday."
'Why?"
"I heard she eloped with another fellow."

THE LOOSER

"Try a sample of the stuff before you buy it," hissed the bootlegger.

"But suppose it kills me?"

"Well, it's my loss then, ain't it?"—Johns Hopkins Black and Blue Jay.

EDITORIALS

MEETINGS—The spring meetings of canners are now on in full force, as you will notice. Here we give you as much as we can squeeze into the issue of the big Western Canners' meeting, and of the sectional meetings of the National Canners Association, and if you do not find this sufficient have a little patience, and we will give you more next week.

We have yet to report the splendid meeting of the Canned Goods Exchange with its scintillating addresses which you will read with profit and pleasure. "Court Reporters" can't be hurried.

As we write the Indiana canners are assembled in their spring meeting at the Claypool Hotel, Indianapolis, Friday and Saturday of this week. The program has just come to hand, and it is attractive, filled from beginning to end with addresses which should prove interesting and instructive. John Souder, the President of this aggressive organization, is a live-wire, and he means that the tomato canners of his State shall understand the situation as it is, and not as they hope it to be. We hope every canner in that State is present to learn.

TOMATO PRICES—On Thursday next, May 8th, the Tri-State Canners will assemble at the Hotel Dupont, Wilmington, Del., in a session for members only. They promise it will be a business session, and it ought to be. We hope one matter they will take up and definitely answer for the peace and quiet of the whole country is why Tri-State tomato canners are so philanthropic, so big-hearted, so generous, as is evidenced by their willingness, not to say eagerness, to contract for future tomatoes lower than any other set of canners in the business, and lower than their expected costs. The answer to this question has puzzled the "oldest inhabitant" in the canning game. You know in the olden days No. 3 tomatoes used to hang around 60c to 85c per dozen, until Willard Rouse crowned himself Tomato King, and then No. 3 standards advanced to $1.60 per dozen—June 27, 1902—and stayed there until the next packing season brought them down. And you may take our word for it they came down! In the closing days of July or the first of August tomatoes began to come into market that year, and of course the canners grabbed them like hungry fish. We do not remember what they paid for them, but you can imagine, with canned tomatoes cleaned off the market, fresh tomatoes brought a price. At any rate, before most people knew that tomatoes were ripening, William Fait, a prominent canner of that time, was out with new packed, 1902 packed, tomatoes at 90c. In one cut, without any apparent reason, from $1.60 to 90c. The writer couldn't believe it, but he found it so. Then he went down to see Mr. Fait, and asked him, in a very direct way, why he had cut the market from $1.60 to 90c, when a 5c cut would have sold more goods than he could possibly have packed, and Mr. Fait answered, characteristically, "None of your damned business." That is just one sample of the answer to this question, and from that it has ranged from "because we love the public so," "because if I hadn't sold them he (another canner) would have," "I guess we know our business," "the cost figurers are all liars and we are not going to hold the bag," and so on up to "they are just plain, ordinary damphools;" and so, of course, we are just a trifle puzzled and would like to know the true answer. For even the buyers are beginning to wonder. They have bought some future tomatoes, and they are always satisfied if the future prices do not drop below those at which they have bought. Now their early purchases are beginning to look bad to them because of these continually lowering tomato prices, and of course they want to know. So this Tri-State meeting has to answer to the buying public, and we trust it will, and in a most emphatic manner.

IS SALMON TO FOLLOW OYSTERS AND SARDINES?—If you could see a celluloid cat walking a sulphur tight-rope over Hell you would have a faint picture of the position of an editor of a canners' trade journal attempting to touch upon the conservation of any natural product now canned. The growers of field crops call loudly for the experts to come to their rescue and help save their crops from the pea aphis, for instance, or tomatoes from blight or root rot or what not; but let any man dare to lay finger upon the oyster supply, to protect and propagate it, and while the canners of oysters might be expected to welcome

such action and be ready to help it along, all know that they would not. Eberybody else knows that the Chesapeake Bay oyster supply has been dwindling, growing yearly more scarce, and is today almost entirely gone, but the oyster canner will tell you that there are plenty of oysters! The fault is with the demand! There are too many people want what are being caught! The sardine canners answer along the same line—the sardines are not running, that is all! And now it has come the turn of the salmon canners, for salmon is going the way of the buffalo, it would seem, or of the oysters in this region. We have heard something of the canners' side of the question in the proposed regulations of the salmon catching industry by the Government, but we do not pretend to understand all its details. However, we have a hunch that Secretary Hoover does, and he spoke rather sharply thus in the May 1st daily papers:

(By the Associated Press.)

Washington, April 30.—Those who have assailed Secretary Hoover's Alaskan fisheries policies were charged by him today with having directed a campaign of personal abuse against him with the real purpose of defeating legislation which would save the fisheries of the Northern territory from "continued exploitation."

In a formal statement the Secretary named Senator King, Democrat, Utah; Delegate Sutherland, of Alaska, and the Hearst newspapers as factors in the publicity campaign against him. He challenged them to say openly whether they favor or oppose the fisheries "conservation bill" now pending in Congresss.

Delegate Sutherland repeatedly has attacked Mr. Hoover for his administration of the Alaskan fisheries, and Senator King sought last week to introduce a resolution for an investigation, but later withdrew it.

"The test of the character of the renewed attacks today upon the Alaskan salmon fisheries conservation is very simple and very direct," said Mr. Hoover's statement. "Do these gentlemen favor the conservation bill reported unanimously out of the House Committee on Merchant Marine and Fisheries after weeks of investigation, and reported unanimously out of the Senate Committee on Commerce after personal investigation on the ground by members of that committee?

Here are 16 Senators and 22 Congressmen on these committees of both parties, unanimously agreed on a measure for the saving of the fisheries. . . . Unless such legislation is passed the greatest salmon fisheries in the world will be lost to the American people.

"One of the features of this bill is to prevent monopolies and special privileges in the fisheries. The department is on record as having protested on frequent occasions against any growth of such monopolies or privileges. This measure is backed by all of the important bodies in the United States interested in conservation—it is opposed around Washington today by some groups of canners and some groups of fishermen.

"This publicity campaign can have no other purpose than to aid in the defeat of the bill, for there has not been a word in these statements favoring the measure itself.

"In these days of credulity the smooth and artful way to destroy legislation that interferes with some people's private interests is—not to oppose the measure on merit, but to slander the men who have the responsibility of protecting interests. If these men are against the bill let them say so, and give reasons why they do not approve of it. Let the public have argument based upon the merit of the measure itself."

PLAIN SPEECH ON THE LABEL—Mr. C. S. McGillivray is in charge of the Canadian canned foods division of the pure food law, and he has been able to solve the label question there in a way that attracts the attention of canners in this country. He spoke before the Western Canners Convention last week, and we urge a careful reading of his remarks. Among other things, he said a very large proportion of the consuming public still regard canned foods with doubt, and still show the old prejudice against them.

"The best way to overcome this prejudice," he said, "is to send a special messenger to the buying public with a message of truth about the products which you are manufacturing. And to my mind the best messenger you can select to carry that message is the one which accompanies every package which leaves your warehouses—the label."

Cut that out and paste it up over your desk, where you will never cease to see it, and then set to work to fulfil the prescription; make your labels say something about the goods you are canning; make them tell the whole story in simple truth and plainness. If that truth ever sinks into your consciousness your present labels will become a nightmare to you. Yes, a handsome label in five colors and gold, embossed! As old Aesop once said:

"Quanta species, cerebrem non habes."

Which, translated, means "what a beautiful face, but there is no sense in it."

We may not reach his splendid address in this issue, but remember it and study it, that you may know better how to make use of this best billboard in existence.

Western Canners Association Convenes

N. C. A. Sections, Corn, Peas and Tomatoes also Meet—Business Every Minute

Sherman Hotel, Chicago April 22-23-24, 1924

TUESDAY MORNING SESSION.

April 22, 1924.

THE first session of the Fortieth Annual Convention of the Western Canners Association, April 22-24, 1924, at the Sherman Hotel, Chicago, was called to order at 10.30 by President J. W. Hill, of Des Moines, Iowa.

Rev. John A. Lee, Chicago, made the invocation.

President Hill then introduced Wm. E. Dever, the famous Mayor of Chicago, who spoke upon the proposed canal from the Lakes to the Gulf, and what it would mean to the entire Central West. The Mayor extended a hearty welcome, saying, among other things:

In extending to you, in accordance with ancient custom, the keys of the city, I don't want to feel that every place in the city is locked up and can't be opened by some sort of a key. That is not true. Every place is open in Chicago that ought to be open in Chicago, that ought to be open in any city. Nothing has been closed in Chicago but those things that ought to be closed.

At any event, whatever is here you are entirely welcome to. We hope you have a pleasant stay here, and if there is anything we can do in the City Hall to make your trip here more pleasurable, more entertaining, more profitable, I hope you will call upon us. (Applause).

PRESIDENT HILL: The next thing on the program as provided by our Secretary is the address of the President. I might state for your relief and benefit that the President does not desire and does not intend to deliver any address whatever at this time.

I am inclined to think that I voice the opinion of most of you when I say that in my judgment and in that of my friends from the western side of the Mississippi River we feel there is a brighter era approaching the canning fraternity. Our sales throughout our section of the country, and indeed I think over the entire territory of the Western Canners Association, have been almost one hundred per cent more than a year ago at this time The organization with which I am in closest contact sold more goods up to the first day of April than they had up to the middle of August a year ago. These, of course, as you understand, are sold at somewhat advanced price over that of the previous year. Money, which is a very necessary article in the canning business, is, we think, easier, and the outlook as a whole is brighter, so that we feel very much encouraged,

We will now be addressed by Mr. Sol Westerfeld, of Chicago, on the subject "The National Association of Retail Grocers of the United States." (Applause.)

Greetings from the Retailers.

MR. SOL WESTERFELD: Mr. President, and Members of the Western Canners Association: As the representative of President Philip A. DePuyt, who, owing to another engagement, is prevented from being here, it is my honor and pleasure to bring you greetings from an organization whose interests parallel those of your organization.

How fully the President of my organization understands the import of the work you are engaged in, and the desirability of our sharing in it, may be readily observed from an extract of a letter received by me in answer to my question, what message he desired me to bring to you.

These are his own words, in his usual direct and forceful language:

> "Regarding message to Western Canners, it seems to me that the central thought of all association work is the promotion of good will between all of the factors in the food industry and the promotion of a spirit of fair play. Recognizing that each of these factors have their own perplexing problems which are peculiar to their own industry, we nevertheless feel that much can be accomplished through associated effort.
>
> "What we need is a more sympathetic understanding and belief that the other fellow is trying to play the game straight and to encourage this attitude."

In conclusion, permit me to thank you for the opportunity to appear upon your platform, an opportunity I enjoyed the more on account of my lifelong friendship with your Secretary, that grand old man and canned foods expert, my good friend John A. Lee. John and I have fought, bled and died together in many battles, always side by side, never in opposing ranks.

May I be permited to further co-operate with you, my good friend John, and my organization with yours? (Applause.)

PRESIDENT HILL: We are very glad to have this encouraging message from our friends, the Retail Grocers. Of course, if it were not for that organization, the business of the canners would be nil. We are very glad to have you with us.

We will now have an address by Mr. Humphrey, representing the American Wholesale Grocers Association. Is Mr. Humphrey here?

SECRETARY LEE: Mr. Humphrey will not be here. He was unfortunately detained. I have a telegram from him.

"Western Canners Association, Chicago:

> "Business matters over which I have no control force me at the last moment to advise you of my inability to be with you. I cannot express in this message my disappointment, for I long to tell each member personally of my kind feeling for your Association and to assure you and each one of your members that every wholesale grocer belonging to the American Wholesale Grocers Association joins me commending your Association for the square and manly co-operation given our conference committee in perfecting a contract. It stands four-square for both parties concerned, and we pledge you our support in completing a nationally satisfactory swell allowance.
>
> E. A. HUMPHREY,
>
> Conference Committee, American Wholesale Grocers."

PRESIDENT HILL: I will ask the Secretary to kindly prepare a proper reply for this telegram.

The National Wholesale Grocers Association is represented by Arthur P. Williams, of New York City. (Applause.)

Greetings from National Wholesale Grocers.

MR. ARTHUR P. WILLIAMS: Mr. President and Gentlemen: The National Wholesale Grocers Association wish to extend to you their greetings. We wish to thank the members of your organization who assisted us in the difficult settlement of the famous swell problem. Many of our members were with us during those long sessions, particularly at the last session, where we started at half-past nine in the morning and adjourned at a quarter past twelve at night, finally coming to an agreement which I believe is going to prove of great benefit to all of us, particularly in those markets where we have been unable to even handle swells. I think that that setlement has already during this spring tended toward an increase in canned foods business. Certainly we have never had such a good business as we have had this spring. we have never had such large sales, nor have we ever had such a clean-up and such a satisfactory market.

Our President, Mr. Herscher, was with us yesterday, but had to go home last night. He left me to extend the greetings of our Association. He asked me to call to your attention a resolution that we passed in conformity with a resolution of the New York Canners Association, recommending for the purpose of standardization the abandonment of the No. 3 can after January 1, 1925. We followed the resolution of the New York Canners Association on that subject. it being, in my opinion, a standardization on No. 2½ throughout, instead of having No. 2½ and No. 3.

I wish to also assure you. gentlemen, that the Wholesale Grocers Association is heartily in accord with the policy of pushing and selling future canned foods, that we are doing everything in our power to push future sales, to pass the distribution equitably from canner to jobber and on to retailer. We believe it is an economical policy, a proper policy of business, to push the sale of canned foods on future contracts, and we are doing everything we can along that line. We assure you we will cooperate to continue that policy.

Just one other point, not in the spirit of scolding at all, is the question of quality. Last year there were from fifteen to eighteen million cases of peas sold. You know as well as I do that the sale was due to the quality of the 1923 pack of canned peas. That quality should be maintained. It should be main-

tained by every power that you have, by every method that you can adopt to stop the man who wants to pack poor stuff. Every time he packs poor peas he hurts you and he doesn't benefit himself. The quality sold the goods. The quality again will sell another pack, and if the quality is maintained such as it was in 1923, you gentlemen can sell 25,000,000 cases, in my humble opinion.

Welcomes the Brokers.

PRESIDENT HILL: It was a very happy thought of the Program Committee in inviting representatives of the other organizations with which we do business to be present and present these very encouraging words that we have heard thus far.

Now we come to the boys who are in closest touch with the canners themselves, the brokers. We will now be addressed by Mr. Whiteman, President of the National Food Brokers Association. Mr. Whiteman hails from Oklahoma City. (Applause.)

MR. CHARLES P. WHITEMAN: The most economical and the best and quickest way for you to get a hearing or to get a standing with the buyer or distributor is through the broker. If you hook up with the right broker you have a standing and a prestige right off the bat that it would take you years and years to get if you were to go at it alone or in any other way, due to the standing and the prestige of that broker in that market through years of service and contact with the distributor. You would get a hearing right away. You would commence to do business all over the country, and in the course of two or three years, solely through your broker's efforts, you would have a well-established business.

There is the packer that will quote anybody that sends him a wire asking for a price. According to my way of thinking, this fellow is narrow between the eyes. This practice is not good business. Just as soon as you quote through more than one broker in a market (I am speaking generally; there may be some exceptions in markets like Chicago or New York, but outside of those two markets, or possibly three, what I am saying I absolutely believe to be true), you lower your standing in that market with every buyer in it. If you don't believe that, just leave home for a few weeks and go out and interview some of the buyers in these different markets. Furthermore, the brokers will not have near the interest in your connection for your account as they would if they knew they represented you exclusively and knew you would not quote anyone else in that market. I am proud to say that this practice has dwindled down to a minimum. It used to be very prevalent in years gone by, but it has gotten down to a place now where very, very few people do that.

Greetings from the Machinery Men.

PRESIDENT HILL: We have another class of men who are very close to use, and that class is the manufacturers of machinery and supplies. This matter will be presented by Mr. E. E. Finch, the President of their Association, of Cincinnati.

I might state that, through inadvertency, Mr. Finch's name was left off the regular printed program, but he should have been there, and we are very glad to have Mr. Finch with us, because he is a very important factor in the manufacture of canned foods. Mr. Finch. (Applause.)

MR. FINCH: I want to talk to you about corn and peas and beans and kraut and tomatoes. You know in this country there are 120,000,000 people—something over that. Dividing that into five to the famliy, we have 24,000,000 families. If those families were to consume one can of either corn or peas or beans or kraut or tomatoes per day, they would consume in a year 8,760,000,000 cans. Did you ever think about that?

Last year, in 1923 (in these five products that I have referred to) there were produced, according to the statistics as near as I could get them from the National Canners Association, 1,410,000,000 cans. They are only eating one can of your product about every five days. They ought to eat more than that. There ought to be a greater demand for canned foods.

I talked to a party of ladies one night at a little bridge club during canned foods week. It was just after the U. S. Printing Company, at Cincinnati, had had a broadcasting on canned foods. Those women said: "Why, we never knew canned foods were put up in such a nice, clean, sanitary manner."

One woman said: "I never ate a can of corn in my life because I thought they just took the corn and put it in and cooked it up with all the bugs and worms and everything else in it."

Those are the facts that you get from the people who consume your goods.

One of the complications of the canned foods proposition is your various grades. You know the average buyer of canned foods doesn't know a thing about standards and selects and extra fancies and grade 1, 2, 3, 4, 5. That doesn't mean anything to them. They don't know whether 5 is the best grade or No. 1. Neither do I. When I go into a store on Saturday to do some shopping, which I do every Saturday, I ask for a can of peas, and the clerk rattles off somethng like this: 22, 28, 34, 40c. I say, "I want a good grade."

"Well, the 40c grade is the best grade." So I buy the 40c grade and go home and probably I am happy.

Somebody else comes in and buys a cheaper grade, and maybe they are and maybe they are not happy.

Yesterday I attended a meeting of this advertising proposition over here, and they asked me to say something, and I did, and I talked about quality and the fact that last Monday night we had canned corn at our house and it was excellent, and Mrs. Finch went over and got some more of the same grade, and Friday night we had canned corn soup. She thought she had bought the same kind of corn, but it wasn't. They told me last night I shouldn't have said that, but I did, and I want to say it to you people who put up canned foods.

If you can get the real quality to the consumer then your advertising schemes are solved, you needn't worry about them. If you can get the good quality to the consumers, you can have them eating canned foods every day, and 8,000,000,000 cans per year is possible.

I believe that in the canning industry from the consumer and I want to tell you about it. But before I tell you that I want to offer this suggestion. I offered it to several people since I have been in Chicago who are either directly or indirectly interested in the canning industry. They tell me I am crazy; probably you will, but any way I am going to tell you. Assuming that I am right in the price of this can of peas, you sell a can of peas at 22c, and a can at 34c, and a can at 40c. You can raise that price 4c a can and sell it just the same. You can raise every can of product that you sell to the consumer 2c, 3c or 4c a can and sell it just the same.

When I advance that argument they tell me it can't be done. I ask them why, and they don't tell me why. They just say it can't be done. Why can't it be done? They raised the price of bread, and they are still selling it at a higher price. Why can't they do it with canned foods? Why can't you put 4c more on a can? Your retailer can make more money, your jobber will make more money, your broker is going to make more money, and that is what he wants; they tell you they have got to make more money, and your canner is going to make more money.

If you will put into your canned foods the one thought (and this is where your contact comes with the consumer) that every can of goods that goes out of your cannery you see in your mind's eye the consumer eating, you are going to put quality into it. It is not going to be canned corn soup, it is not going to have pieces of cob in it and pieces of husk and things of that sort that we sometimes find. You canners probably don't know it, probably you fellows don't do that sort of thing, but some of the fellows that are not here today do pack that sort of stuff. If you put the quality into it you are going to make that real close contact, and when you make up your mind that the goods that you pack are going to be the best goods that you can produce, that you are going to put into that all that you have got in effort and ability and energy and heart and soul and mind, let me tell you when you go out to sell it I dare any jobber to tell you what to sell your goods at. You are going to tell him what he is going to pay, and you are going to get it, and you are going to put your own label on the can, and you are going to put your own distinctive mark or brand on that can, so that the people are going to be pleased and happy about it.

I want just to give you this illustration. I went into three little stores in the vicinity of our factory the other day. We are in a poor section of the city. One of these was a small chain store. I said, "What brands of vinegar do you sell?"

"Two brands, a local one made in Cincinnati and another one nationally advertised."

I asked him what per cent of the nationally advertised one he sold, and he said 60 per cent. I went into a large chain store near this fellow and he told me he sold 90 per cent. I went into a little dump where they had a few little groceries and probably a bootlegging place in the back (although I am not familiar with it) and they told me that they occasionally sold a 5c bottle of vinegar.

Out on the Pacific Coast there is a manufacturer of preserves and jams and jellies, and when you talk about quality, jams and jellies are much the worst thing on the market I know of today, and they are in bad shape. Out on the Pacific Coast this manufacturer of jams and jellies turns out a good quality. He started in a small way. He sells his jams and jellies and preserves all over the Pacific Coast, all over the United States, and sells more of them in New York City than any other manufacturer of jams and jellies and preserves in this country.

I don't want you to think that I think the canners pack poor quality, because I don't think they do. You all pack good quality, but in my opinion the trouble is you don't pack all good quality. I hope you won't tell me that what I have said to you is

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

visionary, because it isn't, it is thoroughly practical, it has been proved over and over again.

This brings me now to the point of advertising, which has been under very serious consideration, and I know you are all going to advertise. The first thing to do if you are going to advertise successfully is to improve the quality of your product, and then it is going to be easy. If you are going to advertise, in my humble opinion, you will advertise in groups. Your pea packers will advertise their product and the corn people will advertise their product and if you do that you are going to have a very great success. It is going to be possible to increase the sale of your tremendously. Your kraut friends have shown it to you and they have only scratched the surface, they are just getting started and they have already demonstrated the success of it.

I would like to give you two illustrations that have happened to come under my observation the past six months. I know a manufacturer who put a product on the market for which there was no established demand. He had a average sale of about $300 a month. He started a national advertising campaign and in three months he was selling over $100,000 a month. After about seven months it dropped in six weeks to absolutely nothing because the product that he was trying to sell had absolutely no merit behind it.

I know another product that was started five years ago and they did a business of $200 or $300 a month. They started their advertising campaign, and in the first nine months of 1923 they spent $333,000 in advertising. Today they are running on an average monthly sale of 3125,000 a month. The business is stable, it s going along at the rate. That is what they have done in advertising.

I just want to close these rather rambling remarks by telling you that our Association likes you; collectively we love you, and if there is anything in the world that we can do for you, you have but to ask it and we will endeavor to serve you.

PRESIDENT HILL: 1924 profits in the lights of 1923 performance, we will now have the pleasurer of listening to Mr. Albert T. Bacon, certified public accountant of this city.

MR. ALBERT T. BACON: When we speak of 1923 performance we are speaking of facts, and when we speak of 1924 profits we are speaking of hopes mingled with fears, perhaps.

I would like to give you now a brief memorandum of the makeup of these figures that you have and where they came from. Our survey covered fourteen plants that packed peas only, these happening to be in the state of Wisconsin, nine plants that packed peas and some one or more other commodities. We shall refer to these plants as packers of diversified products and packers of peas only. Each class appears on each of the statements. Of the nine packers of diversified products, three are in Wisconsin, five in Illinois, and one in Minnesota.

In arriving at the figures on corn results, we selected four plants that packed corn only, one located in Iowa, and three in Illinois. Thirteen packing plants packed corn and some other product or products, two in Wisconsin and nine in Illinois, others in Iowa and Minnesota. One of the assumptions that the average layman would make is that a plant packing diversified products, that is more than one commodity in the same plant, should have a lower unit cost than one that packs a single commodity in the plants. The conclusions we arrived at in compiling the corn data bear out this assumption. The conclusion that we arrived at as to corn only bears out this assumption.

If you look at that corn sheet you see corn in the first column is one dollar six and a half cents per dozen, and a cost 98.3 cents to pack corn in plants where some other commodity or commodities were packed.

This situation is exactly reversed by the pea packers in that canners packing peas only had a total average cost of one dollar and twenty-four cents per dozen as against a total cost in the diversified line of one dollar and twenty-nine cents, nearly one dollar and thirty cents.

We shall now attempt to say why these differences should be. First, as previously stated, the fourteen plants that packed peas only were all located in Wisconsin and as a rule were small plants generally erected in the pre-war period and, therefore, erected at low cost. Most of these packers secure their labor from their own locality and so have lower labor costs than the average larger plants that pack diversified products. Others import laobr and are at a marked disadvantage in that regard.

The average paid for green produce was 9.3 cents a dozen less than what was paid by diversified packers.

This difference is largely accounted for because of a proportionately shorter pack of diversified packers and partly because the diversified packers produce a larger percentage of fancy goods, as is brought out by the average sale prices which

are one dollar and forty cents for the single commodity and one dollar fifty-two and a half cents for those who packed more than one commodity.

The direct cost of single commodity packers is eighty-four cents against ninety-four cents for diversified.

I will let you follow through with this as a basis. If you will study carefully the third column, the increase and decrease between these two kinds of plants, I think you will find a commentary on your own situation and perhaps a way out for yourself in the way of adding to your line or of accepting the sum total of results of various packers. You surely can get some information to help you in your own plant from these experiences.

I can only repeat what I have heard in attending conventions for the last fifteen years or more, that it pays to pack quality. I have heard "pack quality" until I know it by heart.

The average profit per dozen of all pea packers was 19.4 cents, and the average profit per dozen for corn was only nine cents. In other words, the pea packers made more than twice as much per dozen as the corn packers. This, however, should be taken into consideration with this fact, that as one of our clients has expressed it, if you make anything on canning peas you generally make a lot of money, and if you lose you usually lose a lot of money. It is more hazardous, judging by the experience of canners, to pack peas than to pack corn.

Up to this point we have summed up the relationship of 1923 cost and sales values for the average of canners who pack peas only or corn only as against those who pack diversified products.

It might be interesting to know that the profit made by twenty-three pea packers was $589,000, and the profits made by seventeen corn packers was $408,000. That is the pea packers made an average of $25,500 per plant and the corn packers made only $24,000 per plant, but a further difference is noticed when we consider the number of cases packed, for the pea packers

The next phase of this discussion should probably be the cost of the 1924 pack. Some of you no doubt have prepared a budget wherein you entered the estimated cost of each item of the 1924 pack. Most of you no doubt have sold a good proportion of your pack for 1924 on future delivery and you have a very close idea of the quanity of each grade you expect to pack; therefore, you should have an approximate figure in your mind as to the 1924 product.

We have agreed that this figure is at this time merely a guess, perhaps it is two-thirds hops and one-third fear, perhaps it is a day dream, but ten months hence when the result of 1924 has been set down, it may be very different from your present expectations. We have some very good friends in the canning industry who set up a budget each year for the pack of the year to come and who sell a large part of their product on futures when their judgement indicates that that is the best policy. At the close of the year when the actual cocts and operating results are determined, they compare such results with their budget. Such a procedure is very good training for day dreamers because if the budget has not been set up on a sound basis, the figures themselves are a rebuke to those who prepared them.

I can't emphasize too strongly the fact that it is well to prepare a budget, it is well to forecast the future, but then compare it with what you have actually done for that period and see how far off you are or how close you are to the actual facts, some of which could have been foreseen and some if which are utterly unforeseen.

We have compared the general trend of prices at which the 1924 pack will be sold with the prices at which the 1923 pack ware sold and find that there is generally an average increase of a few cents per dozen for 1924 over 1923.

Now let us survery briefly the anticipated costs for 1924. The first item that strikes us is that the can costs will be higher. The cost for No. 2 cans will be a little more than 4c a dozen higher than 1923. It is impossible to say what the labor situation will be as this item seems to differ in each locality. However, for our purpose we will assume that there will be no change in the labor costs. The prices paid for green produce will be perhaps the same as 1923. The price for cartons will be lower than in 1923. If we assume that other items of cost will not vary greatly from 1923, the average profit for 1924 should closely approximate the profit for last year. Of course we must base that supposition on the success for 1924 in packing that is comparable with the 1923 grades packed and with the 1923 prices realized.

There was a short pack of yeas last season in many sections. The growers were late in planting because of the unusual wet cold spring. We understand that the 1923 pack has been cleaned out and the canned foods week campaign is becoming increasingly popular and has much to do with the moving of surplus stock

Export of canned foods is somewhat on the increase and that helps our consumption.

We can not paint quite such a rosy picture for the corn canners as we believe the 1923 corn pack was large and of good quality, especially in Illinois and Indiana. The corn in other sections was not so good and large. The spread between the average sale price of corn and the average cost of pack is not so great as the spread for peas. That is an important thing to consider.

As an accountant it is discouraging sometimes to find many business men both in the canning and other industries who pay little or no attention to costs. Some canners claim that they sell their goods on the basis of prevailing selling prices as established by the trade, generally having no regard absolutely for their costs. It is true that market conditions may influence one to meet competition, but we do not believe that it is good policy, no matter what a man manufacturers, not to compare his cost with his selling price and forecast both as far as he can so as to see that he is not going into the hole, for if he doesn't see to it he will lose.

As to packing standard goods as against fancy goods, we know of instances where canners have packed almost nothing but standard goods and have sold in accordance with market prices and they just take their losses year after year until there is nothing more to take. I find more and more among successful canners an increasing interest in finding or determining their costs. In my opinion the ideal canner is the man first with a practical knowledge of growing and canning the product, and then on top of that the man who is thoroughly cognizant of his costs and able to forecast them with almost uncanny accuracy. Men who have that combination are at the forefront of your industry, and the younger men who have that are fast coming to the front. (Applause)

PRESIDENT HILL: Mr. Virdin of Iowa, will act as Chairman of the Committee on the Secretary's report in the absence of Mr. Stare. Mr. Cosgrove of Minnesota and Mr. Mitchell of Illinois are the other members.

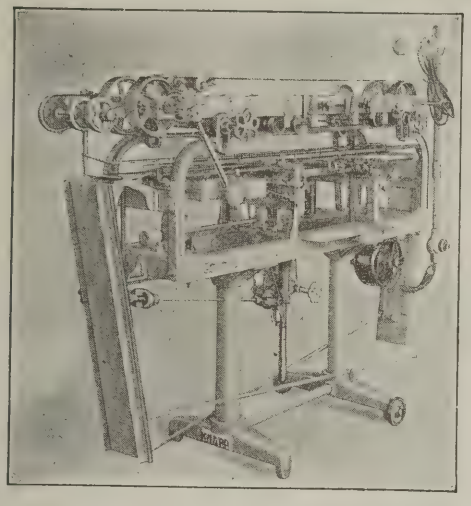
The meeting adjourned at twelve-thirty.

MEETING OF THE N. C. A. PEA SECTION

Tuesday Afternoon Session

April 22, 1924

The meeting was called to order at 2.15 by Mr. F. A. Stare, Columbus, Wisconsin.



CHAIRMAN STARE: At the Buffalo convention, the Pea Section ratified the definition on standards that had been prepared by a special committee who held what might be called a public hearing, as a result of which certain definitions were formulated. After the ratification at Buffalo the Department at Washington was not quite as well satisfied as Dr. Blank had thought it might be. Another conference was held and certain suggestions of changes were made.

The definitions adopted are not yet in effect, for the Committee who prepared them and the section which ratified them can only refer them to the General Standards Committe of the National Association; in other words, this committee has no power to do any more than it has done. They are not quite acceptable in their present form, and I believe this would be a good time to have the matter presented. I will, therefore, ask Mr. Charles Hunt, of Osewago, New York, to present the matter of standards.

MR. CHARLES HUNT: Mr. Chairman and Gentlemen: The Special Committee which was appointed a year ago at Milwaukee to take up this subject adopted the standards which were ratified at Buffalo, and then this Committe met with the Bureau of Chemistry at Washington on February 25th. Unfortunately the full committee could not be there, but here is the substance of what happened: the Committee at Washngton asked our Committee the following questions: "Can the Committee feel that the industry and the trade will support these standards if used as a basis for action for misbranding? That is, do these standards properly represent trade distinctions between the different grades?"

Of course, that is a very potent question, and it seemed as if it were a little unnecessary after all the work that we had done, but at the same time they wanted to make sure that these definitions as we had adopted them really represented what was an actual trade practice.

The next question was, "Are the definitions precise enough to be enforceable?" The use of such terms as 'reasonably' and 'practically' and basing the definition of one standard of quality

The NEW KNAPP LABELING MACHINE

The basic principles—the essential component parts of the New Knapp are the same as those used on the present machine.

The new features are the results of a quarter of a century experience growing out of suggestions offered by our many users, after consultation and careful development by our designers.

1. All metal frame -- enameled in gray
2. Increased capacity of labels
3. A simple fool proof motor drive adjusted automatically with carrier
4. Adjustments for sizes by simply turning hand wheel.
5. All adjustment made and controlled from operators side of machine.

on its comparative relation to a higher quality, was particularly referred to in this connection.

"(3) Should not some reference be made to split peas, discolored peas, or foreign matter in these definitions? In absence of such reference the Committee holds that such foreign matter is practically excluded.

"Another point which seemed to be very important in the eyes of the Committee was the fact that grading of peas is done before pre-cooking and that therefore statement of the size on the label may not inform the consumer correctly regarding the size of the peas in the can. Mr. Wolcott and Mr. Hemmingway tried to point out that it would be impracticable to grade peas after cooking and that variations in size were more apt to occur in the more mature, lower grades of peas where the question of size was relatively unmportant. It was generally agreed that it was better to have the proposed definitions of size established as given in the standards rather than to have no definitions at all; that from the standpoint of the consumer the question of quality was far more important than that of size."

The following minor suggestions were made for changes in the proposed standards:

"At the beginning of Paragraph 3, instead of 'canned pea varieties' substitute 'pea varieties used for canning'. In the following the word 'matured' should evidently be 'maturing'.

"In the four definitions of quality which follow, the words 'prepared from' should be inserted after the words 'peas are', in the first line of each definition.

"The term 'off quality peas' should be substituted for the term 'off grade peas' in definition of the lower qualities as the term 'grade' is used in all the succeeding paragraphs to indicate size."

Acting upon these suggestions the Committee has met and offers these definitions. We made the correction, "Varieties of Peas used for canning," as suggested by the Commttee. Other than that the wording is the same.

> "Canned Pea Qualities. Fancy Quality Canned Peas are prepared from fresh, young tender peas of practically uniform color and size, unless declared to be ungraded for size. They have a practically clear liquor and are free from flavor defects and practically free from skins and split peas."

The difference between that and the definition ratified at Buffalo is this, "Fancy Quality Peas are fresh, young, succulent peas of practically uniform color and size, unless declared to be ungraded for size, with reasonably clear liquor and are free from flavor defects".

You notice there was no mention of splits or skins in the definition adopted at Buffalo, and therefore it was covered in this revised definition.

> "Choice quality canned peas are prepared from fresh peas which may be less tender than those used for 'Fancy Quality' of reasonably uniform color and size, unless declared to be ungraded for size. They have a reasonably clear liquor, though not necessarily free from sediment and are reasonably free from flavor defects, skins, splits and discolored peas."

We have endeavored to cover these questions of skins and splits of discolored peas in these definitions as suggested.

> "Standard quality canned peas are prepared from fresh, though possibly more nearly matured peas. They may lack some unifority in color and size, may have a roily liquor and may have some skins, splits, or discolored peas.
>
> "Off-quality canned peas are prepared from fresh peas that look in other respects the qualifications of the higher qualities."

It seemed to your Committee that these definitions as they are now revised covered the trade practice that has been established for I don't know how many years as between the jobber and the packer. It seems to me that we can go before the Bureau of Chemistry now and say that these definitions, if they meet with their approval, do cover the ground they should and that they are enforceable.

However, there has been some comment made to the Committee on the use of the word "succulent" instead of the word "tender" in the definition of fancy peas. They thought that the word "tender" was a little more readily understood than the word "succulent".

"Succulent", if you look in the dictionary, refers to a juicy pea; a tender pea necessarily must be a juicy pea also. The government in one of their bulletins use the word "succulent" in one place and in another they use the word "tender". I don't know that it is material which word is used, but the Committee used the word "succulent" for the reason that it was found in their bulletin and we merely copied their usage.

In describing the size of the peas there has been no change in the regulations adopted in Buffalo. It is now a question of the adoption of these or such changes as you may care to make. That is up to the Section.

CHAIRMAN STARE: I think perhaps we should listen at this time to a few words on the Capper Bill so that the people in Washington may know whether the canners are in favor of the passage of the bill or whether they are not. I would like to have Dr. Woodbury, of the National Association, present this matter.

THE CAPPER SEED BILL

DR. WOODBURY: (National Canners Association, Washington, D. C.) The purpose of the act is twofold: first, to enable the Department of Agriculture to make a scientific study of varieties of vegetables, in order that the present chaos in variety names may be overcome and the grower of vegetables informed regarding the endless number of names for the same variety and the large number of varieties often under the same name, a condition which characterizes the seed industry at present and which affords unrivalled opportunity to the unscrupulous seedsman. It also makes difficult the progress in variety improvement for which the better seedsman and plant breeders are striving. Second, the proposed measure will enable the buyer who is especially interested in obtaining the highest quality of seed to buy such seed with some official assurance that the seed is as represented. This is provided through the federal registration of seed, and represents a type of legislation the principle of which, while comparatively new in this country, has been applied in the Scandinavian countries with notable success to the improvement of grains, sugar beets, and other seeds.

The Canners' Interest in Seed Legislation: The interest of the canning industry in seed legislation has its origin in the serious losses sustained by canners from use of seed untrue to name or lacking uniformity and trueness to type.

Losses From Seed Off-Type or Untrue to Name: An illustration of such losses is found in the experience of pea canners in 1920 when about one-third of the entire canning pea acreage in one of the important pea canning states was seeded with peas which were purchased as Alaskas but which proved to be spurious stock. The seed in this case contained mixtures of degenerate strains of Alaska and of a forage variety of pea having purple flowers. The degenerate Alaskas, or rogues, in this stock were characterized by very heavy growth of vines on which there were blossoms, very young peas, peas at canning stage, and peas too mature for canning, all at the same time. The true Alaska is characterized by a short vine growth and by the development to canning stage of practically the entire crop at the same time. The presence, therefore, of any considerable quantity of "rogues" lowers the yield of canning peas and produces a crop from which it is impossible to make a satisfactory pack of peas.

The purple blossomed forage peas included in the spurious Alaska stocks in 1920 bore peas which caused a dark, inky discoloration in the liquor on processing, making the pack entirely unfit for market. The presence of even a few of these peas in a can always results in the darkening of the liquor.

In the case of the spurious Alaska in 1920, the pack of one company alone was actually about 22,000 cases, whereas if the acreage grown had all been of true Alaska the total pack, based on the yield of a comparatively small acreage which was seeded to true Alaska from another source, would have been not less than 75,000 cases.

Another striking illustration of loss due to seed being untrue to name is found in the experience of tomato growers in Delaware in 1918. The tomatoes in this instance were not put out for canning but for marketing fresh. As the crop approached maturity it was found that over a large acreage the tomatoes were yellow instead of red. Their value for the fresh market was thus practically destroyed. The agricultural authorities of Delaware made a special effort to find a market for these tomatoes in order to save the growers from total loss. The government at that time was buying a large quantity of canned tomatoes for the army. The matter was taken up with the National Canners Association and canners offered to handle these yellow tomatoes practically at cost if the government would buy them. Cable inquiry to France brought the reply from United States army authorities there that the army would be unable to purchase yellow canned tomatoes because the soldiers would not eat them. The fact that these tomatoes

NO. 2-C AUTOMATIC BODY MACHINE WITH NOTCHING AND SOLDERING ATTACHMENT.

Our No. 2-C Bodymaker as shown with notching and side seam soldering attachments and automatic blank feed, has a capacity of 150 lock and lap seam sanitary can bodies per minute.

This entirely automatic high speed machine is adjustable for all sizes of sanitary cans up to No. 3 size. All adjustments are combined so as to maintain correct alignment of working parts when changing for sizes.

The construction of this machine is unusually heavy, weighing complete 9000 lbs. and the adoption of crank movements permits a high capacity and insures a smooth operation, free from vibration.

The combination friction and clutch is provided with control levers conveniently located and arranged so that the soldering attachment continues to operate, if the forming mechanism is momentarily stopped.

This is a strictly high speed machine complete, in every respect and embraces many unique features necessary to the requirements of a modern sanitary can making line. For further particulars apply to

McDONALD MACHINE CO.

7600 South Racine Avenue **Chicago, Illinois.**

were of a variety different from that for which they were purchased resulted in practically as great a loss to the growers as if the seed itself had failed to germinate.

Losses have likewise been experienced by canners of other vegetable crops, including sweet corn, green and wax beans, beets, spinach, etc. In the case of sweet corn, the loss may be due to low yield resulting from a poor quality of seed, or seed infected with plant disease organisms causing root, stalk and ear rots. With beans, losses are experienced due to lack of uniformity and trueness to type, presence of an undue amount of stringiness caused by poor selection of seed stocks, or use of seed infected by anthracnose and other seed-borne plant diseases. In the case of beets, losses are experienced through occurrence of type beets. If any considerable proprotion of the seed produces beets which are long instead of round, light red instead of dark red,, or beets which on being cut show alternate zones of dark red and white, the crop is practically unfit for canning.

Canners' Interest Same as Farmers, Because Canners Must Provide Seed: Canning crops are usually grown on contract. The farmers in the neighborhood grow a specfied acreage, the product of which is delivered when ready for canning to the local cannery at a price specified in the contract. In order to insure so far as possible a uniform raw product for packing and a proper succession of maturity of crops so that the canning season may be extended, it is customary for the canner to furnish seed to all his growers. The success of the canner and of every grower of canning crops depends equally on the quality of his seed, especially on those elements of quality having to do with types and trueness to name.

When the seed proves to be untrue to name or lacking in uniformity and trueness to type, the losses involved are serious indeed and must be considered from several standpoints, such as:

(a) Loss to the canner from low yields.

(b) Loss to the canner of good will of contracting farmers who, being disappointed in the unprofitable low yield, will in future refuse to grow canning crops.

(c) Loss to farmers themselves due to low yields.

(d) Loss to the consuming public of many thousands of cases of food which would have been produced from the acreage planted and which the factories were equipped to pack.

(e) Loss to canners through increased packing cost due to higher overhead because of unforseen small pack on account of low yield from poor seed.

The amounts paid by canners to growers of some of the principal vegetables crops in 1919 were as follows:

Corn	8,130,000
Peas	6,079,500
Tomatoes, including pulp and paste	13,025,900
Wax and Refugee Beans	2,464,000
Navy Beans	8,356,500
Lima Beans	370,000
Kidney Beans	476,200
Kraut	925,500
Pumpkin	92,000
Beets	204,000
Sweet Potatoes	799,700
Spinach	744,000
Hominy	135,800

The proposed measure will greatly increase the opportunity for service of the Department of Agriculture in bringing about improvement in the vegetable crops of the country. (Applause.)

On a call for expression no response was made, and action was deferred.

CHAIRMAN STARE: We have with us one of the younger canners who has been coming to the front very rapidly in the last few years. So far as I know this is the first time he has ever addressed us publicly. I take pleasure at this time in introducing Mr. Joseph B. Weix, of Oconomowoc, Wisconsin. (Applause)

SEED PEAS

MR. JOSEPH B. WEIX: In no other crop growing industry is confidence between the seedsmen and the canner of greater value than in that of growing canning peas. It is therefore of utmost importance that seedsmen should not handle peas the stock of which they do not control. A canner in return should only buy from seedsmen who control and carefully guard their seed stock.

A seedsman sowing three bushels of peas per acre averages a return of fifteen bushels, of which must be kept for stock seed, leaving twelve bushels to sell. An average seedsman's acre, therefore, provides three acres for the cannery, whereas, an acre of seed sweet corn yielding forty bushels would provide seed for 160 acres of canning crop and an acre of tomatoes yielding 100 lbs. of seed produces sufficient seed to plant 1600 acres in canning crops. The above ratio of increase clearly indicates the relation of the seed crop to the cannng crop, which must at all times be maintained if the canneries are to be supplied with their wants.

The canning industry's greatest duty is to support the well established seed houses who own and control their seed stock, and who carefully guard this stock from mixtures and rogues. They are the greatest stabilizing influence for quality production by retaining purity of strain in their seed stock.

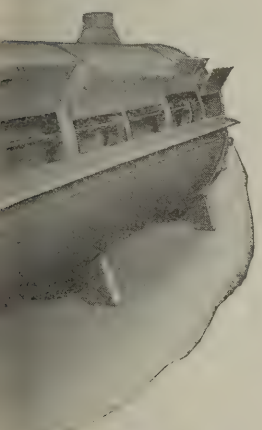
There is no place in the realm of the canned pea industry for the seed pea jobbers who operate so extensively during seasons when stock of pea seed is scarce in the hands of legitimate seed pea growers. The very ones who do the greatest harm in the industry appear to reap at times unbelievably high profits by forcing the price upward when the supply of seedsmen's seed is short. Every available pound of seed that has the slightest appearance of pea seed is bought up by these speculators, many times at ridicuously low prices, and in return it is sold as high bred, pure strain, field rogued Alaska or Sweet, as the case may be. Not only the canner who purchases this seed sustains a loss but the entire industry. It is a known fact that Bangalia, commonly known as Blue Bell Alaska, were shipped to canners this season.

The price of seed peas is a comparatively heavy item of expense, and it is perfectly natural that canners wish the price to be as low as possible. It is easy under present conditions to push the bargain for seeds so far that it becomes a very bad bargain for the canner. Some few seedmen see in the canner a man who looks only at prices he pays for his seed, disregarding quailty as a secondary matter. On the other hand, some few canners see in the seedsman a man only interested in a sale and regarding seed only as merchandise, with no care for quality in the least. There are possibly a few such seedmen and few such canners, but their numbers are fast disappearing.

The scientific study of seed for canning purposes today lies dormant and its vast fields unexplored. A group of Wisconsin canners recently however, pledged their financial support to a scientific research of 12,000 acres of this year's crop, under the supervision of the University of Wisconsin. Research work and scientific study are in the interest of the entire industry and therefore ought to have the moral and financial support not only of groups of individuals but of all concerned and particularly our association. (Applause)

CHAIRMAN STARE: I think at this time we will hear a little about "Plant Pathology". We have with us this afternoon a man who has devoted many years of hard work to this question of pea diseases, a part of the time without much encouragement, but later on with the financial encouragement of the National and State association and the work is now pretty well understood, but there are new things developing right along. I take pleasure at this time in introducing Dr. R. E. Vaughan, of Madison, Wisconsni. Dr. Vaughan's address is reserved for a later issue.

THE OUTLOOK—CURRENT EVENTS



By H. W. Phelps.

I think some of the current events that we have a right to look upon today are favorable, some of them perhaps not so much so, but on the whole I thnk I see progress; I think the most notable current event that has happened within the last few weeks is the Dawes report over on the other side. Whatever else may be the matter with the world, and the Lord knows there is a lot of it, perhaps the basic trouble has been the financial unsettlement, and that problem has baffled the best financiers, the best statesmen, on the other side beyond solution. I don't think there was a man in England, in Germany or in France who was able, living as he did under he conditions that were prevailing in those countries, subject to the influences that surrounded him on all sides, to correctly diagnose the trouble or suggest a remedy.

I think it should be a matter of pride (and it will be a matter of pride to Americans for generations) that a couple of hard-headed, practical, able Americans were able to go over there, taking to the questions that outside viewpoint which is always valuable, and diagnose those conditions and suggest a remedy which the nations of the world are almost unanimously endorsing and accepting. I believe that those two Americans have gone over there in that spirit of common business sense that pervades this country and have shown the way to the financial composure of the world; and if they have, they have done something that will put their names down in history as real heroes. I am glad that

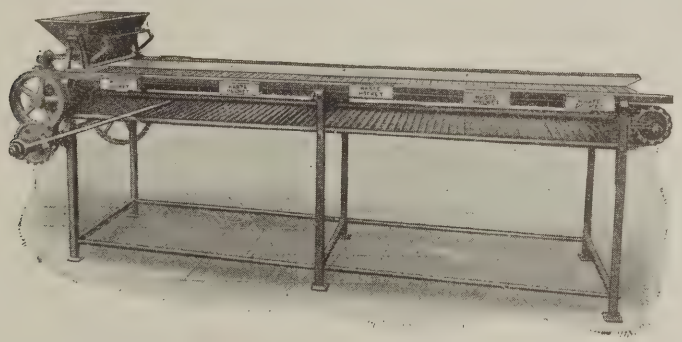
Sprague-Sells Pea Washer (Glass Type)

For the final washing and cooling after the blanch. Removes splits. An inexpensive machine that gives splendid results. Used by over 90% of the quality packers.

Well built throughout. Smooth surfaces—no pounding of peas. Movement of peas through washer controlled by baffle plates to permit maximum treatment by water sprays in minimum floor space.

Pans readily interchangeable, permitting use of any size perforation desired.



Sprague-Sells Pea Washer
(Glass Type)

Sprague-Sells Picking Tables

Illustration shows our metallic apron Picking Table, on which the peas are carried in straight rows in the depressions so that splits, stones and other foreign matter are easily seen and removed. No cracks or crevices to accumulate dirt. Easily cleaned and sterilized.

We also build rubber belt type tables in any size desired.

Sprague-Sells Picking Tables

The products of both our factories are sold through the General Sales Office in Chicago. We can supply from our own plants practically any machine you may need.

Whenever you are planning any changes or additions to your equipment, let us submit a proposal covering your requirements. When quick action is necessary, telegraph or telephone at our expense.

RY CANNING

uffalo, N. Y. and The Sprague-Sells Corporation, Hoopeston, Illinois

they are Americans! I am glad that we were able to do that for the world in a spirit of philanthrophy; I am glad that we were able to do it for the world because of our own selfish interests, because the financial ailments of the rest of the world are begining to undermine our own financial situation. It can't help but do it.

I believe that in this one thing we have something today in which to rejoice. I wish everything else were as favorable.

In our own land here we are in the beginning of a presidential year. There has been a tradition that a presidential year was not a good year for business, and as a rule I think that is true, there is a certain amount of uncertainty, a certain amount of diversion of the public mind and public attention to practical affairs. No business man who is interested in his country can absolutley ignore the fact that a presidential year exists, nor can he take out of his mind some consideration and some time for thought on affairs that have to do with his nation. I believe that is a man's duty as a citizen, and to the extent that that distraction from ordinary business affairs exists, there is a reason why a presidential year would be perhaps, as I said before, not a good year for business.

I do think that this year there are conditions presented which we have to scrutinize and to appraise and to use wisely because they are most important. It is our duty as citizens to do that.

I don't want to make a political speech; I am not a political speaker; I am not going to make a plea for any candidate or any party at all. I don't believe, geneltmen, that the American citizen today is so much interested in whether he belongs to one party or another. I believe that time has gone by, and I believe today that the cry trouble and the most serious menace to business conditions in this country and almost to the life of our nation is the shameless prostitution of business affairs and the welfare of the country sacrificed to partisan politics as we see it in the city of Washington. (Applause.)

The bonus and tax reduction are not politics; they are common, every-day business decency and sense. I don't believe there is any politics in an effort to drive out graft from our national legislation. I don't believe any Democrat or any Republican or any Populist or anybody else who is a right thinking man believes that that is a political question. It is a question that goes down into the honor, down into the foundation of our government and our nation. Of course, graft should be eliminated, of course dishonest men should be kicked out of office and put behind bars, be they Democrats, ,Republicans or what. We will all agree on that, and I don't believe that this spectacle that is going on in Washington meets the views of the man on the street, I care not what his politics may be.

That the halls, that have listened to the voices of Daniel Webster and Henry Clay, should now resound to the muck-raking and filth that is going on in Washington, is a disgrace to the United States and a disgrace to every man in the Senate of the United States. The rules of evidence are being violated as the most ordinary country lawyer before the most ordinary jerk-water justice of the peace would not dare to violate them. To what advantage? Why is it done? Just with the idea of trying to spurt a little oil on the other fellow who is in the other political party. I don't believe all the oil is on the Republicans or on the Democrats. I think there is oil enough in both parties or on the Democrats. I think there is oil enough in both parties. I think there is graft, I think there alwayss has been graft in the government of the United States and probably in the government of almost every state in the Union. You can't bring together as many men anywhere as you have in governmental affairs or in state affairs without finding some crooks among them. You can find crooks anywhere in any profession. You can find crooks in the Church of God but because you find them there, because now and then one of them comes to the surface, do you repudiate the religion of Jesus Christ? Do you say that the foundations of morality are shaken? Because there are a few grafters in the United States government do you believe that that splendid structure that was founded by our early fathers, and has been the glory and the honor of succeeding generations, is all rotten? Of course you don't! Neither do I.

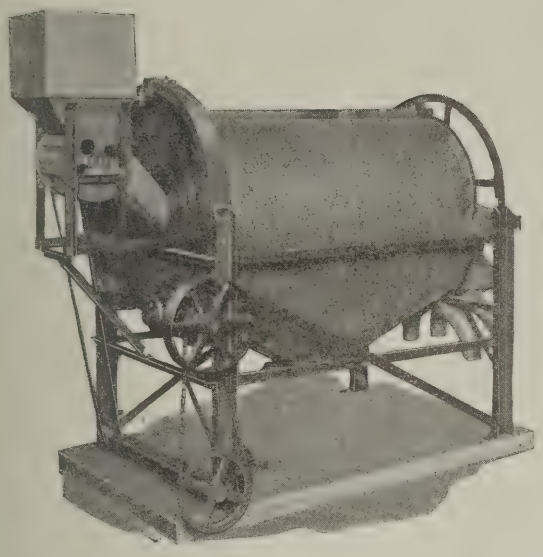
If there is graft down in Washington let's get it out, but let's get it out by the ordinary, simple processes of decent law and order. We have our institutions for law enforcement. The President of the United States has appointed two lawyers of national reputation, has charged them with the duty of investigating these things, and has in public print, and in public word, pledged himself to the eradication of graft, to the rectification of wrong and to the punishment of offenders. Why not let the Senate of the United States step aside and let the processes of law administered in that way do their work? They would be a good deal better off, and so would we.

Is there any politics in tax reduction? Can you tell a Democratic dollar from a Republican dollar when it is in the Treasury of the United States? Can you go up and down the streets of this town and look at the signs and at the business that is going on and tell who is a Democrat and who is a Republican? Can you tell when you pay your taxes that you are a Democrat or a Republican? The best you know is that you are pretty nearly "agin" the government when you pay them because they are too high. Therefore, I believe that tax reduction is not a political matter. We have got high taxes because we have war debts. We have war debts because the United States to a man earnestly, without party, without politics, rose to an emergency and spent that money. Much of it may have been wasted; I fear it was, but that made no difference, we did what we started to do and we did it as a united nation, and we incurred those obligations and piled up these taxes irrespective of party or politics. Why shouldn't we get down the same way? When it comes to a time for tax reducton it is the same for Democrats and Republicans. It is business, just ordinary, common sense business, and if two business houses or two banks were located across the street from each other and the men in charge of one happened to be Democrats and the others happened to be Republicans, would you find the business methods any different? They are all the same because they are subject to ordinary business laws and to common sense laws. Therefore, I think that the reduction of taxes is not a political measure and that any attempt to use it as a political measure is a prostitution of the most vital interests of every citizen in the United States who allows it to influence him in that manner.

I don't believe that any of these things are really affecting people. I think people think about them just as I do. I don't think I have said anything here that you don't all feel. That would be true probably if I were speaking to any similar group of men anywhere in the United States. But there is a psychology in these things. They produce a species of unrest, they produce questions, they unsettle men, they make them wonder what they are going to do next, or what is going to happen next. In other words, all this makes a man feel, if he feels rightly in these conditions, I think, that he should play safe and keep his feet under him. What does that mean? That begins to curtail business effort, it begins to shorten up business sales it begins to restrict business planning, and there we have the right to think about it.

I believe from what I can see of the business situation generally over the country that it is not as good as it was ninety day ago. I don't find in other lines of our business that touch a very wide scope of the business world, and I don't find from talking to men in other lines of business as I meet them that confidence or that enthusiasm, that "pep," if you want to call it such, in business matters that there was in the beginning of this year. Things are slowing up somewhat. I think they are going to slow up still more.

Employment is not as great as it was at the beginning of this year. I say that because in a large line of plants scattered throughout the country we find that there are more men at the gate looking for employment every day than there have been for more than a year. Other employers tell me the same thing.



Another thing I notice is that people don't want to buy for forward commitments nowadays. I believe that you men who have sold your futures and have your contracts for futures today are fortunate. If you had not sold them when you did I doubt if you could sell them now, at least to the extent that you have sold them.

I will admit that the canned foods market is in good shape, it is clean; there is every reason to believe that consumption under normal conditions will continue; it is going on at the present time. I have every reason to think that these future commitments will be met, but I don't believe many more of them will be made, and in other lines of business there is a distinct tendency to avoid forward commitments and to restrict business affairs to hand-to-mouth dealing. That is always the first indication of a slowing up in business. I trust that we won't go beyond that stage. I am not so sure that we won't.

I am giving you now in a very didactic way my own opinions. You can take them or leave them for what they are worth. I can only speak as I see and as I feel and as I believe.

There is a big crop coming on, as you know. The estimates that I have seen of the three big staples, peas, corn and tomatoes, and the reports that I get from the fruit section indicate that there is going to be a big pack if the stuff grows. If that is true, these business conditions that I suggest are more important to all of us six months from now after the futures are delivered and when you come to sell the remainder of your pack that you have not sold as futures. What is that condition

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graders, Colossus Pea Grades, and Other Canning Machinery.

DESERVED POPULARITY

Canned foods are gaining deserved popularity, because increasing care in canning process is insuring to the product its natural flavor, fine appearance and rich taste.

To produce these results, such precautions in sanitary cleanliness are needed that, increasing numbers of canners are specifying the use of

Wyandotte
Sanitary
Cleaner and Cleanser

for all their cleaning operations.

This preference is readily explained by the quickness and ease with which this product cleans and cleans clean the most complicated as well as the most simple of canning equipment.

It removes thoroughly all preventable causes of fermentation and decay. It purifies and deodorizes all stale smells and places.

It cleans so efficiently with so little effort and with such harmlessness to equipment or the user that it proves the most economical cleaner for use in the cannery.

going to be? If general business keeps good, if the working man is employed, he is going to continue to eat, he is going to have the money to pay for what he eats, he is going to eat your stuff; and if consumption will go along during the next winter as it has during last winter, you are all right.

On the other hand, if business slows up, if these conditions that I suggest become more drastic, if their effects become more pronounced, if unemployment takes place, you won't get rid of your surplus stocks so easily.

I don't feel that I can give you any advice or that I have any right to give you any advice as to what you should do in this condition so far as the pack is concerned. In fact, I think at least so far as the pea men are concerned it is too late because the pack is determined so far as the acreage is concerned, and a great deal of the planting.

I do think that every man, packer or business man or preacher or lawyer, is interested in the psychological condition that is being developed in this country, which is going to have and is having its effect on general business that I have outlined, and I believe that it is the duty today of every American citizen who talks to his neighbor or with his neighbor in a public way or in a private conversation to see that he talks common sense, that he talks a hundred per cent Americanism, that he states the faith that he has in him in the fundamental institutions of this country. We have got to believe those things, yes, we do believe them, they are a part of our life, we have always believed them, we were born to believe them, our fathers and mothers believed them. Of course, we believe in the institutions of the United States in a passive kind of way, but, gentlemen, it is time right now to believe in the institutions of the United States in an active, positive way and to see that your neighbors believe in them the same way.

I am not making a plea in any partisan way for the election of any man, but I do say this, that we have in Washington today a man who is President of the United States. That man is there charged with the duties of his high office, and so long as he is there he is entitled to the support, the sympathy, the encouragement and the help of every man, woman and child in this broad land, irrespective of party or religious faith. (Applause.) If he is not to be returned there, that is a different question, but until some other man takes his place he is the President of the United States; gentlemen, I believe he is honest, I believe he is courageous, I believe that God put that man in that chair at this particular time because he was needed, just as he put George Washington and Abraham Lincoln forward when they were needed. He has those qualities of cool, calm judgment and the courage of his convictions that is so necessary at this particular time. Whether he is a great statesman or not I do not say, I do not know; we don't know enough about that. Whether he should be re-elected or not I do not say and I do not know, but I do say, as I said before, that he is now the President of the United States, he is trying, I believe, his level best under God to administer the affairs of this country rightly and he has a right to our support.

All this boils down to this: Let us go ahead this year, let us practice, let us preach doing our best in the best way that we know how, keeping calm, cool, refusing to be stampeded or worried by what is going on. in other words, keeping an even keel, trying as best we can to keep the boat from rocking in these experiences that we are going through.

One other thing, and this is the only bit of politics that I am going to talk. Irrespective of politics or religious creed or anything else, if the people of the United States don't clean out that Congress and that Senate and put some men there who have got sense enough to do what they are put there for, they are bigger fools than I think they are going to be. (Applause.) I used to take off my hat to a senator; I used to walk into the Senate gallery with my hat in my hand almost as I would walk into a Cathedral. I wouldn't go in there today unless I was dragged in. I would be ashamed of myself for being there and I would be ashamed of every other man that was there. I honestly believe today that if there is one duty before the American people more than anything else, more than the duty to elect the right man or the wrong man for president, it is, irrespective of party, to get a clean, sensible, industrious Congress that is going to let up on investigations and reduce taxes and make a few laws, and a *very* few laws, that are safe and sane, and then shut up and go home. (Applause.) I don't think they can do anything better than that.

Continued Next Week.

RECKLESS OF HIM

First Cannibal—The chief has hay fever.

Second Cannibal—Serves him right; we warned him not to eat that grass widow.—Awgwan.

WONDER WHY

"He's quite an auto fiend, isn't he? Never seen without his car."

"But I saw him yesterday without it."

"That so? Where was he?"

"He was sitting on the cow-catcher of a locomotive with a steering wheel around his neck."

"SLAYSMAN DUPLEX TRIMMER—SLITTER"

Trims the sheet absolutely true, and drops it onto the feed bed of the Slitter where it is cut into the desired sizes—2's 3's 10's etc.

THE TWO OPERATIONS —TRIMMING and SLITTING—IN ONE.

Speed 60 to 90 sheets per minute, depending upon the operator. Saves labor, handling, time, and floor space.

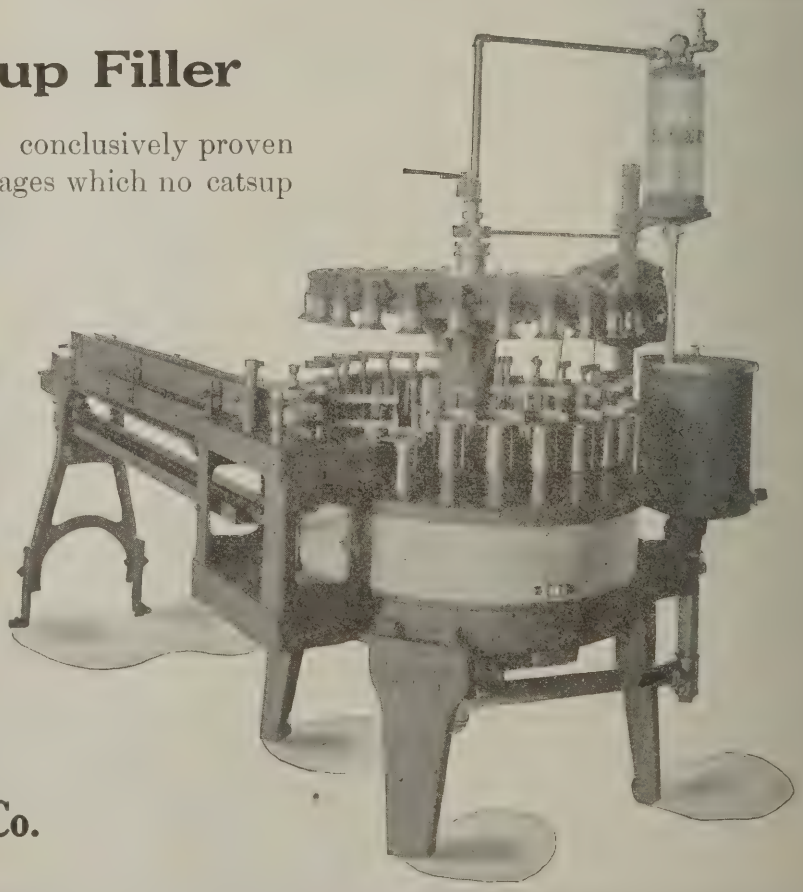
Built on rigid base to stand strain. Guaranteed.

SLAYSMAN & COMPANY 801 E. Pratt St., BALTIMORE, MD.

The Kiefer Catsup Filler

The new Kiefer Catsup Filler, having conclusively proven its worth last season, presents advantages which no catsup bottler can afford to overlook.

It fills without slop or waste and will not deposit catsup in broken bottles.



There is no perceptible loss in temperature when filling.

Metal contact is reduced to a minimum.

Nothing to take apart when cleaning at the end of the day's run.

We are willing to prove these things to you in your plant. Many manufacturers have already placed their order for this season.

Get your order in before it is too late.

The Karl Kiefer Machine Co.
Cincinnati, Ohio.

The Markets

BALTIMORE, MAY 5, 1924

WEEKLY REVIEW

essimism Follows Chicago Meeting—The Canned Foods Situation Still Strong—Necessity of Packing Quality—Tomatoes Show Slight Advance—Corn Strong—Fruits Improving.

AFTERMATH—The effect of that big meeting in chicago last week cannot be said to be helpful to the market, so far as 'feelings' are concerned. Most men came from it inking hard and not nearly so bright and cheerful as when they rst went to it. Secretary Roy Irons in writing the members of the Ohio Canners Association, after the meeting, said: Were you at the Western Canners Association meeting at Chicago last week? If so you were able to detect the trend of he times which would not warrant a man going out, cutting the rown out of his hat hallowing joyously to the four winds," verything is lovely and the goose hangs high."

And Secretary Irons went on to urge his members to pack uality only as the consumers, and the buyers are keen for uality and will not let pass only such goods. And this is good dvice. But whether or not the pessimism is warranted remains o be seen. Certainly the situation of canned foods has not hanged, except for the better. because people have kept right n eating canned foods, and the stocks of spot goods are smaller oday than they were yesterday. The spot canned foods market ever was in as good a position as it is today. And a new eason never opened with more favorable outlook than that of 924, because of the well cleaned up condition of all spot stocks. f the market were groaning under a heavy overload of spots, vith the new canning season coming on, one might look for essimism. But that is not the condition. It is true the preparations for the coming packing season are on a greatly enarged scale; that is the canners intend to plant and to can larger pack than last year. And the market will need it; will eed all the goods that they can get up. May be they can reak the market by the packs of 1924 but we seriously doubt t. And we know they won't do it if the goods are of a quality ind. That is the one black spot on the horizon, as we look t it; will the canners put up a grade of goods which will enice the buyers and consumers? Answer that question in the ffirmative and we will tell you where to go with your pessimism, nd where you belong. But pack them sloppy and in large mounts, don't be careful with what you pack; just pack it on he belief that "anything" will sell. and—May the Lord have nercy upon you. This country will never again eat its way ut of a pile of trashy canned foods, and if you help produce uch you ought to be horse-whipped.

TOMATOES—Everybody is wondering what's the matter with the tomato sellers. They have the market in their own hands, and they are not taking advantage of their opportunity. But this week they seem to have perked up a bit, and No 2s have reached the $1.00 mark again. No. 3s are trying to reach $1.50, but not yet, and No. 10s are on the move above $4.50. Even futures seem to show a little more strength, but the prediction that the buyers would be very light purchasers of futures from now on, together with the fact that there are still some canners who want future business, leaves this branch of the game in poor condition. Indiana has been well sold up on futures tomatoes for sometime, and California is advancing its tomato prices, but in spite of these supposedly known conditions, there are reports now that Indiana is easing off on future prices. The reports are undoubtedly market-jugglery, or one benighted canner's action magnified into a State action. Certainly the Tri-State canners and other tomato canners of this section cannot reduce their future prices any unless they mean to give their factories to the buyers as well as the goods. No one can see now how the tomato canners are going to come out even at present future prices.

CORN—Spot corn is cleaning up as predicted, and promises to be all gone before new goods can be produced. That is good work, and still better, if possible, is the determination of the corn canners to pack quality corn this year. The corn canners are awake to their job and we do not believe there is a self-respecting corn canner anywhere who has not set his standard high for 1924, and means to reach it, and stay with it. The corn canners have learned that the people will not eat poor corn, and that they won't waste money any more to throw the corn in the garbage can. It is make or break this year and the corn canners intend to make and not to break. The market for both spot and future corn is firm and advancing. Futures have been sold to a good volume, and many canners have withdrawn from the market, but the demand has not been filled as yet. Maine reports its canners practically sold up and demand still coming stronog. The same relative condition exists in most sections on corn.

SPINACH—Some very nice spinach has een coming in market for the past week or more and the canners are at work on it. The crop is late and it is not expected to be large, but the weather is now favorable for it, although more sunshine and warmth would help matters. The fresh markets are hungry for this spinach and the shippers are making life miserable for the canners, and running prices up on them. No. 2s are quoted at $1, No. 2½s at $1.40, No. 3s at $1.45 and No. 10s at $4.25 for May delivery. California had intended making a good pack of spinach this season,, but its crop was not up to expectations, and the output may not equal their plans.

SMALL FRUITS—The season is rapidly drawing near when strawberries and other small fruits will be on the tables. They are now coming from the fields in increasing quantities, and this interferes with the sales of canned fruits. The people

like the first fruits of the year and will pay high prices for the fresh article. There has been a better demand for fruits of all kinds in both spots and futures, and the outlook is for further improvement. California will pack upon the same basis as last year; that is, for such orders as are in hand, with little or no surplus, and the rest of the country will probably follow suit.

NEW YORK MARKET

Market Strong—Generous Tomato Canners Cutting Future Prices —The Foolishness and Injustice of It — Indiana Tomatoes Being Priced Down by Their Action—California Advances Tomato Futures—Hard to Find Any Peas for Private Label — Some Sardines Have Been Canned—Standard Corn Is in Steady Demand—Good Business in Stringless— News Notes.

New York, April 30, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

MARKET Strong—With one or two exceptions, the canned foods market has maintained its firm position during the past week, and demand has shown no signs of letting up. Many spot items are entirely out, and it is no longer a question of price with distributors, but rather one of physical inability to secure the stocks wanted.

Future Tomatoes—A few of the Maryland or Delaware tomato canners, actuated possibly by philanthropy, but more probably by their complete lack of knowledge of, or disregard for, costs are reported cutting the market on new pack tomatoes. Prices of 85 cents for 2s and $1.25 for 3s have been heard of. Possibly, this price is confined to one or two canners, but it is common knowledge that while news of an advancing market finds its way but slowly to the buyers' ears, the mere rumor of a decline spreads like wildfire. If statistics of reliable canners are to be credited, and there is no reason to suppose otherwise, the prices quoted above are at or below, production cost. Even though a canner is willing and able to operate without a profit or even at a loss himself, that does not appear to justify him in forcing his many contemporaries to do likewise. In the face of a strong market for almost every item in canned foods, it appears extremely poor business, to say the least, for any canner to cut the market below the moderate opening basis which has been made on tomatoes.

Indiana Future Tomatoes—The low prices named by Eastern tomato canners have affected the Indiana market, and some offerings have been noted at 95 cents for 2s and $1.35 for standard 3s. These prices are 5 cents per dozen below the original opening basis, at which considerable business was booked.

California Tomatoes—Some of the California canners have advanced the market on new pack 2½s, future shipment, to $1.12½ per dozen this representing an advance of 2½ cents per dozen.

These prices apply on the packs of the smaller canners. The larger packers, with established brands, are quoting higher. The $1.12½ price applies to standards in puree.

Pineapple—According to the trade here, there is "a good movement" in Hawaiian pineapple, but there is no denying the fact that there is still plenty to go around, in marked contrast to to the position of the market at the corresponding period last year and the year before. It is believed that production and consumption of canned pineapple have now become about evenly balanced.

California Fruits—The California Packing Corporation has announced a new price basis governing its unsold holdings of 1923 pack fruits. The list shows slight advances over the prices made about three weeks or a month ago. The significant feature of the new list is the announcement by the Corporation that the new prices are guaranteed against formal opening prices for 1924 pack. The Corporation suggests to jobbers the advisability of their anticipating summer requirements at present prices. Under the guarantee clause, buyers are protected fully against any possible depreciation in the value of their purchase by the naming of lower prices for the 1924 opening. In addition, if the 1924 opening prices are higher than the spot prices now quoted, buyers who "come in" now will have a profit on their goods. The Corporation will make shipment on orders entered now as late as June 15, 1924. There has been quite a little interest shown in the new prices, as it is believed that the formal opening for 1924 will show still further advances on some items.

Peas—Active inquiry for the general line is reported, with an acute shortage of standard grades reported in some quarters. Private label jobbers are having a hard time of it in keeping their line full, and some of them are advising the trade that they will have to await the first shipments of 1924 pack to replenish stocks on some grades. As might be expected, under these conditions, the market is extremely firm. Futures are strong and in demand, with very little offering from the packers of the wanted brands.

Salmon—Movement continues slack. The retail trade bought in fair volume for Lenten season, and it is expected that stocks remaining over will take care of the demand for a little while yet. A spell of early hot weather, many believe, would see a real spurt in salmon, with a cleaning up of the weak holdings which have been affecting the market here.

New Sardines—There has been a little sardine packing by the Maine canners, but the pack is not yet large enough to be much of a factor in the market. The market on new pack is nominally quoted at $4.75 for keyless quarter oils, $5.25 for three-quarters in mustard, and $5.50 for mustards in cartons. The carry-over of 1923 pack is virtually cleaned out. The packing season in California has come to a close, the market being in a very healthy condition. Active buying by both the domestic and export trades has cleaned up holdings.

Corn—There is a steady inquiry for standard corn, and the market is showing a firm tone, both on spot and in primary markets. Chain stores are featuring standard corn in their advertising, and report a good movement. Fancy corn is in very short supply, and new brands are making their appearance in the market as jobbers find their regular sources of supply unable to take care of their requirements. For instance, one leading chain store which has always used Maine and Michigan corn for their line of fancy, now has only Illinois to offer. Maine and Minnesota fancy corn for private labels is about through, the jobbers are being forced to pick up resale lots for their own brands, at full market prices.

String Beans—There has been a very good future business on New York and Michigan pack string beans, stringless beans, etc., and many of the better known canners are practically sold up on their well known brands.

Notes of the Trade—Harry P. Strasbaugh, well-known Maryland canner, was in the market this week.

Two ex-presidents of the National Canners' Association were here during the week, "Judge" James Moore, of Rochester, and "Jimmy" Anderson, of Utah.

CHICAGO MARKET

Want Spots, but Not Interested in Futures—Pushing Salmon—Fresh Strawberries Plentiful—Jobbers Are Worried Over Suits in California and the Consent Decree Matter—Complain That Canners Do Not Pay Their Brokerage Promptly.

Chicago, May 2, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

BUYING Spots—The canned foods market has reacted a little this week, as to general interest and the brokers report it somewhat dull. The wholesale grocers are not disposed to buy futures in any line, but are interested in all spot offerings for prompt shipment, in almost every article in canned foods.

There seems to be some pressure to sell high grade salmon and I have heard of offers being accepted, below the prevailing coast price, for shipment in carload lots to Chicago. The recession only amounted to five cents per dozen, but indicates an anxiety to sell on the part of some coast holders.

The reports from the Ozark District of Southern Missouri and Northern Arkansas are to the effect that the outlook for a heavy crop of apples, peaches, pears and berries is good. The blossoms are about all fallen and the small fruit has appeared on the peach trees and gives promise of an abundant yield.

Fresh strawberries are in the Chicago market abundantly and are being retailed by grocers at 17c a box, and green string beans, and cauliflower from Florida are here abundantly, and are being sold at low prices. It seems to me that this southern

fruit and vegetable matter is one that the canners will have to seriously consider, but what can they do about it?

I am reminded of Mark Twain's comment about the weather. He said that everyone was always talking about the weather, but no one ever seemed to do anything about it. I reckon the canners will have to pack canned foods so fine in quality that people will prefer them to the fresh fruits and vegetables; and they can do it.

The echoes from the big convention of the Western Canners Association are still reverberating in Chicago. The interest in the meeting was justified by the value of the papers presented and the high order of the addresses made.

The wholesale grocers are considerablv disturbed by the reopening of the meat packers Consent Decree at Washington in the Supreme Court of the District of Columbia, and the open appearance in the matter by Armour & Co. and Swift & Co., and are determined to fight the matter to a finish.

They are also somewhat disturbed by the filing of a suit at Los Angeles, California, in the Federal Court against the California Wholesale Grocers Association, the National Wholesale Grocers Association, and a number of Wholesale grocers of California. The complaint by the government is that the defendants have acted in restraint of trade and in violation of the Sherman Law of 1890, the chief detail being that they thereby prevented some chain stores from buying from the manufacturers direct through a conspiracy of action or influence. The wholesale grocers say that they will try the case in the courts and not in the press, and that they are confident of acquittal.

There are several changes in the brokerage business in Chicago, and several others are rumored to occur and when definite information can be had such changes will be mentioned.

I participated in a conversation with a group of brokers this week, and they were bitterly complaining that the canners, or many of them, were very neglectful and inconsiderate about paying them their brokerage earned. They stated that their brokerage should be remitted to them as soon as the canner received payment for the goodsfi asit really was not the canners right or privilege to withold the brokerage for six months or more as was sometimes the case.

One broker said that the sales now days were so small and had to be made such hard work, and brokers frequently needed money so, that canners should refrain from such treatment. The broker referred to said htat he now had about three thousand dollars ni brokerages earned and collected by canners of the buyers on his books and that all his dunning and begging for the money seemed to meet with no response, and that he did not understand the treatment as he was confident that the canners were comfortable financially, and could pay if they chose to do so. He said that he would have to quit making sales for canners who were so inconsiderate in witholding payment of earned brokerages, and confine his sales to those who paid promptly. That is a serious matter, and should be corrected.

ST. LOUIS MARKET

Canned Foods Are Dull—Early Spring Buying Has All Ceased—Fresh Products Have Been Cheap and Plentiful — Only Routine Demand for Corn—Ignoring the Tomato Futures—Moderate Priced Peas Wanted —Bumper Crops of Fruits Seen.

St. Louis, Mo., May 1, 1924.

By "Missourian,"
Special Correspondent "The Canning Trade."

MARKET Dull—There has been dullness prevailing in canned foods in this market the past week. Most lines were neglected, although there has been the usual hand-to-mouth trading going on. Up to recently there had been a fair spring volume of business, but recently trading has fallen off to such an extent that it hardly equals the normal requirements. All varieties of canned foods are included in the general lull of business.

Narly all buyers, both large and small, are going on even a more conservative basis than they did, and continue their hand-to-mouth basis on all packs, no matter what the position of the market or the outlook may be. Supplies of many leading staples are very light as cleanups. Future trading is dull because dealers are not in sympathy with packers as their ideas of sellers who want more for their 1924 lines than they did for the old pack.

One of the reasons probably why the canned foods movement has been disappointing lately and at the present time, besides the financial and industrial situation, which have compelled dealers to follow an extreme policy of conservatism, has been the fact that fresh produce has been plentiful and at prices reasonably cheap, and buyers prefer the fresh products to canned foods. They can get the canned foods when the fresh products are not available.

Corn—Standard corn is steady and quiet, and there is no spot surplus. The demand is only routine. There is a great scarcity continuing in strictly fancy, and this condition will exist until the new pack comes in. The future market is slow.

Tomatoes—The usual quietness in the market prevails. Spot Southern and California packs are quiet, as most distributors have enough of their own goods to keep them going, and the consuming demand is not large. Futures are practically ignored because buyers have the idea that to book a large volume of business, canners might be prevailed upon to make a large pack. The market has been very peculiar recently in respect to the Southern pack. Threes have been neglected, and ones and twos have taken its place. Threes are not a popular retail seller. Gallons are not active just now, but canners have been carrying them for the spring market.

Peas—One of the strongest items on the market is peas, because of the shortage of the cheaper grades. Retailers are calling for the popular priced lines on which it is impossible to replace. The grocers do not like to take other grades and higher prices in their place, but they are being obliged to do so. This is throwing the demand to packs that have not sold freely. Canners cannot offer any other kind than these. Southern pea packers are worried about the backward season, which is several weeks backward compared with last year. They would have liked pea packing to have been early, so they could take advantage of the early market, when old goods were nearly out of the market. Very little future business is being done, as the average canner is sold up on his anticipated pack.

Fruits—Spot California fruits are continuing to get higher on the coast, with peaches and apricots in the lead. Cling peaches in all grades are going higher and higher, and offerings are less than they have been. There will be a close cleanup on every item, according to information received here, and jobbers' stocks are light. Unsettled conditions prevail on futures because canners cannot estimate just what pack there will be or its cost, so they hesitate to state opening prices. What quotations have been made have, in many instances, been withdrawn.

Prices on both vegetables and fruits are practically the same as quoted last week.

The R. T. Bridwell Canning Co., of Republic, Mo., has begun work on a new canning factory, which will have a sufficient capacity to handle 450 acres of tomatoes and other fruits and vegetables. A large well has been drilled to insure water supply. The structure will be strictly modern and will be built after the latest improved plans. The old factory is to be razed. In addition to the main building, a large warehouse also will be erected.

Big Fruit Prospects—According to information received from West Plains, Mo., the fruit growers of the famous "Fruit Belt" of Southern Missouri, are jubilant over the prospects of a bumper yield this summer. It is believed the danger of killing frosts has passed. The orchards in that section are all in splendid condition, and since the trees have had a rest, as a result of the killing frosts late last year, the size and quality of the fruit this year should be exceptional. Spraying of the orchards has begun, and every possible effort made to make the best of the auspicious forecast.

A part of the crop in the Pomona and Olden districts was damaged by the severe weather during the latter part of the winter, and the crop will be a little short there. The damage, however, was over a short area, and in the famous Koskonong-Brandsville district, southwest of West Plains, the trees have began to shed their blossoms and are loaded with tiny peaches. Apples, pears and all of the small fruits and berries in this section are also in good condition.

Officials of the Merchants Dispatch and the Frisco Railroad have just made a tour of the fruit belt of the Arkansas and Missouri Ozarks to acquaint themselves with the fruit prospects and to make an estimate as to the number of fruit cars that will be needed during the growing season. From Republic, Mo., the experts went to Billings, Aurora, Marionville, Monett and Saroxie. The Frisco recently singed a contract with the Merchants Dispatch, whereby the railroad will receive a large number of refrigerator cars for use in transporting fruit products of that region. The Ozark section is fast becoming one of the important fruit centers of the country, and better and quicker transportation must be afforded by the railroads than in former seasons. The strawberry acreage has been greatly increased, and the grape production is becoming an important part of the fruit industry in Missouri and Arkansas.

CALIFORNIA MARKET

The Epidemic Affects All Lines of Business—Embargoes Make Serious Trouble—Shipments Are Made on Certificates—Asparagus Canning in Full Swing—Spot Fruits Have Walked Down to Low Stage—Light Salmon Pack Predicted—Notes.

San Francisco, Cal., May 1, 1924.

By "Berkeley,"
Special Correspondent "The Canning Trade."

EXCITEMENT—The all-absorbing topic of discussion in California business circles is the hoof-and-mouth epidemic among cattle and its effect on industry in general. At first a source of loss only to cattle owners and others connected with the meat and dairy industries it has become a serious menace to the prosperity of the entire State and every agency of the Federal, State and County Government is being directed toward stamping it out. The losses to cattle growers have become almost infinitesimal, compared with those incurred in some other lines as a result of the embargoes placed on products of the soil and the restrictions placed on travel. Authorities are almost a unit in declaring that some of the measures adopted by outside communities to prevent the entry of the disease are absurd, and declare further that much heavier damages are being brought about by hysteria than by the disease itself. An urgent appeal has been sent to President Coolidge to have him use his power in bringing about a modification of embargoes on California products and to centralize control of the situation in California. Dr. U. G. Hauck, personal representative of Secretary of Agriculture Wallace, is representing the Federal Government in the fight on the disease, and will be in charge from now on. He had had previous experience in work of this kind and anticipates an early curbing of the epidemic. For the benefit of California shippers, certificates will be issued by the Federal Government for products moving in interstate commerce, and no products may move without such certificates. This measure has been adopted as a means of assuring neighboring States of the non-infection of fruits and vegetables which would move through their territory. No assurance has been received that States having embargoes against California shipments will respect the certificates, but it is hoped they will do so.

The most serious outbreaks of the hoof-and-mouth disease are now in Los Angeles county, which is a heavy shipper of fresh vegetables. These shipments are being interfered with, and losses in some lines are heavy. The melon crop in the Imperial Valley will soon be ready to move, and should restrictions be placed on this, many growers and shippers would be ruined. Not content with prohibiting the shipments of fresh fruits and vegetables within their borders, some States have even held up shipments of canned foods, fearing that these might come from some warehouse in the infected area. Those acquainted with the disease declare that such precautions are absolutely unnecessary, and that in the six previous outbreaks of hoof-and-mouth disease in the United States not once has infection been traced to a product of the soil. European products are shipped freely over the entire United States, even from districts where the disease is prevalent, but no case has ever been discovered where these products introduced the disease into the United States. The embargo on fresh fruits is branded as a colossal mistake, and the embargo on canned foods nothing less than an absurdity.

Asparagus—The packing of asparagus is in full swing in the delta district, but the fields are badly in need of rain and the season may be a short one, unless there is added moisture shortly. A falling off in shipments of fresh "grass" has been noted of late, and canners are getting more than their usual share of the crop. The California Packing Corporation, which recently put out its definite price list, quoting some lines higher than in the tentative list issued early in the season, has since put out another. No price changes are noted, but there have been withdrawals in a number of lines, particularly in No. 2½ large, No. 1 large tips, and in tips packed in picnic tins.

Fruits—In general, the wholesale trade is buying spot fruits only as needed, but business is of fair volume, and stocks are getting down to low compass, even on cling peaches, of which there has been a surplus. Prices have been advanced several times during the past two months in sympathy with the close cleanup, the prospects of higher packing costs and the outlook for light crops. Apricots, pears and cherries occupy a strong position in the market at present. Hawaiian pineapple has staged a real comeback, and is being purchased more freely by the retail trade than in some time.

Sardines—California sardines are in comparatively light supply, and the demand is coming from a broader field than in many months, with many calls for export. Chinook salmon is moving in a small way, with purchases confined to immediate requirements, but there is a good call for pink salmon, and even for chums.

Salmon—A light salmon pack in Alaskan waters is forecasted as a result of the deadlock between union fishermen of the Pacific Coast and leading packing firms, including the Alaska Packers Association, of San Francisco. Several vessels of the fleet of the latter concern have sailed for the fishing grounds with full crews, but it is likely that the full fleet will not leave port. Canners are offering fishermen 7 cents a fish, and claim that they cannot pay 7½ cents, the rate paid last year. They claim that last season many fishermen made from $1,000 to $1,800 on the cruise of four months. Fishermen want 9 cents a fish in the Nushagak district and 8½ cents for those caught in the Behring Sea.

The Columbia Salmon Co., of Seattle, Wash., has filed a voluntary petition in bankruptcy, with liabilities of $677.000 and assets of about $76,000. This concern has conducted fishing and canning enterprises in Alaskan waters.

Coast Notes—Gross sales of Hunt Bros. Packing Co., San Francisco, Cal., amounted to $4,355,971 during 1923, with profits from sales of $364,339, according to the annual report of the company recently made public. The ratio of current assets to current liabilities is slightly more than three to one.

The plant of the Manteca Canning Co., Manteca, Cal., has been closed, following a short run on spinach. It will be reopened when other products are available.

The offices of the Winters Canning Co. have been removed from the St. Clair Building to 110 Market street, San Francisco, Cal.

The Canners League of California recently took the matter of summer school vacations up with San Francisco and State authorities, with the result that the local schools will be reopened for the fall term three weeks later than usual. This will permit San Francisco residents who work in the fruit industry during the summer and who find it necessary to return to the city in time to put their children in school to work later than heretofore.

Killing frosts visited the Pacific Northwest on April 24, causing heavy losses in the Willamette Valley, Central Oregon, Eastern Washington and Idaho.

L. I. Herrington has been made general manager of the Edward W. Brown Co., extensive handlers of canned foods, San Francisco, Cal. Mr. Herrington has been with the company for seven years, and previous to this was with the California Packing Corporation and with the Pratt-Lowe Preserving Co

A. M. Lester, of the California Packing Corporation, San Francisco, Cal., plans to visit leading Eastern business centers shortly, and upon his return will make a trip to Alaska to inspect some of the canneries of the Alaska Packers Association.

SEATTLE MARKET

Trading Quiet — The Mud-slinging Reaches Salmon Canners—Consent Decree Interests These Canners—S. A. P. Business Good—Fair Bookings of Future Fruits.

Seattle, April 30, 1924.

By "Nomlas"
Special Correspondent "The Canning Trade"

THE Market—Spot trading has continued quiet along routine lines during the past week, and no quotable change in the price basis has been reported. Jobbers are coming into the market rather slowly for their spring requirements. Holders, however, are making no efforts to force the situation, and are confident of their ability to market the remainder of their stocks at full prices.

Politics—The local trade is showing some interest in a series of stories from Washington, in which the charge is made that the present administration is favoring four of the larger Alaska packers, and has attempted to "turn over the vast salmon interests of Alaska" to these few packers, to the detriment of the

consumers of the country and other commercial canners. This campaign is apparently an offshoot of the mud-slinging which has become so important a feature of Washington official life, and is not taken seriously as yet. The various restrictive measures put before Congress, however, in which commercial fishing in Alaska waters is greatly curtailed, are causing concern in the industry, and have been vigorously opposed.

More Salmon Outlet—The salmon canning and distributing trade have been greatly interested in the recent developments as affecting the status of the packers' consent decree. The report that there is a possibility of the big Chicago meat packers again becoming distributors of canned foods has created considerable comment among salmon canners. The Chicago packers, when operating as wholesale grocery distributors, were heavy purchasers and furnished a good outlet for large blocks of salmon.

Futures—Market interest is centering in the future salmon situation. S. a. p. business has been rather good thus far. Packers are talking $1.25 for new pack chums and $1.30 for pinks, but it is not believed that the jobbers of the country will come in at these figures, in view of the fact that these prices show advance of 5 cents per dozen over the prevailing spot quotations.

Canned Fruits—Interest in the spot canned fruit situation was rather a negligible factor in last week's market. Canners are practically cleaned up, and are exceedingly firm in their prices on the small stocks still on hand. Future Northwestern fruits, however, are attracting increased interest, and fair bookings have been made thus far. NOMLAS.

MAINE MARKET

Spring Late and Season Backward—Future Corn Sold Up, but Demand Not Satisfied—String Beans in Same Fix—Sardine Factories Open, but No Fish—Lobster Prices Too Low.

Portland, Maine, May 2, 1924.

By "Maine,"

Special Correspondent "The Canning Trade."

SEASON Late—General trade conditions remain very quiet. This is nothing new, as the entire year so far has been dull and the opening of the spring season has not brought the usual activity; this may be because the spring has opened yet only by the calendar, the weather continuing cold, with an entire absence as yet of the usual bright sunny days which go so far to encourage all conditions. This is having a decided effect also on the canning interests, as the ground is very late and even now is too wet for "working" preparatory to planting.

Future Corn is now so closely sold up to the estimated yield on present acreage that there are no offerings of any amount in the market. The usual demand is by no means filled and there is an effort to increase the acreage if possible, but owning to the late season, combined with very difficult farm-labor conditions, this seems almost impossible. Crosby corn is strong, rather gaining favor again over the Golden Bantam, which has had such a sudden rise in popularity. Crosby at $1.45 and Bantam at $1.70 are still the current quotations.

Stringless Beans have also sold right up to the present acreage, and still there is a demand. And there is much less hope of increasing the volume on beans, owning to the fact that they are necessarily planted even earlier than corn and there is consequently less time to secure acerage, prepare the ground and get the crop started. No. 10 beans at $6.00 and No. 2s at $1.35 have been the quotations ever since new goods were put on the market in February.

Sardines have been offered to the trade at $4.35, which is rather lower than was anticipated and indeed too low to make any canner rejoice. However, this is the price, and goods are already being contracted for. While the season is open the factories are not, owing to the lack of fish; as usual it will probably be well into June before enough stock is received to occupy the factories to capacity. Such new goods are now being produced, by only three or four of the many factories in Maine, are going into quick consumption.

Lobster prices were announced by some of the canners a fortnight ago, but not all were willing to do business on the basis quoted. Burnham & Morrill Co. have now made their announcement of prices for the 1924 stock, on a basis of $4.60 for halves as against the earlier figures of $4.00. Their other quotations are: No. 1s $8.60 and quarters, $2.50. Their advance in prices rather indicates that the season is not opening up as well as was anticipated, and that the market will be rather lacking in lobster bargains this year.

What The Brokers Say.

Aberdeen, Md., April 30, 1924.

Tomatoes—The increased demand for spot No. 2 tomatoes has forced the price up to $1.00 per dozen on this size under packer's label, with some holders asking $1.10. As a matter of fact, there are only a few lots available at $1.00 per dozen. The other sizes have been temporarily neglected and it is possible to buy 1s at 60c, 3s at $1.35 and 10s at $4.50 per dozen, in carload lots only. Unlabelled tomatoes are not obtainable under $1.05 for 2s and $1.40 for 3s.

The market on future tomatoes is unchanged. We can fill orders according to brands for shipment when packed at 55c to 57½c for 1s, 85c to 90c for 2s, $1.25 to $1.30 for 3s, and $3.90 to $4.00 for 10s, f. o. b. respective shipping points.

Corn—The corn market is unchanged. We are booking orders for future corn at $1.15 for standard shoepeg, $1.25 for extra standard shoepeg, $1.35 for fancy shoepeg, and 90c to 95c for crushed sugar corn, all f. o. b. factory.

Sweet Potatoes—The market on spot sweet potatoes seems to be cleaned up. We can offer new pack sweet potatoes for shipment, when packed, at $1.20 for 2½s, $1.25 for 3s, and $4.00 for 10s, f. o. b. factory.

C. W. BAKER AND SONS.

ST. LOUIS CANNED FOODS WEEK PRIZES

The St. Louis Wholesale Grocers Association offered a series of prizes for the best slogan during Canned Foods Week. Here are the winners, and the three champion slogans.

The winners of the Canned Foods Prize Slogan Contest have been selected by the judges.

We, the undersigned judges of the Canned Foods Prize Slogan Contest, have examined all of the slogans submitted in the contest for prizes for the fifty-three best slogans and the following is our selection:

First Prize—$100.00 in gold—Mr. O. J. Goldschmidt, 2523 Fall Avenue, St. Louis.

"Among the best foods in the land
You'll find that most of it is canned."

Second Prize—$25.00 in gold—Joe Ravenstein, 1007 S. Sprigg Street, Cape Girardeau, Mo.

"From the garden to the table
No deception on the label."

Third Prize—$10.00 in gold—W. Lindsley, 2832 Lafayette Avenue, St. Louis, Mo.

"The garden's selection
Packed in tin
With all the goodness
Sealed right in."

There were 50 other prizes, mama dolls and roller skates being awarded to each winner.

BERLIN NOW REPRESENTS MORRAL.

THE Berlin Canning Machinery Works sales department has taken over the agency for the Morral Huskers west of the Allegany Mountains.

This is purely a sales agreement, as the Morral Husker will still be built by the same organization, and it will work to the mutual advantage of both companies, as it will give the Berlin Canning Machinery Works a complete line of corn canning machinery to add to their other complete lines of milk canning machinery, pea canning machinery and tomato canning machinery.

FITS AND FITS

"So Mrs. Bang had several fits last week?"
"Yes."
"Did she call a doctor?"
"No—a dressmaker."—Sun Dodger.

What Canned Foods Distributors are Doing

Trade Greatly Interested in Proposed Cooperative Advertising Campaign for Canned Foods—Two Big Conventions Holding Spotlight at Present—Decision Consent Decree Hearing Goes over—Notes of the Trade.

The Advertising Plan—Wholesale grocers, canners, and all other interests identified with the packing and distribution of canned foods will shortly be united in a comprehensive organization looking towards the placing of the story of canned foods before the public in its proper light.

A preliminary meeting attended by several prominent wholesale grocers and canners was held in Chicago last week, and this was followed by a meeting in New York this week. Inasmuch as the plans have not yet been fully worked out, leaders in the movement do not consider it advisable to place the full story before the trade at this time.

Several prominent members of both the canning and wholesale grocery industries, aided by representative brokers and can manufacturers, are at present considering detailed ideas for the proposed publicity campaign, and it is expected that full details will be available some time within the next fortnight.

It is hoped that the plan will have progressed sufficiently to be placed before the American Wholesale Grocers' Association at its meeting in Dallas, Texas, May 13 and 16, and it will then be outlined to the members of the National Wholesale Grocers' Association in Chicago later on in May.

Leaders of all branches of the industry appear thoroughly "sold" on the idea, and with much of the friction which characterized the former canned foods advertising campaign eliminated, and with the experience gained in that campaign to profit by, it is probable that real and lasting good will come of this new proposed campaign if anything like the proper support is accorded it by all interests.

The Concent Decree—Argument was concluded last week in the Court of Appeals of the District of Columbia on the appeal of the California Co-operative Canneries, in the proceeding brought by them, to intervene for the purpose of setting aside the consent decree entered against the "Big Five" Chicago meat packers. The argument was heard on April 22 and 23. Wm. C. Breed appeared for the National Wholesale Grocers' Association, Edgar Watkins for the American Wholesale Grocers' Association, Frank J. Hogan for the California Co-operative Canneries, Conrad H. Syme, for Armour & Co., Charles A. Douglas for Swift & Co., and Herman J. Galloway for the Government.

The Government, as well as the National Wholesale Grocers' Association and the American Wholesale Grocers' Association, have been granted permission to file additional briefs, in view of the fact that the Swift and Armour groups of defendants have filed their briefs and argued in this proceeding. The grocers and the Government are permitted ten days in which to file their briefs, and the packers ten days thereafter in which to file brief replies. It is not expected, however, that decision in the matter will be received before June.

Armour & Co. have applied for a rehearing on the denial by Judge Bailey of its plea for additional time in which to dispose of its unrelated lines and to relinquish control of its companies engaged in the manufacture of such products. and this plea is now under advisement by the Court.

Both the wholesale grocery and the canning trade are showing the keenest interest in these proceedings, as it is generally felt that the meat packers desire to enter the field as wholesale buyers and distributors of canned foods and other grocery products.

The American Convention—Everything is in readiness for the annual convention of the American Wholesale Grocers' Association in Dallas May 13 and 16 and plans are being made to handle a large attendance. Many prominent members of the grocery trade are on the program, including the following: Hon. A. B. Williams, Michigan, chairman, author of the Williams resale price bill: Lynn P. Talley chairman of the Federal Reserve Board of Dallas; Royal F. Clark, president of the National Canners Association; W. W. Frazier, Jr. president of the American Specialty Manufacturers' Association; Charles P. Whiteman, president of the National Food Brokers' Association; C. W. Linthicum, secretary of the Arkansas Wholesale Grocers, Association; C. W. Dunn, general counsel of the American Specialty Manufacturers' Association; Fred Mason, vice president American Sugar Refining Co., J. T. Griffin, president Griffin Grocery Co.,, wholesale grocers of McAlester, Oklahoma; W. T. Bolton, vice president Boren-Stewart Co., Denton, Texas; H. G. Craft, president Bernet, Craft & Kauffman Milling Co., of St. Louis; John Coode, director of the National Association of Retail Grocers, and Edgar Watkins, general counsel of the American Wholesale Grocers' Association.

The National's Convention—The program committee of the National Wholesale Grocers' Association. in charge of the 1924 convention to be held in Chicago, May 27-30, are completing elaborate arrangements presaging what is expected to be one of the most practical, helpful and enjoyable conventions in the history of the National Association. Plans are moving forward rapidly under the leadership of Fred C. Letts, chairman of the 1924 convention committee, and hisc corps of Chicago assistants.

The 1924 program provides for a four-day convention period. The first two days, Tuesday and Wednesday, will be thrown open for informal discussions by wholesale grocers of pertinent problems now interesting the trade. The guests of the convention, including all factors interested in food—manufacturer, canner, broker, retailer as well as consumers—will through these sessions, it is planned, be permitted to hear authoritative discussions by practical men of the problems of feeding the nation. There will be two informal sessions of the convention on Tuesday, May 27, morning and afternoon. The morning session will open at 10 o'clock,, Chicago daylight saving time. There will also be a session on Tuesday afternoon.

There will be just one session, morning, on Wednesday, when the informal discussions of Tuesday will be continued.

The convention will be formally opened with President J. W. Herscher, the "Iron Man," of Charleston, W. Va., in the chair, on Thursday morning. There will be no session in the afternoon. The annual banquet will be held on Thursday evening, and the Chicago committee predict a big time. There will be a speaker of international fame, music, singing and a dance the music for which will be furnished by an orchestra famous from coast to coast.

The convention will adjourn following the most important of all the sessions, Friday morning-early afternoon.

Inasmuch as President Herscher has completed three terms, another term. It is probable that a Westerner will get the presidency for the coming year, as Eastern wholesale grocers have held this honor for some time past.

The Government's Suit—There have been no further developements in the Government's suit against the California Wholesale Grocers' Association, the National Wholesale Grocers' Association, and numerous individual members of both organizations The Government in its suit charges restraint of trade, but details of the charges are not yet fully known. The grocers involved, however, are showing surprisingly little concern over the suit.

Sectional Meetings—Plans have been perfected by C. W. Linthicum, secretary of the Arkansas Wholesale Grocers' Association, for regional meetings of wholesale grocers at Memphis and Fort Smith, following the close of the American's convention in Dallas. These zone meetings are planned in order to bring about a clear understanding of some of the trade problems affecting the Arkansas and adjoining trade territories.

Notes of the Trade—John B. Newman, traveling representative for the National Wholesale Grocers' Association, is visiting New York this week, after having visited wholesale grocers in more than twenty states thus far this year.

Samuel H. Phillips, pioneer Southern wholesale grocer, died at his home in Memphis early in April.Mr. Phillips was former president of the Shanks-Phillips Co., of Memphis, and served as president of the American (then Southern) Wholesale Grocers' Associatoin in 1909.

SMILE AWHILE

DEDUCTION.

Margaret, aged seven, is sometimes very naughty. On one of those occasions her mother, desiring to be particularly impressive, said: "Don't you know that if you keep on doing naughty things your children will be naughty too.?"

Margaret cried triumphantly: "Oh, Mother, you gave yourself away."—Lafayette Lyre.

HIS PURPOSE.

The Minister—Although I disapprove of fighting, I was glad to see that you chose to fight on the weaker side. It was noble of you.

Casey, Jr.—Yeah, an' it made the fight last longer.

RESCUED.

First Sailor—I had an interesting experience at seamanship today. I came across a man floundering around in the water holding on to a keg.

Second Sailor—You effected a rescue, I suppose.

First Sailor—Well, yes; you see, I had to hit the fellow over the head with an oar, but I finally got the keg on board.

HAD HIS NUMBER.

It was on the overland limited and the conductor was perplexedly studying the slip of pasteboard that had been given him by a pompous appearing passenger.

"Where are you bound for, sir?" he asked.

"I am going to Los Angeles," returned the passenger, "although I must say that I do not see why I should be annoyed by questions, since you hold in your hand——"

"I know it," interrupted the railroad man, mildly, "but the ticket you have just handed me calls for a solid gold watch."

SIMPLE—ISN'T IT?

She—Why is it that at some times you seem so manly and at others so absolutely effeminate?

He—Heredity, I suppose.

She—Heredity?

He—Yes. You see, half of my ancestors were men and the other half were women.—Widow.

POTTED.

A shipwrecked mariner had just arrived on the cannibal island of Oompah, and was making some rather nervous inquiries.

"Was the last missionary you had here a good man?" he asked

"Pretty good," replied the chief, picking his teeth reflectively, "but the last time I saw him he was thoroughly stewed."

OVER THE BARNYARD FENCE.

"How many cows are ye milkin', Hi?"
Asked Henry Mudge, in passing by.
"I ain't a milkin' any, Hen;
But the Missus, she's a milkin' ten."

JEALOUS.

She—Mother saw you kiss me last night and she is very angry.

The Vain Male—Why, I'm nothing to your mother and she is nothing to me. In fact, I scarcely know her.

AND HE SAID ??-!*-!!!

Lady (calling the electric light plant)—The lights in my house have all gone out.

Superintendent—Yes, madam. A parrot got caught in the dynamo.

Lady—Oh, how shocking.

Superintendent—You'd have thought so if you'd heard what he said.

PETTERS' GRAMMAR.

"Two negations make an affirmation," declaimed Professor Dryasdust.

"Yup," agreed a youth from the rear row who was leaving school any way. "Like when a girl says 'Don't! Stop that!'"

EDITORIALS

NOT WORSE THAN OTHERS—Every once in a while someone indirectly connected with the canning industry writes us, or otherwise bursts out with: "What's the matter with the canners? Are they all fools? Haven't they any business ability? Can't they see through a ladder when their own interests are at stake?" and then they are much surprised when they find us hotly defending the canners, and picturing them as a whole lot better than a lot of other industries, taken as a whole. "Why, you've been roasting them about not supporting, in an active way, the Name on the Label Bill; about not joining heartily and actively in the fight to have restored the best bunch of canned foods distributors ever known, the big meat packers, and about planning to pack a lot of goods this season without any regard to quality, and of selling futures at prices which show hardly the remotest possibility for profit." And so we have, but that's our privilege. Remember, if you want to get into desperate trouble just attempt to interfere in a friendly scrap between a husband and wife or any family group. They may call each other names, but they won't allow anybody else to do it. And neither will we. Because we know the canners; know the problems they are forced to face, the troubles they have, and moreover because we know they are human. It is not just the little, inexperienced, lack-business canner at the crossroads who votes with the wholesalers to put the meat packers out of business; who sides with these same buyers to keep his name off the label and forfeits thereby all chance of building a name for himself, "good-will," which most business men prize above all things. Some of the biggest concerns in the business, splendid business organizations, with immense capital and many plants, are equally guilty, and are often the cause of the so-called little fellows doing as they do. When the biggest buyers in the country suddenly appear before a body of canners, as they did in Milwaukee two years ago, when the Consent Decree was under consideration in Washington, and ask those canners, "Are you going to support those big meat packers against us, because if you are we are done buying your goods?" it was wrong, it was cowardly, weak and totally lacking in moral courage not to stand squarely for what they knew was right; but it was human, because they were protecting their dollars, and whoever knew the dollar to have any moral courage or decency about it? And you can't point out an industry that has not done the same thing, or worse, under similar circumstances. The canners as an industry rank high for efficiency and business acumen. If the canners continue to gain in business ability as they are gaining today, they will soon revolutionize the selling of canned foods as much as they have revolutionized the production of the goods, and you must know that in production they are among the foremost industries of the world for progressiveness. In all the past years they have studied and developed the production feature of their business, until today they can afford to put it aside as accomplished and not requiring special attention any longer. It is in such shape that it will take care of itself, a lesson thoroughly learned. They have graduated from that school and are now taking an intensive course in business training, salesmanship and marketing; and if they show the same progress in this study as they did in the former, then we may reasonably look for a new era in canned foods. That is the one thing they need most now. They know how to produce the goods; they've learned the importance of quality packing, and all they require now is a proper balance through efficiency in marketing their products. The successful canner of the future will be the one with the best outlet for his goods. More canners today are marketing their goods just as other manufacturers are doing than ever before, and their number is large and growing. They will soon have that machinery perfected as they now have their production machinery, but in this case the canners must work out the perfecting; it cannot be made for them as was their canning machinery. It is an individual matter, and depends upon the individual. As in a school, he will get just what he takes out of it.

Given the factory, he must learn that the tremendous force of consumers cannot be won permanently, nor in these days even held momentarily, by

goods "packed just to get by;" that success comes only from the slow accumulation of public good will; that good-will can only be obtained and held by always satisfactory goods; that "bad news travels faster than good news," and that, therefore, one batch of poor goods may undo the work of a whole year or more. Having acquired these rudiments of successful business-building, his task is then to learn how to sell the goods as well, as intelligently, as he packs them. He will find this study not only interesting, filled with meaty revelations he never dreamed of, but profitable.

WE WERE SURPRISED—Mr. McGillivray, the Canadian canned foods director of their pure food law, said in his address before the Western Association, and reproduced in this issue, that he did not regard the producer's name on the label as of much consequence. We doubt if he could find a pure food authority, state or national, in the United States who would say that, or who believes it. The enemies of this proposed bill are lulling to sleep the industry by saying that such a requirement would only make trouble, with no resultant benefit to the consumer. Everybody knows better, of course, because it is the consuming public that is demanding it, not the canners or other manufacturers; the women's organizations, the buyers for the homes, the housewives who want to know who prepared the foods they feed to their families. These housewives know the evil of ufacturers are willing to be lulled to sleep—they don't hich dealers try to force on them. And they are just unreasoning enough to ask, "If they are just as good, why is the maker afraid to put his own name on them, instead of the dealer's?" The pure food men of America know that such a law would solve nearly all their problems. And that is just why a lot of manufacturers' products of the "just as good" articles want such a law. If they were proud of their goods they would be glad to place their names on them; and so far as foods, in particular, are concerned, there ought to be a law to make them proud of their goods, or not allow them to be sold. Is it of no benefit to the consumers? Well, if our lawmakers think so they should be relieved of their job.

New York City—Kutler Bros., at 136 Libert·· St. write that they have office and wharehouse in centre of food jobbing district of London and are anxious to take on representation of canners of fruits, vegetables and soups, dried fruit etc.

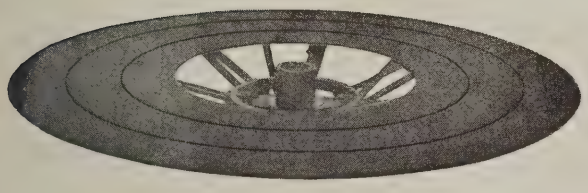
THE AMERICAN CHEMICAL SOCIETY MEETS

DURING the week of April 21st, Washington was the scene of the sixty-seventh meeting of the American Chemical Society. The attendance surpassed the record of all previous meetings, thus showing the wide-spread interest in the scientific topics discussed. Among the outstanding features were the open meeting address of R. A. Millikan and G. N. Lewis on the atom. Professor Millikan, who occupies the chair in Physics at the California Institute of Technology, has recently been awarded one of the Noble prizes in science.

Many subjects of both direct and indirect interest to the canner were discussed. Several papers dealing with insecticides were given; showing the efficacy of dusts and sprays of different composition. of their preparation and deterioration. Vitamins in canned apples and canned spinach were discussed by Edward F. Kohman and Walter H. Eddy. It was found in the course of experimental work that canned spinach ranks well with oranges and tomatoes as a potent source of vitamin C (the antiscorbutic vitamin). Furthermore, this vegetable gives evidence of containing more vitamin A, weight for weight, than butter which has always been regarded as one of the best possible sources. McHen··· and Powell in speaking of the effect of canning processes, showed that alkalinity has a deleterious effect upon color. In cases where hard water had been used for brine, the addition of small amounts of tarlane, malic or acetic acids proved highly beneficial in counteracting this tendency.

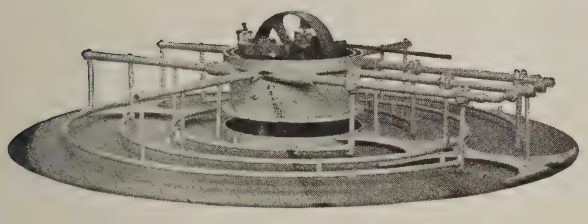
On Saturday April 26th, an inspection tour of Edgewood Arsenal was made. All of the facilities of the laboratories were shown the visitors and a field demonstration of Chemical Warfare Service and equipment brought the session to a close.

Youngstown, N. Y., is desirous of having someone locate a a canning factory there. It is right in the heart of the famous Niagara fruit belt district, with an abundance of peaches, pears, apples strawberries and cherries. The sail is also suitable for string beans and tomatoes. A good size, well equipped cold storage plant is in the village. The town is on an electric line which connects with the railroads.



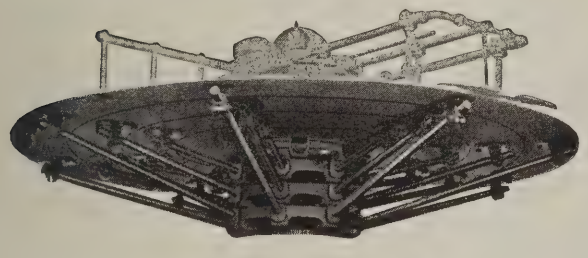
PEERLESS is the Solution of the Exhaust Problem

(Built in Twelve Sizes)



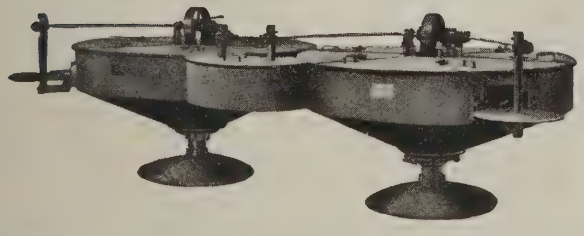
The New Peerless Exhauster

Peerless Exhausters are designed and built to utilize every heat unit in the steam with equal distribution to all cans. Five minutes after starting the unit reaches the high temperature of 211° and holds it steadily.



Transfer Plates are Smooth and Beveled

No jams or spills in the Peerless! How could they occur with these smooth rings? No seams or ribs to catch the cans—absolutely nothing but the metal rings. The cans transfer by friction.



Steam Lines Work with Transfer Plates

These circular pipes shoot steam directly to both sides of the can, thus insuring ample heat with minimum steam consumption. The steam lines act in conjunction with the transfer plates to guide the cans through the exhauster. *You can change sizes in two minutes.*

This Mechanism Drives the Machine

There's nothing here to give trouble. It's absolutely fool-proof. There is *not a single adjustment* on the Peerless and the illustration shows why adjustments are not needed. All gears are machined to gauge and then mounted on the center column.

The Peerless Duplex Exhauster

Solves the problem of long exhausts so that products which are very slow to absorb heat will be really hot when discharged. This type of exhauster thoroughly heats enough cans per minute to keep a line really busy. If even greater capacity is desired the Peerless Exhauster built in Triplex will meet the most extreme requirements.

Western Canners Association Convenes

N. C. A. Sections, Corn, Peas and Tomatoes also Meet—Business Every Minute

Sherman Hotel, Chicago April 22-23-24, 1924

(*Continued from last Week.*)

PRESIDENT HILL: Chairman Stare has very kindly consented to deviate slightly from the printed program; inasmuch as we have a large attendance at this time I would like to have you hear the report of our secretary, which had to be omitted this morninig. We will hear the report of Secretary Lee, and then we will resume the program.

Report of Secretary Lee.

SECRETARY JOHN A. LEE (Chicago): A committee was appointed this morning to consider the report of the Secretary of the Western Canners Association as well as the President's Report, and to formulate resolutions, and that committee wants to act. Therefore, this opportunity has been asked of you because the report of the Secretary was essentially and necessarily deferred at the morning session.

It is my duty and pleasure to make report to you of the progress and financial condition of the Western Canners Association.

When I took charge of the office two years ago we had not quite two hundred members of the Association in thirteen States and quite a number of those had not paid their dues for a year or more and had lost interest in the Association.

The first year I succeeded in securing 104 new members. This year I have not done so well, but have secured 41 new members, and our membership now represents eighteen States.

At the last meeting I reported $824 cash in the bank. Today we have $1,532 cash in the bank and no liabilities except a few small bills for supplies in the course of payment.

I have by persistent work and persuasion succeeded in collecting most of the delinquent dues or securing the written resignation of those who could not be induced to pay, and I am pleased to report that we have about $2,125 uncollected dues for the year, 1924, which I consider at least 95 per cent good and collectible between now and January 1, 1925.

We have a membership in good standing of about 365. I have had my books, cash and accounts audited by Albert T. Bacon & Co., certified public accountants, Mr. Bacon being the chairman of our auditing committee, and the report of the committee will be presented to you at the proper time.

For a little more than a year I have issued once or twice a month a news letter or review to each of our members, in order to keep in touch with them, and to hold their interest. It has been kindly received by the trade papers and they have given its contents additional circulation by printing its items of general interest.

I want to thank the commercial papers that have been so generously co-operative, and to mention as many of them as I have space for in this brief report:

The Canner, Chicago, Ill.
The Canning Trade, Baltimore, Md.
The Canning Age, New York City.
The Western Canner & Packer, San Francisco, Calif.
The Journal of Commerce, New York City.
The New York Commercial, New York City.
The American Grocer, Chicago, Ill.
The International Grocer, Chicago, Ill.
The New England Grocer, Boston, Mass.
The Interstate Grocer. St. Louis, Mo.
The Michigan Tradesman, Grand Rapids, Mich.
The Grocery World, Philadelphia, Pa.
Facts and Figures, Jacksonville, Fla.
The National Grocers Bulletin, New York City.
The National Retail Grocers Bulletin, Kansas City, Mo.
The Progressive Grocer,, New York City,

and possibly a number of other excellent publications which I do not see regularly.

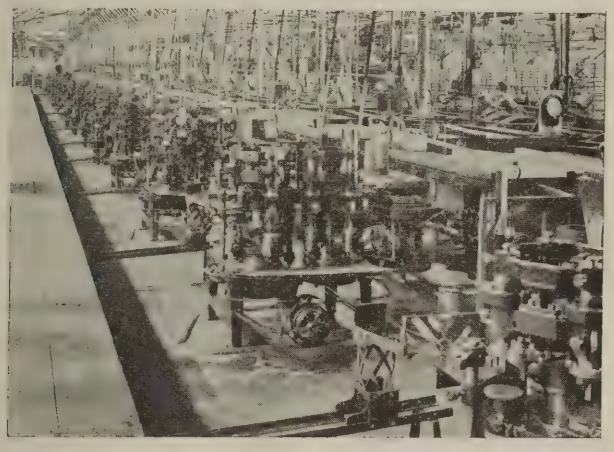
I would respectfully suggest, Mr. President, that under our constitution we are obliged to elect annually an entire list of officers and directors. There are none who hold over, and that this is drawn to the attention of our Nominating Committee, and I move you, sir, that this report of the Secretary and Treasurer of the Association be submitted to the committee appointed for its consideration.

PRESIDENT HILL: Gentlemen, you have heard the report of our Secretary and Treasurer, in which I am sure you are all interested. I might state for your information that I have kept in very close touch with the operation of our Secretary during the past year. He has been very faithful and efficient in his work. You haven't the slightest idea of the volume of work that has passed through that man's hands unless you have an opportunity of keeping in touch with him through correspondence as has been my privilege. If there are no objections this report will be referred to the Committee on the Secretary and Treasurer's report, composed of Mr. Virden, of Iowa; Mr. Cosgrove, of Minnesota, and Mr. Mitchell, of Illinois. I hear no objections and it is referred.

THE AMOUNT OF SWELLS.

CHAIRMAN STARE: I was hoping that Mr. Royal Clark would be able to get over from the Hotel La Salle to speak to us. I wanted him here in particular. I wanted him to make a brief statement of the proceedings of the last meeting of the Conference Committee, the result of which was that the question of accurate statistics on swell allowance was referred back to the several sections of the National Association.

As chairman of the Pea Section I have a letter from President Clark, asking for the collection of this information, and at that time I learned for the first time that ths section was without a secretary, the man who was elected at Buffalo, Mr. Olney, of the New York Canners, Inc., having found it impossible to serve. In that emergency I had to call for assistance upon a man who has always been willing and helpful, and so our friend, Mr. Nicholoy, was pressed into service as the secretary pro tem. At this time I would like to call for Mr. Nicholoy to come forward and tell us how well he succeded, and to present the figures that he did receive, after which I will then call upon Mr. Street, of New York, to give the New York figures, which have been returned on a different form and cannot very well be compiled with the others.



I sent out a questionnaire asking for reports covering five years, 1918, '19, '20, '21, and '22. The Wisconsin Canners have all had a report of this:

Year	Total Sales	Total Claims	Number Reporting	%
1918.....	$ 4,851,678	$5,210.35	38	.00107
1919.....	4,907,625	5,168.49	44	.00105
1920.....	7,618,431	5,407.57	51	.00072
1921.....	7,380,755	7,116.70	59	.00095
1922.....	10,609,315	7,832.76	61	.00074
Total....	$35,367,804	$30,735.87		.00086

Those were the most accurate records that we were able to get together out of the State of Wisconsin, and they are not truly representative of what our claims have been. They do include some swells allowances.

I want to say further that the reports compiled here are every report that I received. These came from some of our largest canners, and others of our largest canners did not have figures. They are not a selected list of canners that we picked out because of their efficiency in order to set up good figures. They are taken just as they came. The questionnaire was sent to every pea canner in the State of Wisconsin and we took the figures of every pea canner that reported, and this is the final result.

CHAIRMAN STARE: We have the figures also for Minnesota.

Year	Total Sales	Total Claims	Number Reporting	%
1918.....	$177,019.00	$51.31	1	.000289
1919.....	136,155.00	70.08	1	.000514
1920.....	249,099.00	146.63	1	.000588
1921.....	164,032.00	247.26	2	.0015
1922.....	300,203.00	395.18	3	.00131
Total..	$1,026,508.00	$910.46		.000887

I would like to have Mr. Street present the figures for New York state.

MR. JOHN STREET (Secretary, New York Canners Association, Rochester, N. Y.): I would like to ask one question. With your heading there, should not that decimal point in the first line be in front of the 1? You don't mean a thousandth of 1 per cent, do you? You mean a tenth of 1 per cent in that first item of .00107.

CHAIRMAN STARE: That should be a tenth of 1 per cent.

MR. STREET: To one that is as interested in co-operation as I am, I am rather embarrassed not to be able to make a very complete report from New York State. I presume that I am partially to blame, although I thought I was going to hasten things up by departing from Mr. Nicholoy's questionnaire a little. Instead of asking the canners to reveal to me in dollars and cents their actual sales, I am asked for a percentage basis. I thought it would be easier to get that information, but unfortunately to date I have only received replies from sixteen firms. That represents not quite a third of the firms packing peas in the state, and it represents an average pack of about 700,000 cases, which in turn is about a fourth of our maximum pack, probably about a third of the average pack. This is all in percentage basis.

A difficulty we had in New York which I had suspected was not maintained as strongly in Wisconsin is because of our diversified pack. If I understand the Wisconsin figures, you have a good many men who pack peas only. That is the exception in New York. I presume these men reporting have averaged from five to twenty items which they pack, and many of them do not keep segregated the claim allowances for the different items, which increasd our difficulty.

One canner, combining his peas with beans and corn for five years, had one-fortieth of one per cent; one with all vegetables, that is a full line of vegetables, one-tenth of one per cent. Another one with all vegetables, one-tenth of one per cent. Peas only, one-tenth, one-two hundredth, one-sixth, one-quarter, one-twelfth, one-fifteenth, one-twelfth, one-fourth, two-fifths, seven-hundredths, one-twentieth, and two reported that the claims were so small they kept no record.

The claim of two-fifths is certainly abnormal and represents the pack of a very small concern who is comparatively new in the pea-packing business, and I think in fairness they should not be considered at all.

These represent canners packing from about 10,000 cases to about 125,000 cases. Several of our largest packers are not included at all, but taking these figures as I have read them, and giving them all the same value, which, of course, is not fair, the average claim would be one-tenth of one per cent, which I am sure is a little too high, and yet you see it is not materially different from your figures, which are practically one-twelfth of one per cent.

I think I express the sentiment of the New York canners as far as I have discussed this matter with them, in saying that there is a very general feeling that an allowance of an eighth of one per cent would be exceedingly generous.

CHAIRMAN STARE: Is there anyone present who has figures that were to be turned in that have not been delivered by any other state?

We have a letter from Utah in which no figures could be given because sales allowances, swells, swell claims had all been included under one head, and the figure can only be approximate. We have one or two letters from other states in which the figures could not be used for any real comparison.

I presume all that is left for this ssection to do is to turn the figures over in their present somewhat incomplete form to the Conference Committee.

TO PUT QUALITY, SIZE AND VARIETY ON LABEL.

MR HUNT: To bring this matter before the house I would like to move that the Pea Section go on record as recommending that the quality be placed upon the label.

The motion was seconded by Mr. Mitchell, of Illinois.

CHAIRMAN STARE: It is moved and seconded that the Pea Section go on record.

MR. DENIGER: That, as I understand it, is in connection with the size.

MR. HUNT: That is in connection with the definition of grades brought before and sanctioned by this section if adopted by the National Association and in turn accepted by the Bureau of Chemistry. Of course, these grades could not be put upon the labels unless the others were accepted.

CHAIRMAN STARE: Does your motion also carry with it not only a declaration as to quality, but as to size?

MR. HUNT: Qualitv. size and variety.

CHAIRMAN STARE: Are we ready for the question?

The motion was carried.

The meeting adjourned at 5 o'clock.

MEETING OF THE CORN SECTION

WEDNESDAY MORNING SESSION

April 23, 1924

The meeting was called to order at ten-fifteen o'clock by President Hill.

Mr. E. B. Cosgrove, of Le Sueur, Minnesota, took the chair.

CHAIRMAN COSGROVE: I am going to call on Dr. Whiting, of the University of Wisconsin. I imagine that Dr. Whiting is better known to some of the pea canners than he is to the corn canners, but he is pretty well known to all the canning industry. Dr. Whiting will talk on "Soil Treatment and Crop Rotation in Relation to Sweet Corn."

GET NITROGEN INTO THE SOIL

DR. ALBERT I. WHITING: My advice is this: After observing the use of sweet clover for the growing of sweet corn by the large Illinois corn canners, and also after having had a good many years experience in connection with field corn, the proper procedure is to first start out and test your soil; if it needs lime, apply it, and then encourage the seeding of sweet clover and have it plowed under. It dosen't help so much to take it off of the land. It helps a little in a physical way, but it dos not add nitrogen to the soil and build up the soil in nitrogen, and there are but few soils in this country that are not benefited by applications of nitrogen in the form of organic manures. Have this sweet clover plowed down; encourage the growers to plow it under for the sweet corn. That emphasizes again the advantage of a crop rotation, because by using a legume that is not bothered much by insects and plant diseases in a good rotation you tend to get away from the diseases of sweet corn and the crops that you are interested in. In other words, crop rotation must be practiced in the canning industry more in the future than it has been in the past, ever so much so. Without crop rotation you intensify the diseases and insect troubles of all kinds.

In closing, I simply want to re-emphasize that you won't go wrong if you add limestone to your soil and establish legumes in the crop rotation, plowing the legumes under for the corn crop. It is the best method of approach to the problem of quality and the maintaining of qualitv in the industrv. both with the sweet corn and also with the peas.

Maybe there will be a number of questions, and if so I will be glad to answer them.

MR. F. W. DOUTHITT (Big Stone, Minn.): When is the sweet clover planted this spring for instance, plowed?

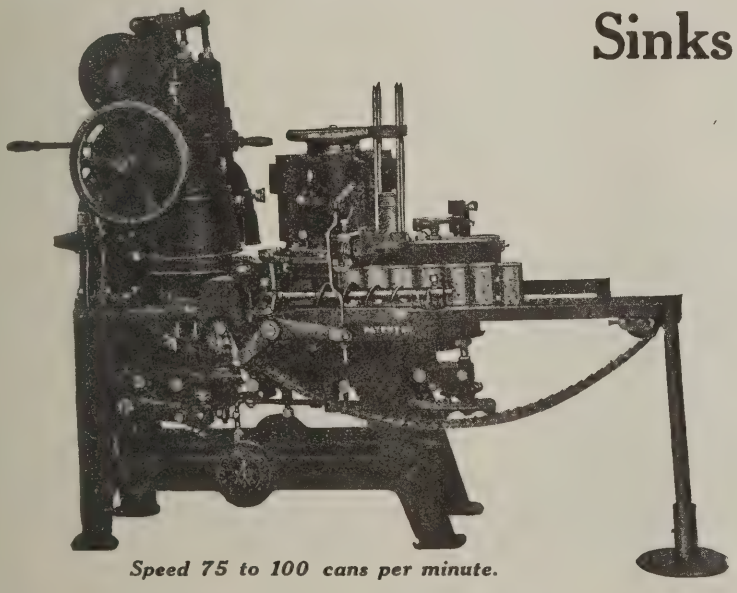
DR. WHITING: The sweet clover that is planted this spring will be plowed next spring. If sweet clover is seeded in grain and plowed next spring you don't lose the use of this land. It is used as a green manure. That is an economical system because you get your grain crop or pea crop this vear and then the sweet clover grows up in the fall and then grows up again in the spring and is plowed in a green condition in the spring. If you can devote a year to the improvement of soils, which you can hardly do, you could let the sweet clover crop mature or use soy beans on the land and plow them down for corn. Ordinarily we find it is difficult; you can afford to devote a year to the growing of a legume crop for soil improvement except in very poor sections, so this green manure crop fits into the rotation and doesn't take a whole season.

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.



Southern Can Company

Baltimore, - - Maryland

NEW YORK OFFICE: 17 Battery Place.

Manufacturer of newly developed "SOCOCAN" especially adapted for Coffee, Peanut Butter, Lard Substitutes, etc.
Write for samples and detailed information

It is the Small Unnoticed Leak that Sometimes Sinks the Great Ship.

Speed 75 to 100 cans per minute.

Slack seams are the major cause of swell loss. One half of one per cent some tell us, but sometimes it is much more.

A TROYER-FOY Non-Spill Closing Machine will eliminate any chance for slack seams, cutting down a big per cent of your loss. Two rolls for each seaming operation, the second operation rolls having a yielding pressure. Tight seams with no "cut overs" will keep the good ship of the canning industry floating safely on an even keel of prosperity.

DR. C. G. WOODBURY (National Canners' Ass'n., Washington, D. C.): I am sure a number here would be interested in a description of the size of the sweet clover crop that you had successfully plowed under in the spring.

DR. WHITING: We have been studying the sweet clover now for a good many years from the standpoint of its chemical composition throughout its whole life history of two years. Ordinarily we advise plowing sweet clover under when it is from fourteen to sixteen inches high in the spring. It will sometimes get higher than that before you can get to plow it. We have never experienced the difficulty of having it affected or the water cut off in the soil, where sweet clover has been plowed under, in the same manner that we have with red clover. In other words, the rate of decomposition of this sweet clover in the green condition is about like alfalfa. It is much like the red or the alsike clover. Oftentime, however, the sweet clover has b n plowed under when it is three or four feet high, even then w.th good results.

One thing I should have mentioned is that sweet clover should be plowed from seven days to fourteen days ahead of corn planting in order to give the initial stage of decomposition a chance to take place. The nitrogen that came out of the air goes into the sweet corn in the form of protein and other organic nitrogen compounds. Those compounds are not food for your corn plant. The nitrogen in those compounds must be changed through several stages. First it goes to ammonia. That is not for the corn plant. Then it goes to nitrite; that is not food, it is poisonous. Then the nitrite is further oxidized to nitrate or saltpeter. That is the form of food that the corn plant desires and also most other crops. That initial and those succeeding stages of decomposition occur rapidly with green material, slowly with dry material. It is the first stage or the ammonia production that we would like to get away from a little bit so it wouldn't injure the germinating seed. If you allow from seven to fourteen days there will never be any trouble.

MR. JOHNSON (Mount Pulaski, Ill.): Is it necessary to inoculate your seed if your land is sweet?

DR. WHITING: Yes. Unless the sweet clover has already been grown on the land it is desirable always to inoculate. It is always desirable to inoculate every legume because then you are not taking nitrogen out of your soil, you are taking largely nitrogen from the air. The improvement and enrichment of soils depends upon getting this nitrogen out of air and you will only do that when you have an inoculated legume. You can grow certain legumes on good soil without inoculation, but that is not the best procedure, the idea is to get the nitrogen out of the air. I figured here that you could get enough out of the air with the sweet clover crop to more than ocver the needs of the sweet corn crop. This expensive element, in other words, you are getting practically for nothing.

MR. MITCHELL (Dickenson & Co., Eureka, Ill.): I understood you to say in your talk that you not only got greater amount of corn but better quality of corn, that is more tender kernels. How about the hull? Does it effect the hull?

DR. WHITING: I couldn't answer that question exactly. The point that I was making was that nitrogen is the most desirable element in the rapidity of the growth of the young plant. Ample nitrogen feeding tends to keep the plant in a vegetated condition. On the other hand, phosphorus tends to mature it. This program starts out largely on the basis of correcting the soil condition, from the standpoint of soil acidity by lime, and following up with legumes, because all the evidence that we have indicates that nitrogen is the element that is the most important from the standpoint of getting sweet corn in from the field before it matures too fast. After this system has been established and been in operation for a number of years as it already has by some of the Illinois canners, then the time will come perhaps when we will have to give some attention to potassium and phosphorus, and on most soils it will not come in the initial years.

MR. MITCHELL: One other question, that is the question of the green manure of the stalks. You spoke about the necessity of putting the stalks in the grain if you want to keep the nitrogen in them. Would you recommend plowing under green or wait until next spring?

DR. WHITING: There are certain fundamental laws that have always been established in the rate of decomposition of green manures, straw, and so forth. In every case the material that is plowed under green decomposes more completely and more rapidly and it would be much better to get the stalks plowed under while they are green if you could than to let them mature because of the fact that there is a good deal of nitrogen left in the stalks and that nitrogen will be more readily available the next year than if those stalks stay in the field and tend to mature and dry up. There is an affect on the bacteria of the soil which is very easily produced by adding either straw or highly nitrogenous material and the more carbonaceous the more we hold down our nitrogen production, while if we use legumes that are high in nitrogen we build up the nitrogen. Particularly is that true at the critical feeding point of the corn.

MR. MITCHELL: Has there been any bulletin published on that subject? I ask that because two years ago the question was asked us and we corresponded with the University of Illinois and the University of Wisconsin and were unable to get anything that looked to be definite information to give our growers.

DR. WHITING: There has been no bulletin published dealing exactly with that question of the condition of the material. There have been sections in various scientific articles that do deal with that explicitly. However, the statement I just made is based upon a good deal of scientific work we have done and there seems to be no variation from the law that green material, no matter what it is, will go to pieces faster.

MR. F. HALL WRIGHTSON (Secy., Corn Section, Nat'l. Canners' Ass'n., Maryland): Is it too late to plant sweet clover in the last cultivation of sweet corn?

DR. WHITING: I can't cover all these things in this brief time, but I am glad you brought that up. No, it isn't. In sweet corn a good many times a very successful stand of sweet clover can be obtained, seeding the sweet clover at the last cultivation of sweet corn. In field corn it doesn't work as well because the field corn produces larger stalks and shades the ground and the crop doesn't get started as well, but that has been tried with quite a bit of success and it is worth a gamble in cases where there is apt to be moisture enough to start the crop off and it doesn't seem to interfere at all with the growth of the corn because the corn is past the stage where the sweet clover can get big enough to rob it of moisture or anything else. That is a good method for men that are growing corn on leased land or owned land where they are canning only corn—to introduce the sweet clover into the sweet corn at the last cultivation. The cost of the seed and the conditions under which that is done will warrant it as an example because if the weather becomes bad you won't get very much out of it, but a bushel of seed covers five or six acres and it is not very expensive. If it does grow it will be a good help.

CHAIRMAN COSGROVE: Do you get a good deal of fall pasturage off of sweet clover?

DR. WHITING: Yes, that is one point I had not touched on.

I would like to emphasize that the first thing to do is to plow it under and improve the soil first. After that system has been established on a given field and some of the conditions that many of you are operating under, it is all right to pasture that sweet clover. Where sweet clover is seeded in canning peas they often have a pasture the first week in August and it is very good for men that have fat cattle. They get a good cheap pasture for about a month.

CHAIRMAN COSGROVE: The growth that you plow under is the growth that is made the following spring, is it?

DR. WHITING: Exactly. In the fall it will grow from a foot to three feet high and then in the spring it will grow up again. Sometimes the spring growth may not be very high by the time you have to plow, but remember that food is still there in the plant, it is in the root. The roots are very rich, and they are also rich in soluble elements. If you take the roots of sweet clover and grind them up, eighty-six per cent of the nitrogen in the root is in a soluble condition, that means it has passed on rapidly to the sweet corn crop. There is nothing that we know of that will warrant your attention as much as the introduction of the nitrogen in the crop rotation, and green manure and plowing it under for the sweet corn.

CHAIRMAN COSGROVE: Dr. Schields, of Minnesota, is with us and he is going to talk to us on the work in Minnesota. We have a sort of partnership up there. We have a very high degree of co-operation with the food department. Dr. Schields is going to tell you a little about the laboratory work done by the food department for the canners in our state. (Applause)

INSPECTION AND LABORATORY WORK

DR. E. I. SCHIELDS: The subject of my talk is "An Inspection and Laboratory System and Its Work in Minnesota." It is only right and interesting to you that I take up the history

ROBERT A. SINDALL, *President-Treasurer* HARRY R. STANSBURY, *Vice-President*

of the inspection system in Minnesota as it was started seventeen years ago. At that time the canners in the factories in Minnesota were very unsanitary, a very inefficient group of factories. The total output of the state showed hardly a single can of fancy corn, and over three-quarters of the state output at that time was a sub-standtard product. Since then the improvement of the quality of the pack has been very marked. This improvement was due to, perhaps, to three factors: The chief factor, of course, is directly in the canners themselves. When they started out in 1903, the canners were a very inexperienced group of men and their experience through the years alone was enough to put the state on the map in the matter of packing a very fancy grade of corn.

Another factor that has helped that condition is the improvement of the inspected system under the state Dairy and Food Commission. At first the inspection was done by one man, Mr. A. J. Anderson, who still is chief inspector of canneries. He was, during the canning season, allotted a few more men from the Dairy and Food Commission to inspect during the canning season.

Another factor that improved the state pack to a great extent was the improvement in the quality of seed. This started in a rather interesting way. Some of the canners, along with Mr. Anderson, went to the Dairy and Food Commission with this problem in their mind. They in turn formed a committee and went before the state legislature. The state appropriated a sum of money. This money was to be spent on the matter of improving the seed. They went then to the state agricultural school at the University of Minnesota and got the college to appoint a group of men, and these men were to have supervision of the growing and the breeding of the seed at the location of the diffierent factories. The factories in turn were to supply the plot of land and do the work under the supervision of that man appointed by the State Agricultural College. The result was that each canner was able to build up a seed that particularly fitted his own part of the state and those factories that did not see fit to keep on with this system now get their corn from one factory that is making it a part of their work to furnish the seed for the rest of the factories. On the other hand, many of the factories still follow this seed growing system, and some of the men have a very high quality of seed that is particularly adopted to heir own climate and soil.

The laboratory was established in 1919. It has been able to do its works by following out two separate lines of work. One is the perfection of the inspection system. This system is now based on a very sound, scientific foundation.

The other system is the matter of grading, and this grading has a tendency to unify the state pack. I might say that the laboratory has been very fortunate in each year of the last five years to obtain the same man for doing this grading work. Mr. Sorenson, along with Dr. Guidell, who has charge of the laboratory, has developted this part of the work to a very high degree, so that now the grading is done rapidly and efficiently and the canners are able to profit by the grading. I want to say that this matter of grading during the packing season is one that does not concern the Dairy and Food Commission as such. It is merely an attempt to aid the canners in their work and perhaps pick up factors in the finished product that they do not pick up themselves when they see only their own lot of corn.

The grading is one of experience. A can of very fancy standard corn is used as a standard. With this can all the other cans are compared.

The laboratory having perfected its two systems of work, namely, the inspection and the grading system to a certain degree, has branched out in different fields of work that interest the canners. They have done a certain amount of work on corn blight. They have also fitted out a portion of their laboratory for the study of different types of spoilage, and the advice that the laboratory has been able to give on this type of spoilage, and it is mainly that type caused by thermophilic bacteria, is very expensive to the canners because, as you know, the spoilage from one factory will perhaps be of a different type than from another factory, and the laboratory by serving such a few factories as we have, namely, twenty-six last year is able to treat the problem of each factory in an individual manner. This, I think, is very important and the benefit derived from advice of this kind is great.

Last year the laboratory took up a new field of work, and this was the determination of the starch and sugar content in the canned corn. The laboratory now stands ready to recommend the best possible amount of starch and sugar that should go into a can of corn when it is finished and ready for market in order to give the best consistency and the flavor that is considered best in the laboratory.

To take up the matter of starch work, at the various meetings of the Minnesota canners it was generally agreed that perhaps the biggest factor of variance in the state pack as it now stands is the matter of consistency. In 1922 two full-time chemists were employed who attempted to work out the starch content of a can of corn by an old standard iodine method. This method, however, was unsatisfactory in that two samples would not check, and likewise they could not get checks upon samples. Another factor that was very important was the fact that they could not get these analyses out until perhaps twelve or twenty-four hours later, and this, of course, was too late to be of any practical value.

During the next season, or 1923, a new method was devised. By this new and rapid method the quantitative starch determination can be made upon a can of corn in exactly thirty minutes' time.

To go into the real part of this work. the average that we established for a very fancy can of Minnesota Crosby corn was starch six per cent. I might say that this sheet says that a fancy can grades between ninety-two and a hundred, but the average that we have established is even a better average and we have taken those cans of corn that average between one hundred and ninety-five inclusive, so the average we have established is upon the very fanciest corn that we ever got into the laboratory.

The amount of sugar that we found as an average was 3.48 per cent. This sugar value is one that is very interesting. It varies a great deal, as I said before, and we found the average for the season for certain factories to be as low as 2.9 per cent and to go as high as 4.2 per cent.

A certain amount of the corn, twenty grammes of corn, was weighed out each day and desiccated and the moisture thus was driven off. We found the amount of dry material in these 325 cans of desirable nature was 22 per cent. Therefore, you have 22 per cent dry material with 78 per cent water. Six per cent of that is starch and 3.48 per cent sugar. The rest is crude fiber, protein, and such like that goes into the formation of a can of corn.

If this was all we were to do the work would not have been very satisfactory. In checking up our work we found many things of interest.

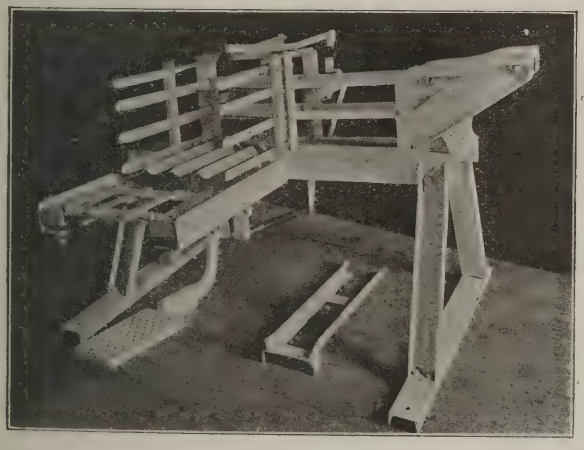
I might say that when we started this work we hoped to be able to establish a starch value for fancy, extra standard and standard corn. We were able to find a difference. That is the starch value of a standard can of corn is going to be higher than of a fancy corn, but the difference is so slight that it can not be detected by the ordinary starch method of determination that we have. But we did find some factors that were very interesting.

One thing is that starch very ordinarily is considered to be directly proportional with the maturity of an ear of corn. That is true, but it is not of such nature that it can be detected by the ordinary methods of scoring that we have used here. For instance, we would find a can of corn to receive 8 per cent starch and 5 per cent starch. Mr. Sorenson in grading that same can of corn had perhaps given these cans of corn each twenty on consistency but he had given them maturity figures like this; this can would have twenty-five or a perfect score on maturity and this can woud be scored down to eighteen, enough difference to put it into an extra standard grade when really it was a fancy can of corn.

Due to an extra ripening process the hulls on the corn are changed. By having a prolonged dry season during the ripening process the kernel of corn is going to be different than when the weather is perfect.

This factor instead of reading maturity should read toughness of the hull, and that change is going to be made on the scoring sheet next year. Perhaps that is the only change we will make on the scoring sheet.

MR. E. W. VIRDEN: I would like to ask weather it is desirable to add starch when the starch content is low.



DR. SCHIELDS: I can say that it might be desirable to add corn starch, but the canners in Minnesota are prevented from doing so by the dairy and food laws. The labels must state exactly what is in the can of corn and the Dairy and Food Commission say that all that shall be in the corn is sugar, salt and natural corn, so the adding of starch would be a desirable factor providing the sale would not be prohibited by laws. For no reason should corn starch be detected in the finished product, and corn starch is corn starch no matter whether it is added directly as such or whether it is already in the corn. The ordinary ear of corn in the canning stage has enough starch in it to give the right consistency if the correct technique is used.

Swells Allowance

CHAIRMAN COSGROVE: One thing that has been agitating all of us is the question of the swells allowance. We have with us the Chairman of the Conference Committee of the National Canners' Association. Mr. Sears will tell you just what has taken place in the horse-trading back and forth between the Jobbing Association and the Canners.

I want to say right here that the principle is bad whether it is big or little flat allowance. The smaller it is, of course the less is the inducement for inefficiency or rascality. The larger the allowance the wider the door is open for inefficiency. I have used too strong a term there in the word rascality. It would look pretty bad in print. I am sorry to say it appears that way to me. I think most of it is inefficiency, however.

The man who is at the head of one of the largest chain store organizations in his plea to me at Baltimore to try and settle this thing, said he thought it was time some conclusion was arrived at.

I said, "I don't know. We think there are other ways of solving the problem if we can get the cooperation of the distributor and the manufacturer. It is too much. You must modify your position."

"Too much," he said, " why it doesn't cover our losses now. It used to, but it doesn't begin to cover our losses."

"My friend, that is just the logic that we have been presenting to you people and trying to impress upon you, that if a half of one per cent was enough and too much five years ago, it is enough now, and five years from now you will be asking for one per cent and a little later you will say it won't be enough to cover your losses. You are opening the door to inefficiency and carelessness and maybe to something else stronger than that."

Your committee spent a lot of time and it required a lot of patience on both sides to discuss this matter and keep discussing it without much change of attitude on either side, although we usually quit our discussions in an amicable frame of mind, shook hands and said we would try it again some other day.

It has gone along in one phase or another until the last meeting that I knew of, which I was not able to attend on account of pressing business engagements, was held in New York in February. At that conference your committee was able to line up with the chain store organizations on the same basis as the wholesale grocers. The chain stores were very determined to have five per cent. They finally agreed with the wholesale grocers to go along with them on the basis of a sliding scale on the different commodities. The maximum was one per cent on certain kinds of fruits, a half of one per cent on a certain variety of vegetables, and a quarter of one per cent on the favored or preferred class.

CHAIRMAN COSGROVE: My impression was that at the meeting you had in New York the figure arrived at was a tentative figure subject to correction.

MR. SEARS: Yes, that was with the understanding that as time went on and we were able to produce more perfect goods and the spoilage allowance or this flat allowance was more than sufficient to cover losses, the percentage should be decreased.

That is all right, but they are starting the wrong way. If they had started at the lowest possible minimum of efficiency they never would have had to raise it, in my judgment, because it would have met the qualifications and of course we would never have had to reduce it unless we got to the point where the canners would say that canned foods like any other merchandise must be commercially perfect and that commercial perfection. If canned foods are 99.9 per cent perfect that is permade in this world is there a hundred per cent efficiency or perfection. If canned foods are 99. per cent perfect that is perfection. It is the experience of a great many canners in this country that one-tenth of one per cent should cover spoilage on a large line of vegetables. Anything larger than that means inefficiency.

I saw a letter from Dr. Elwell, who had been working very persistently in the past two years on tin-plate, and he indicated a very happy improvement in the quality of tin-plate being manufactured this year, for example. I don't know where he got his information from; I hope it is true. He also indicated that he had by selecting and assorting his cans, principally in the covers where the defects were found, reduced his spoilage on canned foods over fifty per cent. He had cut it in two this past year. He referred to the spoilage according to his own experience in his trade in a period of five years, and he had cut that five years' average in the middle by assorting and inspecting the entire quantity of cans that he had used the past year. It must have been some job because they use a lot of cans.

I believe that covers the report, Mr. Chairman. Are there any questions I can answer?

MR. DOUTHITT: Did the committee make it compulsory on the canners to accept the recommendation?

MR. SEARS: I presume that will come back to your Board of Directors of the National Canners' Association, to the Western Canners' Association, or to the open body and be acted upon to get the general views of the Association or the organization on the subject. It was the very best that I could be done at that time. They thought it was better to line up all the distributors on some uniform basis and get them to work together than to leave the thing open with some distributors, asking and demanding a half of one per cent on certain things and others taking what they could get.

CHAIRMAN COSGROVE: If this is in line with the thought of your conference committee we would like to have Mr. Wrightson now present the Corn Canners with the statistics.

I presume all of you men know Mr. F. Hall Wrightson, of Easton, Md., who is the Secretary of the Corn Section of the National Canners' Association.

REPORT ON STATISTICS OF ACTUAL CORN SPOILAGE.

The National Canners Association in March sent to its members who were corn packers, a request for statistics showing the amount of swell claims on corn which each firm had paid to buyers, and the percentage of these claims to their total sales.

The returns which came in from this questionnaire could have been a whole lot larger than they were. However, I believe that they are large enough to date to be both representative and enlightening.

There are certain phases which a report cannot cover which it would seem should be discussed. One is the possibility of some swell losses never being claimed by retailers, and another is possible unjust claims for goods which are not actual swell, but which have been mistakenly judged as such by retailers. How nearly these might offset one another is, of course, a question hard to solve.

MARYLAND

	Total Sales Reporting	Total Claims	No. Reporting	Percentage
1919....	$ 82,146.00	$225.30	1	.00274 or 1-4 %
1920....	156,020.00	82.82	3	.000531 or 1-20%
1922....	174,190.00	57.37	3	.000329 or 1-30%
1919 to 1923....	456,056.00	865.59	5	.00189 or 1-5 %
	$868,412.00	$1,231.08	12	.00141 or 1-7 %

One packer from Maryland reports corn swell claims for past four years average 1-10 of 1 per cent., but gives no statistics.

MINNESOTA

	Total Sales Reporting	Total Claims	No. Reporting	Percentage
1918....	$422,842.00	$1,056.02	3	.00249 or 1-4 %
1919....	397,643.00	250.42	4	.000629 or 1-16%
1920....	825,190.00	415.30	7	.000503 or 1-20%
1921....	553,303.00	321.37	7	.000580 or 1-17%
1922....	630,517.00	513.93	8	.000815 or 1-12%
	$2,829,495.00	$2,557.04	29	.000903 or 1-11%

WISCONSIN

	Total Sales Reporting	Total Claims	No. Reporting	Percentage
1918....	$259,570.00	$158.97	10	.00061 or 1-16%
1919....	343,128.00	322.51	12	.00094 or 1-11%
1920....	423,207.00	333.41	13	.00078 or 1-13%
1921....	377,855.00	662.34	15	.00175 or 1-6 %
1922....	591,438.00	789.34	16	.00133 or 1-7 %
	$1,995,198.00	$2,260.57	66	.00113 or 1-9 %
	$5,693,105.00	$6,054.69	107	.001063

This report so far shows a total of 1107 packers reporting total sales of $5,693,105.00 with claims for swells of $6,054.69 or between one-ninth and one-tenth of one per cent.

Automatic Strip Feed Presses

One of the most important and essential operations to be considered in making cans is the automatic production of the ends.

To meet the requirements for this very particular operation, we call especial attention to our No. 31 E. Automatic Strip Feed Press, such as shown.

Adjustable for all dies up to and including 6'', either round or square. The press is furnished with change gears for handling 3 to 20 cuts per strip and simple means to accommodate variations in length.

Feed mechanism is automatic, fool-proof and eliminates dangerous hand feeding. Operated in connection with our Presses, we supply Curling Machines and all other automatic can making machinery.

McDONALD MACHINE CO.

MAINE

	Firms Reporting	Percentage.
1919.....	5	.001163 or about 1-9 of 1%
1920.....	6	.000919 or about 1-11 of 1%
1921.....	7	.001106 or about 1-9 of 1%
1922.....	9	.00547 or about 1-19 of 1%

This is a total of 27 packs reporting from Maine, and if based on equal size the average percentages of corn swell claims reported from Maine would be .000882 or about 1-11 of 1%.

ILLINOIS

Reports from 10 packs from Illinois show the percentage of corn swell claims to be .0006865 or about 1-14 of 1%. One Illinois packer reports corn swell claims for a number of years back average 1-20 of 1 per cent., but gives no yearly data.

You will notice that from Maine and Illinois this report gives the number of firms reporting for each year and their percentages of swell claims, but no figures in dollars and cents. New York State also reports an average of 1-14 of 1 per cent. from ten packs, amounting to 200,000 cases. Assuming that these individual packs will average about the same size as those for which we have the amounts of actual sales, the total sales covered by this report would amount to around nine or ten million dollars and the total percentage of swell claims on this amount would average less than one-tenth of 1 per cent.

PRESIDENT HILL: I see no report from Iowa but upon an investigation made by the factories with which I am associated, composing about seven plants, our loss was one-fourteenth of one per cent. I do not recall what year that was figured on, but I know that was the loss reported by Mr. Stewart.

MR. ARTHUR HAMILTON (Lebanaon, Ohio): I have the report from Ohio, and from the figures we have in, perhaps twenty of them in the state of Ohio would figure approximately one-twentieth of one per cent.

CHAIRMAN COSGROVE: It is unfortunate that this information is not a little more complete. You don't apperciate the inertia that you run into when you try to gather this information.

MR. C. L. AUSTIN (Des Moines, Ia.): I have collected about twenty reports that average along about like those, or about one-tenth of one per cent.

CHAIRMAN COSGROVE: This is an open question and I think in fairness to ourselves and the grocers we have to accumulate more information and really get this swell allowance at approximately a fair figure.

You gentlemen of the meeting have the information before you now. What is your pleasure? Do you wish to refer this to the Conference Committee for their information and guidance and go home intending to give the Secretary of the National Canners Association further data? Is the Association content with the quarter of one per cent that has been adopted tentatively?

MR. MITCHELL (Illinois): One detail that I think would probably enter into all the figures (I know it did in our figures) is this: We made our report just as specified there, but for a good many years we insisted on the goods being returned to us and when they were returned to us we examined them. I know for some little time the goods examined were very largely way outside of the guarantee, that is, way outside of a year. Our guarantee had always been a year. For several years the amount of goods inside of the guarantee was less than twenty per cent. of those that we allowed, but still when we reported this loss we when we reported this loss we reported the total dollars that we had paid out, whereas if we had been reporting on the basis of the Committee's argument we should have reported a considerably less sum. I wonder if the experience is not common to to other people, too. We have had goods returned that are over seven years old and allowed the claim. The amount was small, of course. but still in the total there would have been quite a change in the figures, I think.

CHAIRMAN COSGROVE: I have heard some criticism that there was a lack of definiteness in the questionnaire that was sent out.

Mr. Sears, what do you want this body to do, pass the buck to you, or do you want some sort of commitment from them?

MR. SEARS: I think this Committee is like the fellow in the police court. We are not looking for justice, we want to get away as easy as we can. We haven't any egotism about doing a very good job, but if this Western Association will be kind enough to say that it is as good a job as could be done at the time and they will try it out, it might stabilize things a little, it might kind of keep the old ship in course and might keep things from getting worse. Let the Association sanction what has been done, with the understanding, of course, that if they pack goods better and with less and less spoilage, they will have reductions in proper time. I am not sure what action this Association should take. I happen to be a member of both the National Conference Committee and the Western, at least I was during a good part of these negotiations. I don't know whether I am yet or not.

CHAIRMAN COSGROVE: I think it is generally conceded that every one in the industry appreciates the work of the Conference Committee in arriving at this tentative settlement for this year's pack, or at least it is a starting point and I imagine a great many contracts have been rewritten for this year with the one-quarter of one per cent included.

What I am interested in personally is knowing whether the canning industry is satisfied with the quarter of one per cent. It is possible that you have gone far enough.

MR. SEARS: It just occured to me that the report might be received and referred back to the Committee, or something like that.

CHAIRMAN COSGROVE: You mean Mr. Wrightson's report.

MR. SEARS: Yes, and also the report that I have just made in behalf of the Conference Committee. It could be referred back for further negotiations if you don't feel like approving it and accepting it tentatively.

DR. T. O. GOERES (Lodi, Wis.): I think there is no question, but what we appreciate the work the Conference Committee has done. There is no question about that, but I think it would be more impressive if we would go on record as not being willing to agree to one-fourth of one per cent. Then the Conference Committee can say to their people that our canners do not sanction it, they think it is too much. If we sanction one-fourth of one per cent, the other fellows will say, "Why should you worry if your canners agreed to it? They think it is all right."

CHAIRMAN COSGROVE: Your thought is that we make a motion referring this to the Conference Committee for further negotiations.

DR. GOERES: That is the way I personally feel, but I don't want theCommittee to feel that we don't appreciate their work.

MR. SEARS: As long as we draw the salaries we don't care much what you think about us.

DR. GOERES: I will make that a motion.

CHAIRMAN COSGROVE: The motion is that this additional information be referred to the Conference Committee for further negotiation.

The motion was seconded by Mr. Farmer, of Iowa.

MR. WITMER: I would like to amend that motion. I think you find as a rule that the majority of the wholesale grocers will acknowledge that the swells in the canned corn don't exceed one-eighth of one per cent, but they take the position that very few of the jobbers turn in more than half of the swells that they themselves are charged with.

I feel that one-half of one per cent, which is the request the jobbers made on the canners, is at least twice as much as the legitimate claim would be if they turned all of them in to the canner.

I believe that inasmuch as they won't average over one-eighth of one per cent of those turned in, if you take into consideration the swells that the jobbers are liable for, it would be in order to amend this motion to make recommendaiton to our Conference Committee that they agree with the Conference Committee jobbers on one-quarter of one per cent as the allowance in lieu of swells on canned corn. I think that would be satisfactory to the jobbers and would be more nearly fair than any other figure that we could make. I would like to amend the motion to that effect. I think it would go through and be satisfactory. If there should happen to be any considerable quantity of swells to run up to several per cent, the jobbers naturally would have a further claim above that, but I am convinced that a quarter of one per cent will go through. Whether the Resolutions Committee thanks our Committee or not we will know they appreciate their efforts.

CHAIRMAN COSGROVE: I think technically your amendment is out of order because it reverses the original motion, but it puts the question fairly before the house. We

will entertain the amendment. Is there a second to the amendment? The amendment is that we approve the action of the Committee in naming one-quarter of one per cent. That commits this body to that approval. Is there a second to the amendment?

The amendment was not seconded.

CHAIRMAN COSGROVE: I think failing of a second that the feeling is that is too high an allowance.

MR. LANGMAN: I happen to be in a very peculiar position. I am not a member of the Canners Convention or the Canners Association but of the Machinery Division of the Canners Convention, and in talking to both wholesalers and the canners I find that neither side understands the solution or the suggestions that have been arrived at by the National Canners Association at the conference.

The cannners seems to be under the impression that they are compelled to accept the percentage allowance in selling their goods. Some of the wholesale grocers feel the same way about it and other don't, but I don't believe that the trade as a whole understand that the canner still has the advantage of selling his goods on the old guarantee basis or if he preferred on the percentage basis. In other words, the recommendation of the Association or of the Conference Committee was not compulsory to the canners except flat allowance. I really believe that it would clarify the situation considerably if the circular letter sent out by the National Canners Association dated February 18th were read, because it is a complete report and resume of the final solution of the problem as arrived at by the Conference Committee.

MR. WHITMER: I would like to say further in regard to that, that the Conference Committee present the proposition of one-quarter of one per cent and the time ought to be set when that takes effect, inasmuch as practically all the corn packers are nearly sewed up on future corn, we are not including that one-quarter or one-half of one per cent, and possibly the Conference Committee should agree that that per cent should take effect beginning with the 1925 pack.

CHAIRMAN COSGROVE: I think we have thrashed out thoroughly the thought that none of us in this meeting are in favor of a flat allowance of one-quarter of one per cent. That is the principle at any rate.

Is there any further discussion on the original motion? All those in favor of the motion to refer this to the Conference Committee say "aye"; contrary the same sign. It is carried.

DEFINITION OF STANDARDS

The next item is the Committee on Definitions and Standards for Canned Corn. Mr. Green can not be here. I understand that Committee has got to the state where they have arrived at a tentative definition for standard corn. That is the thing we are most vitally interested in, and Dr. Harrison is going to give us roughly the progress they have made along that line so far.

DR. HARRISON: I am rather a poor substitute for Mr. Green in this matter. The only interest I have in it is that about two years ago I started to work on this same problem for the Iowa-Nebraska Association. At the time Mr. Green took up this matter for the National Association, I conferred with him on it and turned over to him some of the data which I had gathered together.

There is practically nothing new in the matter that Mr. Green has except in the way of going about the matter of the definition. It has always been the custom, down through the various official bodies, to define a product and to eliminate everything else which is not covered by the definition. In other words, if we say that a product shall be red, if it is green it immediately does not comply with the definition.

A great many attempts have been made to define the minimum standards of corn along that line. and practically without exception they have failed. The thought was to combine that method of attack, and also to add to that, certain negatives which can be conveniently added in this particular case. The definition, I think, as it stands now, is somewhat along this line. I would not want to be quoted as to the exact phraseology because it has been two or three months since I have even read this.

> "Standard corn is a product to be prepared from fresh green corn packed agreeable to good cannery practice. (They add to that the following statement): "The following shall in themselves classify any lot of corn as below the grade of standard corn; corn which contains excessive quantities of husk, cob or silk; corn which is excessively thin in consistency; corn which is excessively thick or pasty in consistency; corn which in any one lot shows a marked variation in consistencies."

The question came up as to what shall constitute any one lot, but the thought was there that in any one shipment, if it happened to be a thousand cases, then there should be no marked variation in the consistency of that particular thousand cases. If the purchase was on a 5,000 case basis, then the 5,000 cases should not show a great or decided marked variation in consistency.

Also classed as substandard corn or corn below a quantity which would permit it to be graded as standard, corn which has become dented, corn which has become overmature in the fields, corn which has become heated or soured before packing, corn which is off flavor and lastly, the thing that has been a great bone of contention, corn which contains less than fifty pounds of sugar per hundred cases.

You will see that this method of definition defines the product of standard corn in probably as careful a language as it is possible to design for a brief definition, and then turns around and says that a large class of products shall not be standard corn for the following reasons.

The line of reasoning on that point was this: practically throughout the entire country the method of packing standard corn is essentially the same; practically the same type of huskers are used, and so on down through the various processes of packing the corn. We all know what our faults and failings are; we know that a great deal of substandard corn is produced by carelessness in getting the corn in from the field, carelessness in flavoring it, carelessness in trimming and inspection, and washing, and so forth. These additions were made to the definition for the purpose of specifically setting out and stating that corn which did have one or more of these failings should in itself classify the corn as being below the grade of standard.

CHAIRMAN COSGROVE: We have with us today Dr. D. N. Shoemaker, the horticulturists of the Bureau of Plant Industry, the U. S. Department of Agriculture, Washington, D. C. Dr. Shoemaker is going to talk to us on:

THE GENERAL SEED SITUATION

DR. D. N. SHOEMAKER: I shall first have something to say on the question of pea seeds. It is necessary possibly to say just a word on history there. It is interesting that we have had wrinkled peas for about 1800 years.

The Alaska pea is the one that makes the most trouble for the canner through the seedsman, so what I shall have to say on peas is plainly concerned with that variety. The Alaska pea was first brought into this country as the result of selection work done in England and it came in under the name of "Earliest peas of all." Mr. Cleveland, of Cape Vincent, New York, is the man who gave the name of Alaska, and often it went for a long time as Cleveland's Alaska.

Alaska is a smooth pea, quite a bit like a good many of the peas that are grown for field peas in the United States.

Alaska grown by a farmer without any selection will eventually turn out to be nearly all these long vined rogues with very few true canners' Alaskas, and yet what you get from an Alaska stock that has run away in that way and gone wild is not the same as Imperial or Blue Bell or any other green seeded field pea; it is earlier, and Alaska as a field pea is pretty widely known in the west. Prof. Tracey has told me that many years ago in the middle nineties when Wisconsin was still the seed pea center of the United States, seedsmen had a name for those wild Alaskas, they called them Wisconsin Alaskas, or Wisconsin Farmers' Alaskas, which meant simply a stock of Alaska which had been out of the seedmen's hands for a considerable period of time and had come to be very largely composed of the long rogues. That kind of Alaska is almost as bad for the canner as Blue Bells would be. I have seen crops of peas in Maryland that could hardly be anything else than that type of Alaska that would make vines as high as one's head and would have ripe pods on the bottom and blossoms on the top. They wouldn't stop growing, it makes the crop late, throws the harvest in the wheat harvest time, and in every way makes it difficult to make anything like a choice pack. You can buy seed in the market in the west which the farmers will call Alaska, which any jobber will call Alaska, and which you can't tell from Alaska by seed inspection; I know I can't, and I know I have that same opinion from a number of seedsmen who admit that they can not by seed inspection tell the difference between an Alasska which has gone almost entirely to offs and a real good stock.

We have been making some tests at Washington of Alaska pea seed as handled in the packing trade, so I have handled something like two or three hundred varieties of Alaska from

different seedsmen all over the country. The first year I went over the samples very carefully as they came in. I had a vial sample of each one made and had them all in front of me before they were planted. I said to myself, "There must be some difference here. I will go over them and pick out what look to me to be bad and put them in one box, and the ones that seem to be good Alaskas I will put in another box." I did, and I planted them. When the final results came I had to take about half of the bad box out and put it in the good box, and vice versa, so that I failed utterly in being able to tell which was going to turn out to be satisfactory by the seed. I think you would have the same experience. Therefore, it is possible for you to buy Alaska which seems to be absolutely good and which will not be in any way satisfactory. That leads to the exact statement that no jobber can handle Alaska peas.

Alaska pea seed for the canner is not a subject for jobbers' handling. They can not be bought by sample, they must be handled by the man who has known the crop in the field or who has hanlded the stock seed from which the crop was grown. They can't be handled as a jobbing proposition.

Worse than all that is an occurrence like this: In the early years of this century, about 1900, or very shortly afterwards, one of the men of the Department of Agriculture had a trip to the Orient. He was in the Philippines and came back by way of India. He got a number of different kinds of farm crops and brought them back for trial in this country. Among those farm crops were two sorts of peas from India. One is something grown under the name of Amraoti, a Hindu name. The other is called Bangalia, which is also a Hindu name. Bangalia is the only one of interest to canners. The only reason it is of interest to canners is because it is the earliest of all the field peas. It and the field type of Alaska are about of the same period of growth. Bangalia is not so early as a canner's Alaska, as true Alaska, but it is as early, and a little bit earlier than the wild Alaska which is grown west.

Some of those peas were shown to you yesterday. Dr. Woodbury had a sample here and you have a sample on the table. I went this morning to a seedsman and bought a packet of Alaska seed. I don't know whether those are good canners' Alaska or wild. I have taken of the Bangalia ten peas and put them in this sample of Alaska. Now I know that all of you could pick out some of them very, very readily, but I don't believe there is a canner here that could with ten minutes' examination of this sample pick out the ten peas of Bangalia that I put in here. Bangalia is a little bit smaller than Alaska, and that is one place that it does you a lot of harm because the peas, when run through the viner, sieve out into the higher price sieves.

I think you know the rest of the story of Bangalia being a purple flowered pea. When you process it, it blackens,, and more than that it blackens the liquor. If there are a comparatively few in your can of peas when it is opened out, especially the smaller size, they may look almost as black as ink. You do run some danger of getting Bangalias, but that is a minor danger to the danger of getting wild Alaskas. You can tell Bangalias by the sample of the seed, and a canner who is experienced should not buy seed with Bangalia in it. He ought to be able to see that. He can't tell when buying whether he is getting wild Alaska or not. That depends entirely on the relation between the canner and the seedsman.

This year we have had a number of germination tests made at Washington of samples of peas and corn. It would probably be well for me to tell you something of the seed laboratory at Washington and what they stand ready to do for a canner. The seed laboratory has none too large funds, of course, but it does stand ready to make a germination test for any one who sends in a sample. They only put this restriction on, that for one person they won't make more than ten germination tests per month, so, of course, if every canner and every canner's company in the whole country would send in ten every month, they probably would have to have a bigger appropriation. There is not much danger of that, perhaps, but they are glad to make these tests; up to the absolute limit of their funds they are very glad to have all of the things sent in that they can handle.

We had forty-seven samples sent in of peas. They were gathered for only a short time of I think three or four weeks. Those forty-seven sample averaged ninety-one and two-tenths per cent. germination. The worst sample of the whole lot I believe went down to sixty-six. That was only one.

At the same time, we had samples of corn asked for and we made two attempts at getting corn. A number of canners were invited to send in samples of their supplies of corn and and orders were made from corn seedsmen. The seed laboratory is very careful in buying its supplies of seed for germination tests. There are a number of things that they are empowered by law to go out into the market and purchase and make germination tests and publish the names of the folks who have seed of lowest or unsatisfactory germination. Their method of purchasing that is very carefully guarded, and they are purchased in a way so that the dealer has no way of knowing that this particular purchase is not an ordinary purchase from out in the country. That is pretty easy to do with packet seeds, of course. but not quite so easy to do when you are dealing with a wholesaler. It meant fairly large purchases at this time. They went over the corn seedsmen and sent in a number of orders. These orders turned out this way: there were thirty-nine of the corn seedsmen's samples and the average viability this year was 84 per cent. Those germination tests were just completed last night. Some of those went down as low as fifty-six, at least one did.

The canners sent in thirty-nine samples of corn. The average of the canners' samples was eighty-nine per cent. Altogether, all of the samples of corn that were handled were seventy-eight samples, and the average for the whole seventy-eight was eighty-seven per cent.

There has been quite a little trouble this year with getting both peas and corn, and I think there is apparently not much doubt that some of these wild Alaskas have been picked up by jobbers in the West and have been sold to canners. Of course, those are probably in the ground now and you won't know all you trouble until canning time comes if that has happened.

There isn't very much that can be done with the corn, of course, but those are the figures that were obtained from both the seedsmen and the canners' suppliers: Eighty-four per cent. out of thirty-nine tests from seedsmen and eighty-nine per cent out of thirty-nine tests from the canners.

Just a word as to some work that has been done at Washington within the last year on corn varieties. This was reported on by Dr. Magoon at the Buffalo Convention, so that I think many of you heard it and probably all of you have had an opportunity to read his paper in some of the canners' publications. The work has been very interesting. Drs. Magoon and Culpepper started out in co-operation with another office in our division to study the desirability of different varieties of corn for canning. After the first year's experience Dr. Magoon was very quick to say that he could always tell Golden Bantam corn, for instance. The second year it didn't turn out that way. The test then was planned on a quite extensive scale and planned very accurately for the third year. He secured I think close to twenty different varieties of corn. About half of them were white and half of them were yellow. They were planted all the same day. The canning process was exactly the same. He put in the same amount of sugar and salt in the liquor that went in with the corn. When the corn began to silk they got themselves a large supply of tags and every ear in this plot when the silk first appeared through the husk was tagged with the date. Then at intervals of five, ten, fifteen, twenty and twenty-five days they went into this patch and got first beginning as low as five days after the silk was begun, samples and took them in and analyzed them chemically and even tried to can that way. That gave them exact data on that particular pack. It meant a whole lot of work, of course, but they had then a pack that was all put up at exactly the same stage after flowering began. They had all of these cans at the best stage; fifteen and twenty days after flowering, I believe, was the time they found them to be best; they had them all opened and on the table and the whole office took opportunity to go by and make a test of them, and folks from outside were invited to come in. We could all, I think, after being blind-folded tell whether corn was white or yellow. Nearly all of us could do that, I think.

As between the different white corns and the different yellow corns, we didn't succeed in telling. If the corn is canned at just the right stage the product seemed to be about the same whether from one white corn or from another white corn or one yellow corn from another yellow corn.

Adjournment.

GENERAL SESSION OF THE WESTERN CANNERS ASSOCIATION

Wednesday Afternoon Session

April 23, 1924

The meeting was called to order at 2:15 o'clock by President Hill.

PRESIDENT HILL: Gentlemen, the members of the Western Canners Association are especially favored in having with us today our own Royal Clark, for so many years closely affiliated with this organization, but now President of the National Canners Association. Mr. Clark needs no introduction to the canners of this country. I now have the pleasure of presenting to you the President of the National Canners Association, Mr. Royal Clark. (Applause.)

President Clark made a ringing address, which will be published later, and Ex-Presidents of the N. C. A. were called on and made brief addresses.

PRESIDENT HILL: The next thing appearing on our program is "The Label, What Does It Stand For?" by Mr. W. Gillivray. He is Chief Canning Inspector of the Department of Agriculture, of Ottawa, Canada. This is the gentleman to whom I referred this morning, and I am sure that we are very glad to have him with us. (Applause.)

"The Label, What Does It Stand For?"

MR. C. S. McGILLIVRAY: When your Secretary honored me with an invitation to attend this Convention and to contribute a paper toward the program, it was with feelings of mingled pleasure and reluctance that I accepted.

I need not assure you of the pleasure it affords me to meet with the members of your great organization, many of whom I have met for years in the most pleasant relationship. At the same time I feel reluctant in imposing my ideas upon an audience, many of whom are, or should be, better qualified to speak upon any aspect of the canning industry.

My subject is "The Label, for What Does It Stand?" and at the outset I take it that you will all agree with me that it should be protective, ornamental and instructive. I will not dwell upon its usefulness as a protection to the package, nor upon its attractiveness in drawing attention to the package, but I do wish to consider with you for a few minutes its duties as well as its privileges in giving instruction to the buying public.

Its duty is to tell the essential truth about the contents of the package. Its privileges are to give information about said contents, which information is not inconsistent with the truth and which may be of benefit to the buyer or seller.

You may ask me what I mean by the "essential truth" rather than the truth, the whole truth and nothing but the truth, and my reply will be that it is possible at times to tell so much truth as to make negative the good points desired.

The essential truth, to my way of thinking, is an honest description of the contents of the package in legally defined terms of the trade, together with the name and address of the vendor who assumes responsibility for the correctness of said description.

There is considerable difference of opinion whether or not the name of the packer should appear upon the label. This, to my mind, is not nearly so important as some would have us think. If I were a packer I would hesitate a long time before I would put out any of my high-grade goods under a first dealer's label. I probably would not be so particular about my low-grade stock. My reason for this is that I would want all the advertising possible from my high-grade goods and as little as possible from such as I would not be proud to own.

On the other hand, if I were a dealer, I am sure I would much rather advertise my own brand, which through careful selection, judicious advertising, fair dealing and general business efficiency I had succeeded in placing on the most favorable markets of the country rather than to spend my energies in pushing the sale of some packer's brand without any assurance that I might be doing business with him the next month.

It may be desirable that the packer's name appear upon the label, but I fail to see where it is essential or where the consumer is benefitted so long as a reliable party assumes responsibility for the product and gives his name to the label as a guarantee therefor.

What I consider the essential truth is an honest description of the contents of the package in legally defined terms of the trade. You note I use the words "legally defined terms of the trade."

You will pardon me, I am sure, if in the remarks which are to follow I deal with the subject as I found it in Canada.

Our department collected thousands of samples of canned foods, and after a careful comparison of the contents of the packages with the statements on the labels of the same, we found that in many instances the contents did not by any means meet the glowing description on the label; indeed, it was not unusual to find the more glowing the description on the label, the poorer the contents of the package.

We gathered what information was available at the time and with it went into consultation with the packers and dealers. As a result, we decided on four grades or standards of quality and having agreed upon these, we selected four terms used by the trade, four suitable words to define these four grades. The words selected were Fancy, Choice, Standard and Seconds.

Followinig the selection of these descriptive words, we carefully defined the qualifications necessary for the food to meet the quality necessary for each descriptive word.

Having accomplished this, we then proceeded through a process of legislation to make these words and their description the legal and the only legal description for such foods as are or may hereafter be standardized.

But we did not stop there. Having legally defined the four grades or standards of quality, we required that the label should show to which of these grades the product belonged. We furthermore required that this declaration of grade should be shown on the main panel of the label, using the words "Fancy Quality," "Choice Quality," "Standard Quality," or "Second Quality," as the case might be, in type not less than three-eighths of an inch in height. We also required that the strength of syrup in fruits and the size of peas be declared in type not less than one-quarter of an inch in height.

It is our desire that the label shall tell the truth about the quality of the contents of the package; that is, the quality of the goods, the strength of the syrup and the size of the peas, so that the buyer has a reasonable chance to know what she should be getting, and also have some basis for legal action if she finds that the contents of the package does not meet with the quality claimed on the label.

At the Buffalo Convention I was discussing this matter with one of your largest packers on the Coast. He did not express himself as favorable to legally defined standards of quality; he believed that if the buyer was left to herself she would select only those brands of high reputation and reject those brands which were not proved to be strictly first class. He claimed that his own brand was nation-wide, known for superiority of quality, and he did not care to lose the benefit of the thousands of dollars which his firm had spent in advertising the superiority of his product, which benefit he considered he would lose if the Government established a legal standard, and allow his competitor, who possibly did no advertising, to claim legally on his label a quality as good as he, the advertiser, would be permitted to claim on his.

I pointed out to him that from careful observation made in Canada we had found that declaration of quality on the label had benefited rather than injured the business of highly advertised products of a really first-class quality, but had a restrictive action on the sales of goods of inferior quality, but offered for sale as "equal to the best in the market."

Strange to say, the afternoon of the same day on which I was talking to the packer just referred to, I was looking around a grocery in Buffalo when I overheard a customer giving an order for canned peaches. She said to the grocer: "I see Brand" (naming the brand of the packer just referred to) "is advertised as the finest goods. Do you keep that brand?"

The grocer replied: "Yes, we keep that brand and will be glad to furnish goods under that brand to you, but let me tell you something. While no one can question the quality of the goods under that brand, you can scarcely pick up a magazine in this country in which that brand is not advertised, let alone the advertisements on thousands of billboards and in street cars throughout the whole land, and someone has to pay for that advertising. Now, we have a line of peaches on which we put our own label; they were specially selected by us, and we have put the money in the quality of the goods instead of in advertising."

He sold his private brand of peaches to his customer; he also sold a can to me. I had examined thousands of samples of various products put out by the packer of the highly advertised brand, and in 95 per cent or more instances I had found them to be "Fancy Quality." I was curious to see the quality of the goods which had advertising cost put into the goods.

Leaving the grocery I went into the Convention Hall, where I met a processor whom I have known for the past fifteen years. He is what you might call a "traveling processor"; that is, he never spends more than one or two seasons with any one firm. Since I have known him he has been alternating between New

York State factories and Ontario factories. He spied the can of peaches I had and asked me where I got it. I told him. He replied: "Oh, I know all about them. We packed the goods for that firm this year, put them under their own private label, you know."

I remarked: "They are strictly high-class goods, I suppose?"

He replied: "Oh, no, they are only standard quality, and none too good at that; that firm does not know good canned foods when they see them."

I leave it to you if this was not an instance where a gross injustice was done not only to the consumer, but to the packer of high-quality goods and to the canning industry in general.

Legal standards, whether they are State, Provincial or Federal, are most desirable, but they are of little actual value unless they are declared upon the label.

Legal standards without declaration on the label may be of some value in dealings between the canner and the jobber, or between the jobber and the retailer, but they are of value there only inasmuch as the dealings between these parties are by written contract, but as between the retailer and the consumer, who is, after all, the most vitally interested party, there is only the verbal declaration of the clerk behind the counter, and he may be wise and just, or ignorant, or dishonest.

In the instance which I have just cited there could easily have been ten cents a can difference in the cost to the grocer for the goods which he offered, but instead of his customer getting the benefit of this difference, or getting what she paid for, she received a product which disgusted her with canned foods in general and not necessarily the brand she received in particular.

Now, gentlemen, I submit that had the quality of the peaches for which she asked been legally defined, and had that quality been declared on the label, the clerk would have had difficulty in convincing her that standard quality of peaches (even with the price of advertising thrown in with the goods) were as good as fancy quality of peaches, even if a lot of money had been spent in advertising the same.

There is a statement of truth many claim should be shown on the label, one I do not consider an "essential truth," and to my mind the telling of which would be an error of judgment. I refer to the declaration of date of packing.

I can scarcely understand how anyone who really knows anything about the canning industry could let this claim be set forth without challenging it.

If canned foods were like wine, improved with age, or like some drugs, deteriorated with age, there might be something to commend such a claim, but they are not. There is scarcely a variety of fruit or vegetable which, if properly packed, deteriorates with age. I am sure you will all agree with me that from your own experience carefully selected, properly processed and intelligently stored canned foods are found to be in better condition six years after packing than are carelessly selected, improperly processed and neglectfully stored goods of the same variety six months after packing. I might say here that the best can of corn which I tasted in 1923 was packed in 1898, twenty-five years old.

A considerable portion of the population of the North American Continent is strongly prejudiced against canned foods. This prejudice is caused partly by ignorance concerning their value and partly through unsatisfactory experience which they have had in buying what was expected to be the first-class article, but which proved to be "slush."

The best way to overcome this prejudice is to send a special messenger to the buying public with a message of truth about the products which you are manufacturing; and, to my mind, the best messenger you can select to carry this message is the one which accompanies every package which leaves your warehouse—the label.

In conclusion, I thank you for the kind attention you have given to my rambling remarks. It is a great pleasure, as well as a privilege, to meet with you, and I assure you I never leave one of your conventions without feeling that I have been both benefited and blessed. (Applause.)

Next was introduced Mr. Wm. Clendennen, who gave one of his characteristic talks on advertising, and was followed by Mr. James E. Hoff, who spoke upon "Insurance Costs." The session then adjourned.

THURSDAY MORNING'S GENERAL SESSION

April 24, 1924

The meeting was called to order at 10:30 by President Hill.

PRESIDENT HILL: The first paper this morning will be by Mr. Grosvenor, Chairman of the Tomato Section of the National Canners Association, on "Tomato Thoughts."

MR. E. O. GROSVENOR: I shall have to turn the reading of that paper over to Dr. Street, because my throat is in such a condition that I cannot read it.

(Dr. Street read Mr. Grosvenor's paper, which will be published later.)

PRESIDENT HILL: We will now have the pleasure of listening to an address by Arthur Hamilton, who is the President of the Ohio Canners' Association. Mr. Hamilton will talk to us on "State Associations, Their Sphere of Usefulness." (Applause.)

MR. ARTHUR HAMILTON: It is unfortunate that there were not more present to hear the excellent paper which has just been delivered, but, Mr. President, one of the finest speeches I ever heard was in the House of Representatives, delivered to the speaker and the clerks.

I attended this morning a breakfast which was one of the most interesting breakfasts that I have had for some time. I was invited by the Secretaries of the State Associations of the various States in the Middle West, and if you canners could have been present at that time and heard discussed by those who were there who are Secretaries of the State Associations all the things they talked about, I feel satisfied that everyone of you would be members of your State Associations. I am sure that you do not realize the interest they are taking, the time that they are devoting to your interests, for your progress, for your betterment.

We do have in Ohio an association. It might have pleased the great Creator to have made man independent, but as dependence is one of the strongest bonds of society, God made men dependent on one another. Therefore, there is no industry in this nation where the individual operator can stand alone. Organization has been in the world since Adam and Eve held their meeting in the Garden of Eden. The great Church of Christ is the result of organization. It is true of every industry in this country. The canning industry is well recognized as one of the greatest and most essential industries that we have.

I don't want to take much of your time, but I do want to recite just a few of the things that are accomplished. First, it is an opportunity to meet those with whom you should be intimately associated in your own State. Down in Ohio we have an excellent representation of supply men and brokers as associate members. It is said that the supply men and the brokers get the members down in the lobby and in their rooms, when the canners should be attending their meetings. That is true to a certain extent, and down in Ohio we do give them an opportunity for meeting the canners, but when the time comes for a meeting of the convention, I am proud to say that we have the hearty co-operation of our associate members as well as the regular members.

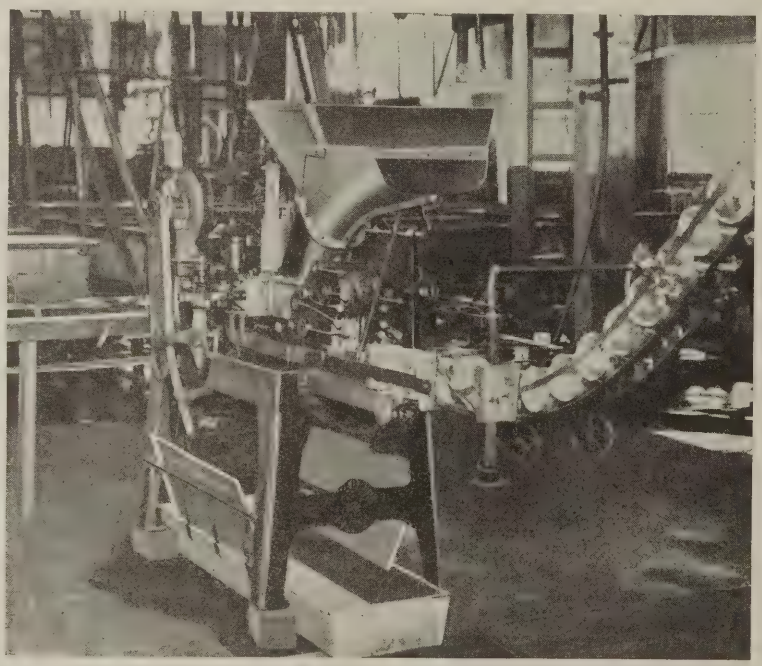
We have in our State an experiment station, and we have a committee on seeds and soils. This committee is very active every year working in conjunction with the experiment station at Worcester, and has accomplished wonderful results with reference to the canning industry in seeds and the development of seeds.

I merely mention these items of activity for the purpose of showing that each and every canner in any State ought to support his State organization. It is an activity that your ancient and honorable organization cannot reach; it is a work that no national association can reach; it is local; therefore, your State must handle it. Your State organization cannot handle it without the individual support of each and every canner in that State. My friends, if a member canner receives no benefit whatever except on the one item of the activity of the officers and the legislative committee, it is well worth every dollar of dues that you pay. You could not accomplish a thing without organized effort. That is true.

We have a committee on trade regulations. That is for the benefit of the individual members. If a member canner should have any difficulty with a buyer which he is unable to settle or mittee. Or if there is any activity on the part of any broker or any buyer which is not ethical, that matter is referred to a trade relations committee. That applies in every State in this Union that is interested in the canning industry.

The interchange of information between the secretaries is valuable, very valuable. The bulletins that are issued to you from your Secretary's office undoubtedly furnish you information that you could in nowise find out.

PRESIDENT HILL: We will now return to the paper that we should have had yesterday, but, unfortunately, were unable to reach. The subject is: "What Does Bacteriological Research Mean to the Individual Canner?" That is a very interesting subject, and will be handled by Dr. J. R. Esty, of the National Canners Association Research Laboratory. (Applause.)



(Dr. Esty's paper is held out.)

A Few of California's Canneries Where Quality

Interior View Santa Rosa Plant, Showing Anderson's Rotary Aluminum Exhausters.

HERE is shown the Santa Rosa plant of the California Packing Corporation. This view shows one of their many modern plants. The interior of this plant gives a comprehensive idea of the cook room equipment, showing clearly the line-up of the Anderson Rotary Aluminum Exhausters which includes from No. 1 to No. 10. North Branch Plant, San Francisco, and Plant No. 12, Sacramento, are equipped in a similar way. This company has appreciated the value of the long, low temperature exhaust to improve the qualities of their famous Del Monte Brands.

"A Few Essentials in Beet Packing"

PRESIDENT HILL: Dr. T. O. Goeres, Chairman of the Beet Section of the National Canners Association, Lodi, Wis., will now address us. (Applause.)

DR. T. O. GOERES: To be brief, I will try and touch upon what we consider the most essential in successful beet packing.

1. We must consider soil. Beets, like every other vegetable, in order to get the required color, texture, flavor, shape, yield, etc., must be planted in favorable soil. We, in Wisconsin, are satisfied from past experience that the black, partly sandy, silt loam is the favorite soil. Soils of the nature of muck, such as well-drained marshes usually produce on very favorable conditions. The soil must be well supplied with water and organic matter.

2. **Preparation of the Soil.** We recommend fall plowing. Start working the soil as early as possible in the spring; then, about once a week, drag it thoroughly with a fine tooth drag up to planting time. Working the soil in this way keeps down the weeds, and helps hold the moisture. Fall plowing also helps to winter-kill weeks. Just before planting give your soil a final dressing, then a thorough planking or rolling.

3. **Fertilizer.** William S. Meyer, D. Sc. F. C. S., Director in Chief, Chilean Nitrate Committee, has the following to say in a pamphlet entitled "Commercial Vegetable Products."

"Beets grow well only when the weather is cool. A sandy, black loam soil is best, as heavy soils produce crooked roots, and many hairy branches. Fifteen to twenty-five tons of well-rotted manure and one to two thousand pounds of Mixture "B" per acre should be used for the crop. In addition, a top dressing of two hundred pounds of nitrate of soda three or four weeks after planting will give the plants a good start.

"Formula 'B' for beets, analyzing about 5-6-8:

Nitrate of Soda	500 pounds
Tankage	300 pounds
Acid Phosphate	1,000 pounds
Sulphate of Potash	200 pounds
Total	2,000 pounds

4. **Planting.** We sow all our beets with a hand-pushed planter. Beets want to be planted just as shallow as possible. We find that we can do this much better and more evenly with a hand-planter, rather than with a horse-drawn planter. If the soil is properly prepared, this hand-planter pushes comparatively easy. A man can easily sow a couple of acres per day. We sow them in rows from 16 to 18 inches apart. Our sowing is not started until after the 1st of June. I will give you the reason for this late sowing later.

5. **Seed.** The most essential from the jobber's point of view seems to be color. They insist on the dark red color. We find that the Detroit dark-red variety is the most favored seed, not only on account of its color, but because of its texture, flavor and shape. Undoubtedly there are other varieties of seed that are just as good, but we have had no experience with them. Of course, the texture of the beet must be anything but woody or stringy. The shape should be as round as possible. The more round the more accurate the grading. Through the courtesy of the Garrahan Canning Company, of Luzerne, Pa., I have a few cuts on display that illustrate the desired shape very well. We sow eight pounds of seed to the acre. This sows quite thick, which helps to eliminate too many large beets.

6. **Cultivation.** The big idea in growing beets is to keep the weeds down. If the grower will do as I suggested under "Soil Cultivation," he won't have much trouble with weeds. The idea is not to let the weeds get a start. The old hoe and the push cultivator are the most important implements. We use a horse cultivator, too, but all the "close-up-to-the-plant" work is lone with a hand-pushed cultivator and the hoe.

7. **Harvesting.** Pulling and topping is the old familiar expression. This used to be tedious handwork, but now we have a machine which does the topping. The tops, or greens, have to be twisted or pulled off, instead of being cut off. Cutting causes the beet to bleed, while the twisting or pulling does not. Bleeding does not only affect the coloring, but causes them to wilt. It seems to take the life right out of the beet. The Hanson Machine Company has a machine known as the "Hanson Dumond Topper" on the market. We have not used this machine, but have one ordered, and we are going to use it on our own farm. Some of the boys who have used it speak very highly of it. I have had numerous inquiries from canners from other States in regard to this topper, so I brought a cut of the machine with me, and if there are any who are interested I will be glad to take this up with them later. Of late years we don't start the harvesting of beets until October. We prefer a spell of cold weather before we start packing. We find that a cold snap adds to the color and sweetness of the beet. I don't mean to say that we have a killing frost, but snappy nights, and even a light frost if possible. We used to pack early beets, but the results were unsatisfactory and the quality not as good in comparison with the later pack.

8. **The Cost of Raw Beets.** We used to buy beets at a flat rate per ton. This was not satisfactory because the grower neglected the small beets. The last few years we bought our beets on the graded scale. All beets that are three inches and over in diameter we paid $10 per ton; for all beets less than three inches in diameter we paid $15 per ton. We grade about three loads from each field, and take that as an average. We are contemplating a three-grade system, which we feel will encourage the grower to raise more small beets. The system will be something like this: $7 per ton for all beets over three inches in diameter; $15 per ton for all beets not over three inches, or less than two inches in diameter; $25 per ton for all beets less than two inches in diameter.

Of course, when growing your own beets you have better control over the sizes, and generally get a bigger percentage of small beets. I am inclined to believe that the new topping machine will stimulate the delivery of more small beets, for it is said this machine tops the little fellows very nicely.

9. **Packing Beets.** In our receiving shed we have a cylindrical grader, which grades into five distinct grades. From this grader they are conveyed into the factory to a washer (we use our old corn washer). From this washer they are put into crates and par-boiled or blanched. We do this in our retorts. The time varies from ten to twenty minutes at 212 degrees, depending on the size of the beets. The bigger the beets the longer the time required to properly blanch them. From the retorts they are taken to the peeler (an ordinary vegetable peeler), and from three to the trimming tables. Now we come to a comparatively new feature. The Beet Section of the N. C. A. has adopted a standard of sizes. ;To comply with this new standard, we run the beets through another grader to get a more accurate grading Right here I want to say, if there is a manufacturer in the room, that the beet packers are in the market for a standard grader that will comply with the sizes as adopted by the National Beet Section. I have numerous pamphlets for those interested, which may be had for the asking.

10. **Processing.** We process according to Dr. Biglow's recommendation, namely:

	Process Time in Minutes With Retort Temperature of 230°	240°
No. 2 Cans	50	25
No. 3 Cans	50	25
No. 10 Cans	60	35
No. 2 Glass Cans	55	30

The process time given for the No. 2 glass cans is intended for beets packed in water. If vinegar is added, the beets may be processed at a substantially lower temperature, or for a shorter time, depending upon the amount of vinegar employed.

11. **Grading.** Standard grades adopted by the Beet Section of the N. C. A. The beet packers used to pack all the way from fifteen to twenty varieties as to count; for example, 7/ov., 12/ov., 15/ov., 17/ov., 20/ov., and so on, but through the efforts of our Section, we have eliminated them to nine grades, cut, sliced, diced, and six whole sizes varying from one to one and thirteen-sixteenth inches in sizes. To be accurate, the following are the grades adopted: Cut beets—all beets over 2-3-4 inches in diameter cut to uniform size. Sliced beets—beets 2 inches to 2¾ inches in diameter sliced to 5-16 of an inch in thickness. Cubed beets—all beets over 2¼ inches in diameter are cubed to a uniform size of ¼ of an inch. Whole or no count—a can full of beets of 2 inches to 2½ inches in diameter. The three grades above are for all sizes of cans. Whole beets are graded and known by the count of beets in the can.

No. 2 cans, contents 1 lb. 4 oz.:

Count 50 over per can 1 inch in diameter.
Count 35 over per can 1⅛ inches in diameter.
Count 25 over per can 1¼ inches in diameter.
Count 15 over per can 1 7/16 inches in diameter.
Count 10 over per can 1⅝ inches in diameter.
Count 7 over per can 1 13/16 inches in diameter.

No. 3 cans, contents 2 lbs. 1 oz.:

Count 90 over per can 1 inch in diameter.
Count 60 over per can 1⅛ inches in diameter.
Count 40 over per can 1¼ inches in diameter.
Count 30 over per can 1 7/16 inches in diameter.

Count 20 over per can 1⅝ inches in diameter.
Count 15 over per can 1 13/16 inches in diameter.
Count 10 over per can 2 inches in diameter.

No. 10 cans, contents 6 lbs. 10 oz.:
Count 300 over per can 1 inch in diameter.
Count 200 over per can 1⅛ inches in diameter.
Count 130 over per can 1¼ inches in diameter.
Count 100 over per can 1 7/16 inches in diameter.
Count 70 over per can 1⅝ inches in diameter.
Count 50 over per can 1 13/16 inches in diameter.
Count 30 over per can 2 inches in diameter.

Through the courtesy of the Garrahan Company, of Luzerne, Pa., I have their various sizes on display packed in glass jars. Those who are interested may examine the same at the close of this morning's program.

I have also a surplus of pamphlets giving the grades and sizes which may be had for the asking.

If you have not tried the processing of grade beets, I think it would be worth your while to experiment to just see whether beets that are kept in the ground until we have a frosty spell of weather won't be of a better color and will have more sweetness than the early beets. (Applause.)

PRESIDENT HILL: This closes our program for the morning. We will now return to the reports of standing committees. Has the Committee on Conference anything to report?

MR. E. W. VIRDEN (Iowa): We have nothing to report. There has been no representation from either the Wholesale Grocers Association or the American Grocers Association, so we have nothing to bring before the body.

PRESIDENT HILL: The Auditing Committee's report. Mr. Bacon, will you report on the books?

MR. ALBERT T. BACON (Illinois): Western Canners Association, John A. Lee, Treasurer. Statement of cash receipts and disbursements, November 6, 1923, to April 19, 1924:

Balance November 6, 1923		$ 824.06
Receipts:		
Association dues		2,775.00
Total		$3,599.06
Disbursements:		
Convention Expense, Nov., 1923	$316.21	
J. W. Hill, President, Expense	216.11	
Salary, John A. Lee, Treasurer	416.67	
Stenographic and Clerical Services	357.07	
Advertising	60.00	
Printing, Stationery and Supplies	515.91	
Telegraph and Telephone	62.65	
Dues	42.00	
Miscellaneous	79.83	
		2,066.45
Balance April 119, 1924		$1,532.61

We have audited the accounts of John A. Lee, Treasurer, Western Canners Association, from November 6, 1923, to April 19, 1924.

All cash shown by the books as having been received has been properly accounted for and disbursements have been made only on approved vouchers.

The cash balance as at April 19, 1924, is in agreement with certificate furnished us by the Boulevard Bridge Bank of Chicago.

Respectfully submitted,
(Signed) ALBERT T. BACON & CO.,
Certified Public Accountants.

PRESIDENT HILL: If there is no objection, this report will be received and placed on file.

Report of the Traffic Committee, Mr. Clapper.

MR. WILLIAM CLAPPER (Iowa): We have been endeavoring to get the railroads to help out the Middle West and the Pacific Coast some, and they have just recently adopted a concession to the extent of giving us a 75c rate with an 85-pound capacity, as against the dollar with a 60-pound capacity, making the same per car, but less per ton.

PRESIDENT HILL: This report will be received and made a part of the records.

Cost Accounting—Mr. McCartney, of Ohio, the Chairman of that Committee, is not here.

Mr. Deniger, of Factory Efficiency, is not here.

Mr. Sears, of Soil Conservation, is not here.

Membership—Mr. Stare, of Wisconsin, is not present.

By-Products—George Stocking is not present.

Next we have the report of the various temporary committees. The Committee on the Secretary's Report.

MR. E. W. VIRDEN (Iowa): Mr. Chairman, I will read the Secretary's report because it is of interest, and I think that we will all be glad to hear it again.

Mr. Virden read the Secretary-Treasurer's report.

MR. VIRDEN: The committee appointed by the Chair was Cosgrove, Mitchell and Virden. We considered this report and we found it very complete, and we move the adoption of the report and that it be filed. We wish to commend the Secretary for the unusual activity of his office. We feel that in Mr. Lee we have an official that is particularly adapted to this line of work and he has the entree to the newspapers, which, perhaps, nobody else would have in the same way, and the publicity that he has given to canned foods generally has been of untold value.

PRESIDENT HILL: We are very much pleased to hear this report. The motion is made to adopt the report and with the thanks of this Association to Mr. Lee for his efficient work during the past year. Kindly take this action by rising.

The motion was carried unanimously.

PRESIDENT HILL: Mr. Whitman, Chairman of the Resolutions Committee, is absent. Will the Secretary read these resolutions?

Resolutions

SECRETARY LEE: "Resolved, That the thanks of the Association be extended to Hon. William E. Dever, Mayor of Chicago, for his kindly welcome to the city.

"Resolved, That the Association hereby express its appreciation to those whose addresses have cheered and encouraged its sessions and that we thank them for their presence and cooperation.

"Resolved, That we record, with pride, another year's efficient and energetic service rendered the Association by its genial Secretary, Col. John A. Lee.

"Resolved, That this Association expresses its sincere appreciation to J. W. Hill, of Iowa, who has acted as its president for two years, and for his splendid service in promoting the welfare and interest of its members.

"Resolved, That it has been a pleasure to have with us the several sections of the National Canners Association, as well as the National Kraut Packers Association, the National Food Brokers Association and the Canning Machinery and Supplies Association, and that their presence has added greatly to the interest and value of the meeting.

"Resolved, That we deplore the loss of several members of the Western Canners Association who have been taken from us by the grim reeper, and that we hope to meet them in the glorious life beyond this, where they have gone to their reward.

"Resolved, That we hereby acknowledge the receipt of the telegram of kindly consideration from the American Wholesale Grocers Association through E. A. Humphrey, Chairman of the Conference Committee, and that we heartily reciprocate its expression of friendship and esteem.

"Resolved, That a committee be appointed as follows (which committee has been named by the President):

Mr. Ira Whitman, Illinois,
Mr. E. O. Grosvenor, Indiana,
Mr. Walter A. Reed, Michigan,

for the purpose of ascertaining the probable cost of printing and circulation of many of the valuable and practical addresses delivered at their convention, and that the committee have power to act in the matter in co-operation and with the approval of the President and Treasurer."

A motion was regularly made, seconded and carried to adopt the report of the Resolutions Committee.

The Election

PRESIDENT HILL: We will now have the report of the Nominating Committee, composed of Mr. L. A. Sears, of Illinois; Mr. Arthur Hamilton, of Ohio, and Mr. George Stocking, of Wisconsin. I understand Mr. Sears is not in the room, and the Secretary will read the report.

SECRETARY LEE: The Committee makes the following report, and has handed it to me, with the request that I read it:

J. J. Rogers, Pendleton, Indiana, President.
Arthur Hamilton, Lebanon, Ohio, Vice-President.
John A. Lee, Chicago, Ill., Secretary and Treasurer.

Board of Directors—Walter Trego, Hoopeston, Ill.; William Pendleton, Lawrence, Kan.; W. B. Stokeley, Newport, Tenn.; C. C. Dawson, Balir, Neb.; Roy Nelson, Crane, Mo.; E. H. Van Zandt, Longmont, Colo.; H. L. Herrington, Ogden, Utah; W. H. Taylor, Watertown, Minn.; J. B. Weix, Oconomowoc, Wis.; Howard Orr, Circleville, Ohio; Mac Ewing, South Haven, Mich.

I move the adoption of the report as read.

The motion was seconded.

MR. VIRDEN: Before the adoption of this report I would like to call your attention to the fact that the entire Board of Directors is elected every year, and it seems to me that it would be a wise thing for us to elect only half our board membership at any one meeting and have a hold-over of about half of the Board of Directors, so that we would not have a new personnel every year.

In order to bring that matter before the house, I suppose a motion would be in order to amend the Constitution.

SECRETARY LEE: It would require an amendment of the Constitution. Just now I find that at least half of that Board of Directors are hold-overs or re-elected men. The probability is, if your resolution stated that we adopt the principle of electing half of the Board of Directors each year, and that the other half hold over for next year, that can be done at the next convention. In that way, however, you would have to give your directors a term of two years. Suppose you make a motion, Mr. Virden, that those members of the Board of Directors who will be re-elected hold for one year and that the others hold for two years.

PRESIDENT HILL: I think we should divide this matter. We will entertain your motion first and then elect the officers afterward.

MR. VIRDEN: I make the motion that the hold-overs nominated for directors for the coming year be elected for a one-year term, that the new members nominated shall be elected for a term of two years, and that in the future the election shall be so held for directors that approximately one-half will be elected each year.

The motion was seconded and carried.

PRESIDENT HILL: The question now before you is upon the adoption of the report of the Nominating Committee. The Chair will entertain a suspension of the rules and authority given to Mr Virden to cast the unanimous vote of all present for the gentlemen named for the respective officers.

The motion was regularly made, seconded and carried unanimously.

MR. VIRDEN: Mr. President, the unanimous vote of the Association is cast for these officers.

PRESIDENT HILL: I declare these gentlemen duly elected to their respective offices for the ensuing year.

Gentlemen, I want to take this occasion to thank the Secretary, particularly, for the very hearty co-operation he has given me during my term of office, and also to thank the members at large for their hearty affiliation with us in matters pertaining to the business of our organization. I relinquish my authority to my successor and wish for him abundant success.

With this statement you may consider yourselves adjourned sine die.

The meeting adjourned at 12:30 o'clock.

ADJOURNMENT

Problems That Face The Industry

By President ROYAL F. CLARK.

THERE are problems confronting the canning industry today that, to my mind, are greater than have ever confronted it during its entire existence.

The solution of these problems calls for the wisdom of the very best men in the industry. We are passing through what might be termed today a high-tension period. A short time ago we witnessed an advance in materials and wages that astounded the recipients. That period was followed by a depression which wrecked many. We have witnessed during the past eighteen months a strengthening of values, but we do not have the confidence of the American citizen in these values that we had during the other period of inflation.

There are many reasons for this. Politics cuts considerable figures in this lack of confidence on the part of the business men of today and I want to say that it behooves every canner and every businessman to weigh very carefully each step that he takes in his own business. I do not want to make a pessimistic picture out of the future, but I do not believe that we have any right to be too optimistic. One thing we have got to do is to keep our feet on the ground to proceed carefully if we are to have a successful season.

Adjustment periods will come from time to time as America expands in its industrial and social life, and I believe that the canners of this country will continue to play a very important part in these periods. There are many reasons for making this statement. Conditions of living have changed materially during the past few years. We have thousands and thousands of people leaving their farms and the rural districts and coming to the cities. Experts tell us that the large cities can very well take care of this influx, and that they are needed. You have many thousands of people living in apartments and using the kitchenette that you didn't have twenty-five years ago, and canners, being conservers of food, are able to offer foods that are fresh, and just as fresh as those picked from the garden.

The growth and happiness of any people depends upon their ability to procure first, the necessaries of life, and second, those things that enables them to maintain a respectable position in society in their own sphere.

The businessman of today, if he expects to be successful must have a vision that will bring to him an understanding of the problems of every man, woman and child in this nation. Questions involving capital and labor must be settled and *settled* for all time. I believe that capital and labor have gradually been coming together, and I believe also that if we could get rid of seven-eighths of our present politicians, the questions that are involved that so often-times disturb business conditions, would be removed.

I don't want to talk politics, but I maintain that the businessmen of this country have got to commence to interest themselves in political questions and have got to commence to go to the polls if they expect to protect their business.

I don't know what percentage of the citizens of the United States go to the polls, but it is low, and it possibly could be compared with the low per capita consumption of canned goods. Refusal to exercise the privileges granted them under the constitution of the United States, and the constitution of the several states, is lamentable.

Lower Cost of Living—One of the problems that is confronting the canning industry today and in fact all business is the demand on the part of the consumer for a lower cost of living. It doesn't make any difference whether or not this is a superficial view taken by the people, there is and has been for the past few months a demand for a lower cost of living that we have got to recognize and deal with.

What position is the canner in? We might just as well say, gentlemen, right now that so far as canned goods are concerned for 1924 and 1925, in other words up to the time of the new pack, there can't be any reduction. You know that. Every single thing that goes into the production of canned goods has been purchased or, in other words, the cost has been fixed. The cost of your cans, seed, labels and everything else is fixed. You might possibly have lower wages, but if you have, can the people pay the price that you must get for your product? You have to think of that.

Canned foods are high, not too high if business conditions will continue as they are today or have been the past eighteen months, but too high if we have a drop, and yet our cost is fixed. Isn't that the situation?

I am of the opinion that the price of cans is too high. I say that without any particular criticism for our friends, the can makers. We can't help it so far as the production of 1924 goods is concerned, because the price is fixed under our contracts, but I want to tell you that the American Sheet & Tin Plate Company, and manufacturers of cans, and of everything else that goes into the production of canned foods, must make or in my opinion should make a very systematic study of this question before they announce recipes for 1925.

If you get the cost of canned foods too high, and this great industry that has developed topples over, the manufacturers of all these products, the canmakers and all others, will find themselves under the pile with the canner. I am not criticising, but I do want to throw out this thought to very can manufacturer, and in fact I want to go way back to the American Sheet & Tin Plate Company, I want to throw it out to the seedsmen, and to the box manufacturers, and to the label men: I want them to get the thought—that it is our duty to carefully consider the question whether canned foods are getting too high before prices

are made for these materials that will go into the 1925 production.

What I mean is that this is a problem that all of us should sit around the table, discuss and work out, and I believe that if it is necessary or if we find is necessary to reduce the cost of canned foods to the consumer, it will be better that we all shrink profits, from the tin plate people down to the consumer, and from the seedmen down to the consumer, rather then take a chance of destroying the greatest industry in the United States.

Some will say that this is a rather pessimistic view to take, but if you will carefully go over the situation, I think you will come to the conclusion that it isn't, it is a business proposition.

In the past many articles that have been manufactured and distributed in this country have gotten too high, and then the great pile went over. I have talked with some businessmen that were interested and caught in just such a tragedy, and they tell me that there wasn't' a real conference between all branches of the industry that went into the production of the final article; there was not a community of interest, or they would have been able to forestall real disaster.

There is one thing that we can do this year. We can put some real efficiency into our production, and if we do that it will mean better quality.

There is one thing that the canning industry must keep in mind, and that is that we must render a service—a real service —to the consumer from now on, if we expect to succeed. You can't render a real service without giving the consumer some real quality goods. Efficiency is one way to produce quality. It will also tend to reduce cost.

Quality—I presume that every canner who has talked on canning problems during the past ten years has spent a little time on the question of quality. I presume that every time I have attempted to make an address I have also spent a little time on the question of quality. I heard a canner not very long ago say that he would like to listen to one address made by the officers of the different canning associations in which they would leave out the question of quality, they were always hammering quality. I sometimes think that I have hammered it long enough and ought to leave it out. but when I go over the situation and think of the problems that confront us, and I take into consideration not only the canners, but the distributors, including the wholesaler and the retailer, and finally get down and think about the consumer, I am forced to the conclusion that it will never be out of place to talk about quality. When you talk about quality, commence way back with the tin plate people, and follow that question down to the consumer. Go back to the seedmen and all others that are producing merchandise that goes into the final product, the can of food, and think of quality.

Usually we talk about quality corn and think of the product itself, and then we talk about quality peas or quality tomatoes, whatever the item may be, but think of the product itself. We do not consider items of merchandise we purchase. We have got a lot of work to do in the National Canners' Association and other associations in the improvement of raw products and merchandise. The can makers recognize that fact, and they are willing to co-operate with us.

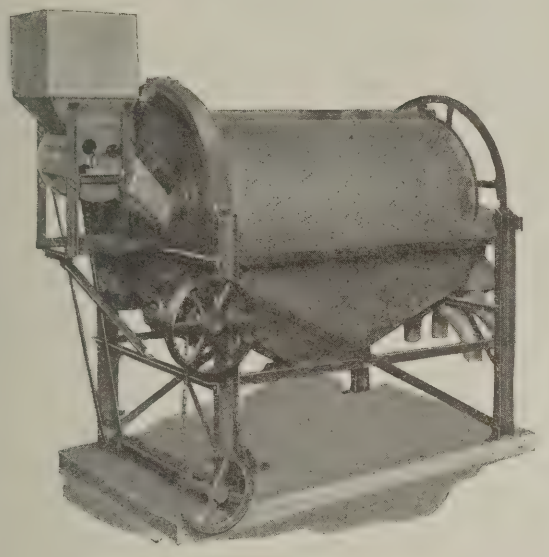
Cans—The National Canners Association today is spending a large amount of money in association with the canmakers in sloving the problems of the tin can, in the hope that they will be able to produce and distribute to the canners a better article. That is quality. We must have some real conferences with the seedmen, particularly so far as peas are concerned, if we expect to produce quality peas. I want to tell you right now that you can't produce quality peas unless you have quality seed. I also want to tell you that we have a big problem in the state of Wisconsin on this question of seed. You corn canners have had your problems relative to seed. Some of them have been solved, but the question of pea seed to the pea canner is a real problem today, and I find that thousands of bushels of seed have been delivered for sowing this year that are not right, that won't make quality. In view of that situation can we say that we have talked enough about quality? I think there has been an effort on the part of every canner, whether of vegetables or fruits or fish, to improve quality during the past few years. I also think the corn canners will not be offended if I say to them that they have a lot of room for improvement. That doesn't mean that there isn't packed today some of the best quality corn, but I want to tell you whenever you find a canner packing real quality corn, he sells it right at his desk.

There has been an improvement in the packing of peas, but we have a lot of room for improvement. When there is a large production of canned peas, then the pea canners get down to produce some quality goods. The result is, of course, that you don't have as large a pack, but they produce goods that the consumer wants and you find, if you will make an analysis, that you have increased the consumption of that article, and that applies equally to every other commodity outside of peas. Then we find that when there is a scarcity, all of us get a little lax, and that is just the place where we ought to tighten up. When we have a small production, as well as when we have a large production, the canner of peas or corn or tomatoes or anything else should be on his toes. This is not an easy business, you all know that just as well as I do. Some of our friends on the outside seem to think that the canning game is an easy one, that all you have to do is to form a corporation, build a factory and hire a fellow that comes along as superintendent, plant your seed and bring the green produce in. Of course you make a contract with the can man and buy some boxes. You see the seedmen, and you make friends very rapidly with our good friends the supply people, and on the outside they have an idea that this is an easy game. I want to tell you that the canning game is one of the hardest in this country, if it is worked right.

I am not going to say anything further about quality. No one will dispute the fact that quality production means increased consumption of any particular item, so I haven't any argument to make with you; no one will dispute me.

What are the chances for increased consumption of canned foods? You all know that they are there, but I don't believe that many of us realize what possibilities lie in the future if we can produce and article that is stamped with the word "quality" and is within reach of the rank and file. When I refer to the rank and file, I mean the wage earners and the salaried men. I don't know how many of you read the article that Jim Reeves had in the American Monthly relating to his business. He was a Irish boy who came over to New York without a dollar and started in the grocery business and has built up a large chain store organization, and he is a handler of fancy goods, quality goods. He was asked by an interviewer as to where he sold the fancy goods that he bought. He said: "It is the high wage earners and the salaried men that buy these fancy goods."

If you have a chance to get hold of that article you ought to read it. Why, every time that we have gathered any statistics or made any effort to gather statistics we find that the per capita consumption of canned goods is not only low, but very low, and since I have been president of the N. C. A. I have been astounded to know that there are so many in the United States that are prejudiced against the use of canned foods, and won't have a single can in their house. No other industry in the United States has the opportunity that we have if we produce quality and remove the preudice that exissts in the mind of so many today.



I want to call your attention to another fact, and that is the present system of distribution of canned foods. I was brought up on a farm, have lived in an agricultural community all my life, and I know the problems of the agriculturist. One of those problems is that he hasn't a good outlet for the things that he produces. When it comes to marketing his wheat he is limited to a very few markets, and when it comes to marketing his cattle and his hogs, he is limited to very few buyers. It is true that many of his problems have arisen by reason of the fact that our legislatures and Congress have enacted laws, which have developed into rules and regulations, that have compelled him to produce foods that the people don't want, but he always has been confronted with the fact that he has had a limited outlet.

Outlet—What is the canner's outlet? Four thousand or more wholesale grocers scattered all over the United States; 400,000 retail stores or more, scattered all over the United States, ready, equipped, anxious, to buy your product and hand it to the consumer. That is real opportunity, and I want to say that there has never been a time in the history of our industry, certainly never in my experience, when we have been so close (I am referring to the canning industry) to the distributor. I recall that when the National Canners Association attempted to put on and did put on an advertising and inspection plan, which it felt would work towards a greater distribution of canned foods, the distributors were not interested at all, they would not join with us in the movement. Now it is true that that plan fell at the same time the deflation period came on, but as I have said and as Jimmie Anderson has said, there were those of us who put real money into it who never regretted it, because *something* started a greater consumption of canned foods.

Today the distributors are coming to us and asking for the development of some plan to carry the message of purity and wholesomeness of cannned foods to the consumer.

The reason that this has been brought about is because we have had conferences between canners and distributors, and

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graderr, Colossus Pea Graders, and Other Canning Machinery.

WHERE CLEANLINESS IS VITAL

One of the largest manufacturers of milk products advertises that they spend more time in cleaning than in manufacture.

This may not be altogether necessary in the canning trade, but the fact remains that cleanliness is vitally related to the finest canned foods produced.

It isn't any wonder then that every year sees an increasing demand for the unequalled sanitary cleanliness so quickly, efficiently and easily produced by the use of

Wyandotte
Sanitary
Cleaner and Cleanser

The users of this specialized cleaner claim also that it not only gives these unusal results but that their cleaning costs are not any higher but in fact are often considerably decreased.

An order on your supply house will prove that these claims are true.

Ask your Supply House.

It cleans cleans.

Indian in circle

in every package

The J. B. Ford Co. Sole Mnfrs. Wyandotte, Michigan

they have sat around the table and talked over their problems.

The canner has been presented with the problem of the distributors, and the distributors has been presented with the problem of the canner, and out of it has come a request on the part of the distributor that the canners and they get together and spread the news and the gospel of the tin can.

Advertising—I want to say something about the meeting held the other day, because I know you will be interested. A request came to us from the National Wholesale Grocers Association to hold a meeting in Chicago and discuss some plan of advertising, not that the distributors were alarmed about any conditions of today, but because they feel that we are losing, and have been losing for some time, a golden opportunity to increase the consumption of canned foods. We had a meeting here in Chicago. Unable to get out a plan that was definite on account of the short time, another meeting will be held and the tentative plan will be presented to the American Wholesale Grocers Association, the National Wholesale Grocers Association, and the Chain Store Association.

I don't know what that plan will be, but the distributors are coming to us this time, and they are going to say that they will put up just as much money as we will put up. That is what they are going to say to the canner, and I hope that if the plan is worked out so that it is workable, it will have the support of every canner in the country.

Shortly after I was elected I started this campaign by writing letters to all of the directors, and finally to all of the members, asking them to co-operate with me in gathering into the National Canners Association the non-members. At that time I think I stated that the campaign would close about May 1st, but on account of some meetings to be held later in May, it probably cannot be closed until June 1st.

I inserted an article in the trade papers asking whether non-members felt they could safely dispense with certain activities of the National Canners Association, and I stated in that article that if their answer was in the negative, I would expect them to immediately send in a membership card.

We had a meeting of our Executive Committee at the La Salle Hotel this week, and we went over the budget. We trimmed it at every point that was possible, and still not interfere with the efficiency of the Organization. The budget was finally agreed upon as sufficient to keep the Organization not only intact, but to permit the same activities that we have had in the past. We have had considerable response in this campaign, and have been fortunate in securing quite a few new members. The Executive Committee passed a resolution recommending to the Board of Directors (and I think you know that the Board of Directors will undoubtedly approve the resolution) that the dues from January 1st, 1924 be reduced to three-eighths per cent, or a reduction of twenty-five per cent.

(Applause).

Understand, we have not destroyed the efficiency of the Organization but we have made certain changes, and the men who have done it have been successful in the canning business, have been presidents of this Association and active in association work, and they felt and now feel that it would be dangerous to eliminate any part that has been retained.

In that connection, did you know that the producers of green products recently voted a fund of something like $1,000,000 for advertising, while we haven't voted a cent, and have not done anything now for several years? Is that work worth anything to you or would you prefer to let it go unchecked, and let the public schools teach that vitamines are destroyed by commercial canning, and finally make the deduction that canned foods are not fit for use? Do you want that to go on? Or should we make an attempt to get at the facts, and then tell the facts to the consumer?

Do you want to stop any further study on the question of tin plate? Most of you were at Buffalo and heard Dr. Elwell. I am glad to say that since the meeting at Buffalo the can manufacturers have come in with us, and we are conducting a real investigation into the question of tin plate. In meeting with the distributors on the swell question many times last summer, this question of tin plate was brought up by the distributors. They felt that we ought to have a better tin plate. I know the can people have been carrying on an investigation for years, but the very fact that we are making some real progress on this question ought to appeal, I think, to the canners of this country.

I also asked whether you wanted to do away with the convention each year, and I think that is a very pertinent question. Everyone likes to go to the big convention, and I think every canner will admit that it does him a whole lot of good. You have an exchange of ideas, you meet your distributors, you meet your brokers, you meet your fellow canners, and you get off the single track method of doing business. It costs money to keep the National Canners Association intact, and it costs money to put on this big convention each year. I wonder if we want to eliminate it entirely.

I also asked whether you wanted to sever the connections with the universities, such as Leland Standford, Chicago, and Harvard and the fine connections you have had with such men as Dr. Rosenau, Dr. Jordan and others. I have wondered sometimes whether you appreciate what it means to have that sort of connection with these big universities, and these men. They are in readiness, if some big questions arise which threaten the canning industry to put in their time to get the truth and I want to tell you the National Canners Association has never attempted to do anything else except to get hold of the truth and publish it. It doesn't need to camouflage, and neither does the canner.

I think that we ought to have more publicity. There are a great many avenues open whereby we could get the message of purity and wholesomness over to the consumer, if we only used those avenues. We have spent years and thousands of dollars establishing certain scientific facts, and it rather appears as if we wanted to bottle up that information, and not let it get out to the people and to the consumers.

We need to do some real work along the lines of spreading the truth surrounding the production of canned foods.

This proposition is with you now. For several years I have assisted in the solicitation of non-members to join the National Canners Association. I don't believe that there can be any canners who feel, "Why, this work will have to go on anyway." Certainly it isn't the right sort of feeling to have. You want to be a part of this Association, if it is necessary to the industry, and if it isn't necessary to the industry, why should any of us spend any money on it?

Dues Lowered—We have got dues down to three-eighths of a cent on seasonal, and one-eighth of a cent on non-seasonal products. Everyone can afford that. Just think what it would mean if we had all the canners in the Association! Think what it will mean as to prestige, and think what it will mean when it comes to getting some real results.

I can't say any more. No one can say any more. No one can make you join. I am assuming there are some non-members here. If you don't want to join, we will have to get along without you, if we can. The burden will be great upon the shoulders of the present membership of about 600 out 2,000 or more canners. The burden has been great in many other activities of the Association. We have had three Canned Foods Weeks, and we have letters and material stacked high in the office at Washington, showing that thousands and thousands of cases of canned foods were moved during those weeks, into the hands of non-consumers, and yet only about 360 canners in the United States contributed anything. That is all they did; that was about the percentage the year before, and about the percentage the year before that,—about 15 per cent.

I assume that you don't want Canned Foods Week any more. I also anticipate that if you have a great production in the three principal items of peas, corn and tomatoes this year, and there is a temporary drop in the market, or you find your warehouses filled with goods and you are unable to move them until the wholesaler moves out what he has bought in futures, and then when you do move them you will have to take a less price than you sold your futures at, you will do just what you did three years ago, make a big yell for the National Canners Association to do something to save the day, and then I suppose about 15 per cent will contribute again. (Laughter and applause.)

I point to Canned Foods Week with considerable pride, because I happened to be chairman of the committee. I had a wonderful lot of workers. I have the evidence in the files that it was a success but I only had 360 canners co-operating; that wasn't right, and it is not right that the activities of the National Canners Association should be carried on by a few canners, for when you refer to 600 out of 2,000 or more, you are only referring to a few. It is true that we have about 50,000,000 cases, which is fifty per cent of the total production, but where are the other 50,000,000? Why don't they come in, so that instead of having three-eighths dues, you can have a quarter less, and why don't they come in and get hold of the string that is put out from the National Canners Association, and pull with the rest?

That is the best appeal I can make. I don't want any of you to go out and say, "He rubbed it in too hard." I heard Jimmie Anderson make an address in Wisconsin, and he referred to free riders, and some of them got awfully mad about it and Jimmie felt pretty bad. I hesitated to use that term, but I have gone just as close to it as I dare. (Laughter and Applause).

Wanted and For Sale.

This is a page that must be read each week to be appreciated. You are unlikely to be interested every week, in what is offered here, but it is possible you will be a dozen times in the year. If you fail to see and accept your opportunity your time is lost, together with money. Rates upon application.

For Sale—Machinery

FOR SALE—Make your own electricity by steam power and operate your lights and electric motors. At sacrifice--must be moved immediately: Steam Engine Electric Generating Sets of 40, 35, 15, 10, 7½ and 4 kilowatt capacity; anyone who has steam can make electricty by these sets. Also have several Electric Motors available. Standard Electric Machinery Co., 7 E. Hill St., Baltimore, Md.

1 Trescott Apple Grader, size 2⅛ inches.
10 Coons Semi-Automatic Apple Parers, complete with con veyors and hoppers, in perfect condition.
1 No. 2½ Knapp Boxer.
1 No. 3 Knapp Boxer.
1500 Genuine Golden Bantam Corn Seed.
The above machinery will be sold very reasonable for cash.
The Cuyler Packing Corp., Modeltown, N. Y.

FOR SALE—
1 150 H. P. Economic Boiler A M S E construction, 125 pounds working pressure, two years old 70 ft. Stack.
1 80 H. P. Fitzgibbons Boiler, 70 ft. Stack.
2 Link Belt Peeling Tables, 100 peelers each.
1 35 H. P. Horizontal Engine.
2 Ayars Rotary Fillers for No. 2 Cans
3 Ayars Fillers for No. 1 cans.
1 Avars Rotary Filler for No. 3 cans
1 Monitor-Thomas Tomato Scalder.
6 Process Kettles.
1 Power Crane
3 Steam Pumps.
6 Ayars Exhaust Boxes.
Pulleys, Shafting, Belting, Piping, Water Heater, Trucks and etc.
All equipment to pack 80,000 cases Tomatoes.
Chas. B. Silver, Havre de Grace, Md.

CANNING MACHINERY AT BARGAIN PRICES

The following Machinery is practically new. Some has never been used, while a good portion of the list represents Machines that were used probably from one week to one season. Bargain prices to the early buyer:

1 No. 1 Wonder Cooker.
1 No. 2 Monitor Pea Grader.
1 New Style A Monitor Blancher.
1 New Style X Monitor Whirlpool Washer.
2 New Monitor Metal Elevators.
2 New Peerless Huskers.
1 New Sprague Corn Cutter.
1 Ayars Single Line Exhauster.
6 Copper Kettles.
1 15 H. P. Vertical Engine.
1 10 H. P. Vertical Boiler.
1 150 H. P. Locomotive Type Boiler.
1 80 H. P. Lomomotive Type Boiler.
2 125 H. P. Erie Economic Boilers.
1 No. 4 Peerless Exhauster.
1 No. 5 Peerless Exhauster.
1 Invincible Picking Table.
1 Lot of Retorts, various sizes.
3 Square Steam Boxes, 6 ft. long.
1 Hansen Corn Cooker Filler.
1 Hansen Pea Filler.
2 Morral Corn Cutters.
2 Tomato Sorting Tables.
2 Rotary Tomato Washers.
1 Lot of Galvanized Screw Conveyor for Cut Corn.
2 Kern Finishers.
2 Sprague Lowe Pulpers.
2 Sprague Lowe Pulp Finishers.
1 Lot of Belting from 4 to 24 inches wide.

We offer the above machinery and supplies at rock-bottom prices, all guaranteed to be new or as good as new.

A. K. ROBINS & CO., Baltimore, Md.

SLAYSMAN DUPLEX TRIMMER—SLITTER

Trims the sheet absolutely true, and drops it onto the feed bed of the Slitter where it is cut into the desired sizes—2's 3's 10's etc.

THE TWO OPERATIONS —TRIMMING and SLITTING—IN ONE.

Speed 60 to 90 sheets per minute, depending upon the operator. Saves labor, handling, time, and floor space.

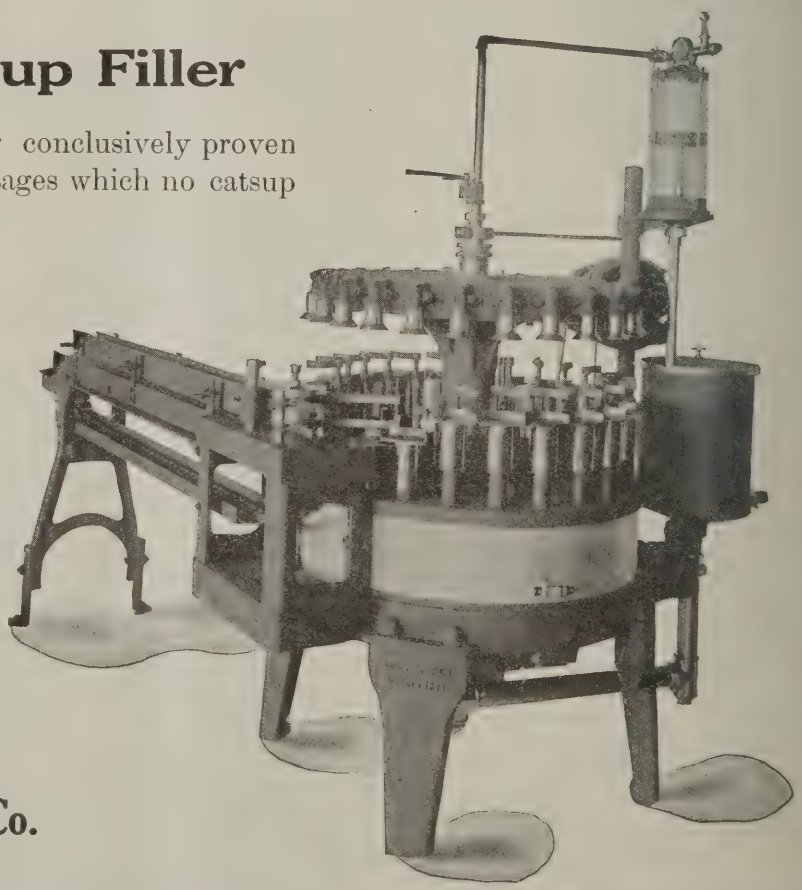
Euilt on rigid base to stand strain. Guaranteed.

SLAYSMAN & COMPANY **801 E. Pratt St.,** **BALTIMORE, MD.**

The Kiefer Catsup Filler

The new Kiefer Catsup Filler, having conclusively proven its worth last season, presents advantages which no catsup bottler can afford to overlook.

It fills without slop or waste and will not deposit catsup in broken bottles.



There is no perceptible loss in temperature when filling.

Metal contact is reduced to a minimum.

Nothing to take apart when cleaning at the end of the day's run.

We are willing to prove these things to you in your plant. Many manufacturers have already placed their order for this season.

Get your order in before it is too late.

The Karl Kiefer Machine Co.
Cincinnati, Ohio.

The Markets

BALTIMORE, MAY 12, 1924

WEEKLY REVIEW

The Buyers Are Taking a Holiday—Canners Should Learn to Ask the Right Price for Both Spots and Futures—Let Low-priced Futures Alone—Crops and Prospects the All-Important Consideration.

LET THE MARKET ALONE—Whether you want to or not, you must just about forget the canned foods market on both spots and futures, because the buyers have gone into a slump—the first effect of their bankers' warnings to buy conservatively—as if they have done anything else for months. In fact, one large banker is quoted as having said that there is a buyers' strike on at present.

So far as spots are concerned, this need cause no worry to the holders. What goods are left in first hands will be moved before new goods arrive, and at the prices the holders ask for them. And we mean just that. The trouble with a great many canners is that they haven't the nerve to ask the right price, either for spots or futures. They are too timid for their own good.

And regarding futures, for your own good you had better be careful. There are some canners who seem to have no adequate idea of costs, or possible costs, this season—or any other season—and they are either permitting their representatives to offer their goods below cost, or some hungry brokers are trying to curry flavor with their buyers at the expense of the canners who pay them, and are quoting future tomatoes, especially, too low. No. 2 tomatoes at 85c and No. 3 tomatoes at $1.25 cannot be packed in 1924, according to present outlook, no matter what the crop may be. So, while these distributors of the market are busy, keep away and let them kill themselves if they want to. But the truth is the entire canned foods market, in all sections, is reported dull and dead, and "nothing doing," and that is a bad market to come onto. Let it alone; it will come back. And, besides, you do not want orders on your books that mean certain loss.

THE CROPS—The important consideration with every canner right now is the condition of crops and what are likely to be the prospects. The season seems to be at least two weeks late in every section, and seeking and soil preparation are both behind. In New York State they have had frosts this week, but the fruit crops were not far enough advanced to be hurt by this, as they are late. Frequent rains and backward weather have held the growers back on planting, and preparation for other crops, and it is getting so late now that this is becoming a consideration.

In this Tri-State section there is a peculiar condition. At the Tri-State meeting in Wilmington this week the crop experts reported that the Community Plant beds, of which there is a considerably increased number this season, even New Jersey having put out some such tomato beds, and Delaware likewise, are in very fine condition, well prepared and carefully taken care of, and that the plants are mostly spoken for at this time. The canners and growers are looking forward to their supply of plants from these supervised beds with great hopes. This does not mean an excessive acreage, because most canners whom we saw are conservative in their preparations, and many of them have cut down their amounts from last year, but it means better plants, better fruit and a possible increase in yield, if the season is right; and thereon hangs the tale. The field crops, grasses and grains do not seem to be doing as well as they should. The trees, both fruit and shade, are all out and blooming profusely, and there has been no frost to hurt them so far; but the ground is as hard as iron, and it is explained that there was not enough hard freezing this past winter to break up the ground and let the water in. This condition is beginning to worry the growers, and it may easily be a very considerable factor in the production of the season. One thing the tomato growers are trying to do is to bring their crops in early this season. For this purpose they sent South, in one particular county, for a lot of Southern-grown tomato plants, and are going to try to get tomatoes ready for the canneries early. Some of the plant experts fear these plants may bring into the section some of the tomato diseases that they have always been free of here, but this is being watched carefully. There has been an overabundance of rain, but the hard condition of the soil prevented the proper storage of it, and drouthy conditions are predicted. On the lighter soils, peas are making quite good progress, and, generally speaking, the crop outlook at this time is quite favorable.

Unfortunately, there seems to be an idea prevalent among the buyers that the acreage and production will be immense. There is no ground, in fact, for this. The growers are working together as a unit, under the supervision and management of the County Agents, and they have planned their work so that they will avoid a glut. This is so true that there is reported a thing that was heretofore unheard of in cannery crops. One entire section of the Peninsula, embracing practically all the growers of tomatoes, sold, through this County Agent, their entire tomato crop to one canner at prices ranging from 32½c per basket down to 27c per basket, graded on the time of delivery, and all above the prevailing price of 25c per basket. It marks a new day when the growers ban together and sell their output as a unit, and it means the beginning of the long-heralded co-operation of the growers. But more than that, since this system of unit action among the growers is in force all through this great tomato-growing region, it means that they intend to so control the amount of tomato acreage set out that they will not break the market against themselves. How, then, is a tremendous acreage of tomatoes to be gotten, as the buyers seem to think is certain? It simply will not be. They expect to get more tomatoes from the same acreage and of better quality, for the whole drive now, by both canners and growers, is to raise

the quality. They learned last season that they could do this, for Maryland produced the finest crop of tomatoes in its history last year, and they are going to do it again this season, and put it into the cans in the same way. That is the program that all are working toward.

Wisconsin seems to be getting along well with its pea planting, although somewhat late, and New York State is in the same position. Indiana and the Central West are in just about the same condition as the localities described. Indiana has prepared for a good-sized crop of tomatoes, the acreage only slightly larger, if any, than last season, and this acreage is generally planted from Southern-grown plants.

They are making good progress in breaking ground for corn, and we hear of no desire to radically increase this acreage.

NEW YORK MARKET

Market Generally Quiet—One Cause for a Dull Market—California Spot Canned Fruits Strong—Indiana Turns to Maryland and Delaware for Tomatoes—Light Pack of California Spinach — Jobbers' Supplies of All Grades Below Normal.

New York, May 7, 1924.

By "New York Stater,"
Special Correspondent "The Canning Trade."

QUIET Market—While there is a healthy tone characterizing the market, insofar as prices are concerned, distributors do not appear to be unduly anxious to acquire additional holdings at this time, and are limiting their purchases to small quantities.

A Lesson for Canners—There is a lesson for canners to be drawn from the present spot canned foods market. The market, statistically, is all in favor of the seller. Holdings are depleted, the trade is in need of supplies, and all distributors are in need of additional supplies. Despite this condition, and general recognition of the market position, distributors are taking canned foods only in very small quantities, for immediate requirements. This discounts the canners' position of advantage, and, in fact, puts the market more strongly in the hands of the buyer in many instances, as canners get panicky with the approach of the new canning season and unload what small surplus stocks they may have on hand. Thus, a market which normally would be strong and advancing, is turned into a dull and featureless affair. Wholesale grocers have sufficient market knowledge to avoid a buying stampede. The condition of the canners would be much better, on the average, if they would take the same precautions to avoid a selling stampede. Buyers are not throwing heavy orders on a strong market, to further strengthen it, and packers should not throw heavy offerings on a quiet or easy market to further weaken it.

Canned Fruits Strong—Many of the independent California fruit canners have followed the lead of the California Packing Corporation, and have advanced their prices on spot canned fruits. Standard cling peaches have now generally strengthened to $2.00a$2.05 per dozen, f. o. b. California, and are available only in limited quantities. Other fruits, particularly of standard grade, are showing similar firmness. The cleanup of No. 10 pie fruits has been very thorough on the Coast, and the packers will go into the new season with practically bare holdings of this size and grade.

Spot Tomatoes—There was a fair inquiry for Maryland and Delaware pack for prompt shipment, but buying was not up to the volume which present conditions in the jobbing market would appear to justify. Standard No. 1s are held firm at 60c per dozen, with 2s at $1.05 3s at $1.40, and 10s at $4.50, f. o. b. Baltimore cannery. For shipment from Peninsula canneries, the market is quoted at 60 cents for 1s, $1.02½ to $1.05 for 2s, $1.35 to $1.37½ for 3s, and $4.50 for 10s, all f. o. b. factory.

Indiana Tomatoes—Stocks of Indiana spot 2s are cleaned up, and the trade which normally draws its supplies from this territory is now turning to the Maryland and Delaware packers for stocks. Indiana standard 3s are available in a small way at $1.60 and 10s at $5.55, but Eastern pack are available at such a differential that more interest is being shown in the latter by mid-west buyers.

Southern Futures—The market is quoted at 52½ cents for standard 1s, 85 cents for 2s, $1.25 for 3s, and $3.85 for 10s, all f. o. b. cannery. The demand is light.

Coast Spinach Short—With the California spinach pack closed, the available supplies are very light. In order to avoid pro rata, some of the packers are reported to have bought from competing canners. The market on the small surplus available for shipments is firm at $1.05 for 1s, $1.20 for 2s, $1.45 for 2½s, and $4.85 for 10s, all f. o. b. cannery, with many packers quoting 5 cents per dozen over these figures. Southern packers are quoting new pack for immediate shipment at $1.00 for 2s, $1.40 fro 2½s, $1.45 for 3s, and $4.20 for 10s. At this differential from the California market, the Southern packers should be able to work up a good sale for their pack this season.

Corn Market Higher—There has been a steady market for standard corn during the past week, but buying was rather light throughout. The market is being quoted for cannery shipment at 95 cents for 2s, $1.05 for extra crushed. Distributors are carrying only light stocks of this item, but with futures quoting 5 cents per dozen under the spot price, they prefer to operate in hand-to-mouth fashion until the new pack is available.

Jobbers' Stocks Short—Jobbers' holdings of all grades and varieties of canned foods are much shorter now than normally at this season of the year. Many of them are unable to give their trade certain popular items and brands, and others are filling in as near as possible with brands of a quality equal to the favored brands which they have been handling for years past. However, the situation is such that no one distributor is able to take much advantage of a competitor, as all appear to be in the same fix when it comes down to short supplies.

Michigan Fruits—Sales of new pack Michigan canned fruits have slowed down somewhat. Buyers are rather bearish on this line, and look for lower prices when the packing season comes along. Canners are not forcing the situation, and appear to be disposed to let matters take their course until they start operating on their 1924 pack, and know more definitely just what their costs and probable production will be.

Pineapple Quiet—While the market for Hawaiian pineapple has rallied a little since its recent weakness, there is little buying interest shown save possibly on crushed, which is in light supply. Buyers appear content to pick up small lots to fill in until prices on new pack are named, which is expected to be some time next year. Pineapple canners are seeking a larger outlet for their pack in Europe this year, it is understood. South African canned pineapple has become quite a factor in the British market, and is furnishing keen competition to the Hawaiian pack.

CHICAGO MARKET

A Short Market, but a Strong One—Future Tomatoes Show Slack—Future Corn Going Exceptionally Well—Wisconsin Pea Packing in Full Swing—Drought Hits California Fruit—All Other Sections Report Favorable Conditions—Apples Plentiful.

Chicago, May 9, 1924.

By "Wrangler,"
Special Correspondent "The Canning Trade."

THE Chicago market can be reported as quiet, but firm, in relation to canned foods. This situation arises from the fact that staple goods are quite scarce, and, therefore, prices are firmly held. The quietude of the market results from the fact that staple canned foods are nearly all sold out of the 1923 pack, and there are no supplies with which to do business. That is to say, that the supplies on hand are so insignificant in quantity that transactions are difficult and sales are excessively small.

Eastern Tomatoes—It is reported from the East to this market that No. 2 size tomatoes have advanced to $1.05a$1.10 per dozen, f. o. b. Maryland and Delaware for prompt shipment, and that other sizes are unchanged as to price. There is no buying at the advance yet, but will be soon, as the market is poorly supplied with canned tomatoes and wholesalers are now trying to secure some at the old price of 95c per dozen, which is, of course, impossible, or, at least, difficult, to do, as all the stock is held in Maryland and Delaware, with possibly a few in Virginia.

Florida is not offering any canned tomatoes at present, from the fact, I suppose, that shippers of fresh tomatoes in crates are paying more for them than the canners can afford to pay and pack at present prices.

Futures in canned tomatoes are not selling. There is a disposition on the part of wholesalers to buy a few fancy grade tomatoes for future delivery and private labels, but they are not disposed to buy except from packers that have heretofore supplied them, and business is consequently small.

Canned Corn—The large quantity of future canned corn of 1924 pack has been sold. Iowa reports that the sales now exceed those of last year, and that orders are still coming in. The corn canners of Iowa have improved the quality of their canned corn pack very much in the past two years, and this fact has probably very much to do with their having been able to sell futures so largely ahead.

The Illinois Canners' Association, Indiana Canners' Association and Wisconsin Canners' Association are not giving us very much information in relation to future sales or spot supplies through their secretaries. Whether this is a fixed policy of those associations or whether it has not yet seemed a good policy to do so, I do not know.

Canned corn for spot delivery or immediate shipment is in fairly good demand for standard and extra standard grades. The general price in all States of the Central West for standard corn No. 2 is $1.00 per dozen, although this can occasionally be shaded to 95c. Extra standard quality is held at $1.05 to $1.10 per dozen, f. o. b. canneries. There is not much contracting for future corn among the large metropolitan jobbers. They are disposed to hold off until later in the season.

Weather for preparing the ground for vegetables for canning purposes and for pea planting during the past week has been excellent, and the ground, I understand, is in good condition for cultivation.

Peas—Pea packing in Wisconsin has been going on at a rapid rate for two or three weeks past, and I understand that the planting of sweet peas, or the late variety, has now begun, and is in good progress.

The weather has been cool in Wisconsin, and the growth of the early planting of peas has been, therefore, retarded; but now that the late planting is going into the ground, if we should have warm and favorable growing weather, it is possible the early planting and late planting of peas may come into maturity or canning condition about the same time which would be unfortunate and very embarrassing and confusing to canners. Canners are hoping, however, that this will not be the case.

Wholesale grocers are very well pleased to note that the opening price for Columbia River chinook salmon is about 10 per cent lower than that of last year. This is the only article so far as to which an opening price has been named that is quoted lower than that of 1924 opening price.

Canned Salmon has not been selling very well on account of the cool weather.

California Canned Fruits—California canned fruits are in very good demand, especially is this the case in relation to yellow cling peaches and higher grades of canned apricots. Both yellow cling peaches and apricots are scarce in the higher grades.

It is reported by the several dried fruit packers' and growers' associations that the crop of California apricots and California peaches is likely to be smaller this year than last, on account of the early drought and the low stage of water in the big irrigation reservoirs in California. One of those associations reports that the ground has been tested in a number of fruit-growing localities and found to be bone-dry to a depth of 18 feet, owing to the lack of rain and insufficient irrigation.

Other Fruits—Michigan reports a likelihood of a good crop of cherries this season, and Arkansas reports the prospect of a good crop of peaches. There are very few peaches packed in Arkansas, as the growers do not furnish the proper fruit for canning purposes. They grow principally Elbertas or yellow free peaches, which are not very suitable for canning purposes, and are not salable in competition with California yellow cling peaches.

Cold-storage warehouses here and elsewhere throughout the United States are packed full of apples in barrels and boxes. And there is, therefore, very little demand for canned apples. The crop prospects for apples for 1924 are not sufficiently advanced yet for a prediction or estimate. If it is reported later that there will be a good crop, it would be very inadvisable for canners to pack many apples in No. 10 cans, as the cold-storage proposition will effectually prevent the canned apples from selling, as they are used almost exclusively by pie bakers, and such bakers prefer the barrel stock. If there is a good crop of 1924, barrel stock apples are likely to be exceedingly cheap.

ST. LOUIS MARKET

Prices Irregular—Fruits and Vegetables Firm—Fish Weak—April Distribution This Year Behind Last April—Standard Corn Dull, Fancy Firm—Tomatoes Quiet—Peas Are Too Scarce to Make a Market—Asparagus in Good Demand—The Market Quotations.

St. Louis, May 8, 1924.

By "Missourian,"
Special Correspondent "The Canning Trade."

PRICES Irregular—An inactive market continues here, and prices are irregular. The statistical position is firm, however, and while in certain lines there have been declines, in others there are tendencies to advance. Canned vegetables are generally firm, and so are canned fruits. In canned fish, however, there is evidence of weakness in certain lines, particularly salmon.

Comparing the April distribution of canned foods this year with the same month a year ago, there was a falling off noticed during the entire month. As the month progressed, business continued to fall, off and the last week of the month was one of the dullest that was experienced for some time. On every item in the list purchases were small, and when purchased they were only for immediate needs. It did not matter whether the item was scarce and the price going up, or whether there were plenty on the market. Spot stocks have the preference. In fact, the market was very indifferent, and there was no encouraging indications to warrant the belief that there will be any change in the immediate future. Judging from the attitude of futures, there is every indication that the trade is going to operate as it has been doing in the past, very conservatively, for some time to come. Some brokers say the largest operators are more conservative than the smaller ones.

Corn—Standard corn is dull, but fancy is firm. This is owing to the cleaned-up condition of the market. The demand is better, however, on the fancy than on the standard. Both standard and fancy are picked up as they are needed' and standards from both the South and Middle West are taken in small quantities only.

Tomatoes—A quietness prevails in tomatoes, with 2s leading in interest and firmness. There is more or less pressure to sell, more so by second hands than by canners. There are some packers who seem to be in need of cash They are shading under the established factory prices, but the larger canners are selling as outlets permit. Futures remain at former levels, but they are not being taken freely.

Peas—The best selling lines of peas are scarce, and they can only be obtained in a small way, in resales. Other grades are offered, but they do not attract much attention. Spot supplies are closely held, and they represent badly broken assortments. The demand is mostly for standards of the larger sizes Retailers want packs which can be offered at popular prices as in other lines. Little is offered on contract, as most canners are booked up to the extent of their anticipated pack.

Miscellaneous—Asparagus is in better demand. Spot stocks are given the preference, although there is a freer buying from packing centers, when desirable offerings are made. String and stringless beans are particularly active, both spot and futures Succotash, beets, limas and spinach only have a fair call.

Fruits—The California fruit demand is fairly maintained. Distributors are taking on supplies of cling peaches, particularly in standard grades. They are doing this more freely than any other time since the first of the year. Because stocks of California fruits in packers' hands are reduced to a very low point and prices are advancing, has stimulated buying considerably. There is a fair call for apricots and pears, but less attention is being given to cherries Berries and prunes are also in demand. There is more activity in futures, particularly in the Northwestern packs. Gallon apples are not in much demand, because fresh fruit is still very plentiful. Jobbers are not buying for use later, although there is an advancing market and supplies are more difficult to locate.

Staple grades of canned foods, in carload lots, f. o. b. at points of shipment, are quoted as follows:
Tomatoes—

No. 2 Standard, Indiana	$1.20
No. 3 Standard, Indiana	1.70
No. 10 Standard, Indiana	5.45
Corn—	
No. 2 Fancy Crosby, Minnesota	1.40
No. 2 Fancy Gold Bantam, Minnesota	1.95

CALIFORNIA MARKET

Troubles From the "Hoof and Mouth" Disease Clearing Up—Strawberries Plentiful—Shortage in Stocks Is Becoming Noticeable—Pea Pack Will Be Light— Rain Is Needed for Asparagus—Cherries in Better Demand—Report of Packing Corporation Satisfactory.

San Francisco, May 8, 1924.

By "Berkeley,"

Special Correspondent "The Canning Trade."

THE Trouble Clearing—Business is still being adversely affected by the hoof and mouth epidemic among livestock, with the resulting quarantine regulations and embargoes on many products of the soil. The situation is gradually clearing, however, and one by one the communities which have been banning California products are modifying their restrictions. The markets of this State cannot care for the fresh products that the being produced, and quite serious losses have been incurred in some lines. These are small, however, in comparison to those that might result should the epidemic continue through the fruit season. The embargo on shipments of food supplies to the Hawaiian Islands has been lifted and shippers have resumed trade with the Islands, which has been banned for some time. The lifting of the embargo is permitted providing all products are fumigated, that they originate in non-infected parts of the State, and that new containers are used. Other communities have modified their restrictions, and there is a wider movement of fruits and vegetables than in some time.

Strawberries—Strawberries are in good supply in the San Francisco market, and several canneries are operating on this fruit in a small way, taking the surplus from fresh fruit operators. The Imperial Valley crop has about been harvested, and from now on the supply will come from nearby districts. Most of the berries received to date have been of fine quality, there having been no rains to cause spoilage. A larger proportion of the crop will be handled by canners this year than usual, owing to restrictions on shipments.

Stocks Short—The shortage in the stocks of California canned fruits is becoming quite apparent, and buyers are compelled to shop around to secure even small assortments. Standard cling peaches are being held at $1.90, and even more, and holdings are limited to a few operators. For choice some packers are asking $2.35. Opening prices on the new pack are not expected for some time, but many in the trade anticipate that they will be on the basis of present spot prices; at least, on peaches. In fact, the California Packing Corporation has guaranteed its present prices on Del Monte fruits against its formal opening prices. Seconds and water goods are especially difficult to locate.

Peas—The packing of peas will soon be under way in the San Francisco Bay district, but the output cannot but be light. The acreage was reduced, owing to the drought, and this condition is responsible for the poor yield of the fields that were planted. The expected pack was disposed of soon after the announcement of opening prices.

Asparagus—Rain is badly needed in the asparagus-growing districts, and the season will probably be a short one, unless there are showers in May. A good pack is being made as shipments to the produce markets are being restricted, but a market is available for all that can be packed. This is one instance where the embargoes on California products is not affecting growers.

Sherries—A better demand for canned cherries has been noted during the past month, and stocks of this fruit, which were considered top-heavy for a time, have become quite light. Canning operations will be commenced shortly, as the fruit is now moving to the Eastern markets in carload lots.

Salmon—Most packers continue to hold stocks of pink salmon at $1.25, but some sales have been made of late on the basis of $1.20, f. o. b., Seattle. Opening prices have been announced on Columbia River chinooks and bluebacks, on the basis of $2.20 and $2.30, respectively, and considerable business has been booked, although the carryover pack is still receiving the most attention. Prospects are not especially bright for a heavy pack in Alaska, owing to the restrictions on fishing made by the Federal Government and to labor troubles.

Coast Notes—The annual report of the California Packing Corporation, issued the last of April, indicates that this concern has had a very good year. Net earnings amounted to $11.27 a share on 471,708 shares outstanding and $5.27 a share was added to surplus, bringing the latter up to $19,299,337, or approximately equal to the $20,000,000 capitalization of the corporation. During the fiscal period which ended February 28, 1924, all notes outstanding at the beginning of the year were liquidated. As of March 1, 1924, there were no bills payable outstanding. In his annual report President R. I. Bentley said: "The consolidated income account shows that the operating profit is less than a year ago, largely due to the fact that the pack, including allied companies, was less than the previous year. The carryover stock of canned foods is larger than a year ago, but this statement is made without regret, for all materials are higher this fiscal year than the past. Inventory valuations are, as customary, at factory cost or market basis, which ever is lower. Under the conditions prevailing there is a good margin of profit in selling this stock, approximately 30 per cent of which has been sold since the close of the fiscal year. We have no comment to make on the balance sheet, other than to call your attention to the fact that there are no bills payable outstanding, and at this date, having packed approximately 650,000 cases, we have not been obliged to resort to such interest-bearing obligations, but have been able to operate on our own funds. Repairs and renewals have been written off as usual, and $1,188,513.64 set aside to cover depreciation.

"While it is reported that general business conditions are slowing up, we are gratified that our own business to date is considerably in excess of the previous year. Having confidence that our advertising program, with the work that must accompany it, spells success, we have increased our appropriations for this purpose. The statement of the Alaska Packers' Association is made a part of this report. As predicted, the pack is less than that of the previous year, with corresponding profits. We are hopeful that the results for 1924 will be at least as good as 1923."

The California Olive Association held its annual meeting at San Francisco late in April and chose officers for the ensuing year, as follows: President, Frank Simonds; vice-president, C. R. Cooper, and secretary-treasurer, J. J. Hoey, of Los Angeles.

Joseph Durney, head of the Griffith-Durney Co., San Francisco, has returned from a business trip to New York.

William H. Long, representing Libby, McNeill & Libby, is a visitor at the San Francisco office from Chicago.

Eugene M. O'Neill has been made selling agent in the San Francisco field for the Winters Canning Co., which has a cannery at Suisun, Cal.

SEATTLE MARKET

Salmon Packers Fight Censervation Bill—The White Bill—No Fixed Price Set—Fishermen's Union Is Causing Trouble—A Strong Market Prevails.

Seattle, May 7, 1924.

By "Nomlas"

Special Correspondent "The Canning Trade"

SALMON packers are greatly concerned over the salmon conservation bill now before Congress, and they are continuing their fight for modification of the provisions of this meas-

ure. It is felt that if the bill goes over as advocated by some legislators, the salmon canning industry will be dealt a very serious blow, and the pack materially curtailed on both pinks and reds. Packers operating extensively in the Bristol Bay territory are particularly affected by the White Bill, which proposes further regulation of canning and fishing in Alaska. E. S. McCord, attorney representing a number of the salmon canners, is now in Washington looking after the canners' interests. "The packers all believe that there ought to be restrictions on salmon fishing," he says in commenting on the situation, "I have always believed that salmon are being rapidly depleted and that the United States ought to have power to restrict or prohibit entirely for a limited period fishing for salmon to an extent necessary to save the salmon. There ought to be a law with flexibility. All packers are willing to have power conferred on the Department of Commerce, but they don't want a fixed inflexible law that cannot be modified to meet constantly changing conditions."

Reluctant to Name Prices—As a result of the uncertainty over the fate of the salmon conservation bill, as affecting fishing restrictions for the present season, salmon packers are reluctant to book firm at fixed prices. Some business has been taken at $1.25 on pinks and $2.25 on reds. If the conservation bill passes with the more drastic restrictive povisions, however, it is more than likely that the largest factors will be quoting $1.50 on pinks and $2.50 on reds for the new season's pack.

S. A. P. Sales—One prominent packer, in discussing the situation with his selling agents, says: "We want all of the S. A. P. business you can get for us, but until such time as we have determined on a definite selling policy, so far as terms and conditions are concerned, please book such business for our account on the following basis only:

> "S. A. P. (our regular contract) guaranteed against Alaska Packers' Association and Deming & Gould opening prices; guaranteed against Alaska Packers' Association, Deming & Gould and our own decline to date of shipment, and subject to buyer's approval of our terms and conditions when named."

New Chinooks—Opening prices have been named on new pack fancy Columbia River Chinooks on tbe hasis of $2.10 per dozen for halves and $3.60 for ones, with ½s bluebacks offered at $2.30 per dozen. There has been a moderate movement on the basis of this opening.

Spot Salmon—Buying has picked up somewhat, and shipment are growing larger as the trade in many parts of the country comes in for its spring requirements. Reds have worked up to $2.30 per dozen on the miscellaneous brands, while the leading brands continue firm at $2.35 per dozen. Pinks ren in unchanged at $1.25 per dozen, and chums are nominal at $1.20a $1.25 for the small lots still available. A cleanup of all chum holdings by the time new pack is available is assured according to many factors in the trade here.

Labor Trouble—Many of the Alaska packers have had difficulty with their union fishermen this year, and a number of ships are going noth carrying non-union cannery crews.

Market Strong—All in all, the market outlook appear to indicate firmness on all grades, with a possible further strengthening on reds, and possible an advance of 2½ to 5 cents per dozen on pinks in the near future.

MAINE MARKET

Sardine Packers Await the Coming of Fish—Clam Season Draws to a Close—Packing of Lobsters Slow in Starting—Both Spot and Future String Beans Cleaned Up—A Similar Situation in Corn.

Portland, Me., May 9, 1924.

By "Maine,"

Special Correspondent "The Canning Trade."

SARDINES are prominent in their absence. Although the law states plainly that they may be canned after April 25th, the fish remain in hiding, and there is no hope of getting into full swing for the season's work before the middle of June at best. Possibly five factories, all in the eastern section, have begun operations in a small way, but even these few lack fish for a regular run. The factories in Casco Bay, the Portland section, have received no fish at all as yet, although they are ready for work and anxious to begin.

The price was opened this year at $4.35 for standards, with the feeling that this was the absolute low limit and therefore must be upheld. But the trade, instead of appreciating this condition, have concluded that such a drop must mean anxiety on the part of the canners to move their goods and are therefore still waiting for a new low figure—which simply can not be named. With fish at $12 and cans advanced, the costs are so high now that $4.35 does not allow the sardine canner a minimum profit unless he is able to do a tremendous business and move his goods for a quick turn-over.

Clams are about done for the spring season, although several factories will no doubt run until the 15th to 20th of this month. During this latter part of the season clams have been coming to the factories in better volume, and the pack has been sufficient to take care of present contracts and assure some spot stock for summer orders. The price has held at $1.30 and there is every reason to suppose that this will be strongly maintained on the spots, owing to the light quantity carried in first hands.

Lobster factories are trying to get started for the summer's work, but it is very slow in opening up. Prices quoted are very reasonable, running from $4.25 to $4.60 for halves, $8.00 to $8.60 for pounds and $2.32½ to $2.75 for quarters. No new goods have come to the market yet, although they will be shipped in as fast as sufficient quantity can be produced.

Stringless Beans are cleaned up, the spot stocks being lacking since last August and the futures all booked on contracts for delivery as packed. Although the weather remains cold and somewhat dull, vegetation seems to be advancing almost as usual, and there is more promise of a normal planting. Under market conditions there have been no deviations from the original opening price of $1.30 and $6.00 for 2s and 10s, except where fibre cases are acceptable or similar conditions obtain.

Corn is also well sold, and will not be offered further until after planting time—normally from May 20th to June 10th. Several of the prominent canners report that they already have all the business they will want this year and that they do not mean to add to their acreage. Others who have not sufficient acreage signed up to tax their capacity will take on more and will then have some corn to sell or to hold after canning. This is a healthy condition and promises well for 1925 also. Corn prices have also remained firm at the opening quotations, $1.45 for Crosby and $1.70 for Golden Bantam.

What The Brokers Say.

Baltimore, Md., May 10, 1924.

The situation in futures tomatoes has resolved itself to a stand-off, apparently between the buyers and canners alike. The canners declare they have scaled their production figures as far down as they dare in order to stimulate business, while on the other hand, the lack of orders this week seem to indicate the buyers have substantial and logical reasons to believe that conditions as they view them make it imperative that the pruning knife be driven deeper by the canners before they feel safe to buy again in a big way. The canners would welcome a medium that would enable them to reduce prices and at the same time permit the making of good quality in order to meet the buyers' ideas, but the door of further opportunity to do so has been closed to them, because of the fixed prices of accessories, etc., wich they had no part in making and which they are powerless to change, to meet the shifting conditions and sentiment of the day. It must be remembered the canners have concrete visible evidence to guide them, while the buyers are basing their opinion on simple deductions of basic conditions present and future. Perspective reasoning offtimes vields a spectre that never exists and this year may prove no exception to the rule. Regardless of all ifs ands or buts in the game, the outstanding principle to be reckoned with is the coming crop, whether the yield will be large or small, and the intending buyers might take a grain of encouragement from the fact that last year, even during the glut period of a bumper crop, prices did not decline below today's quotations for future tomatoes. What will happen if the crop turns unfavorable need not be discussed in a large way; the answer is obvious. Futures tomatoes look safe to buy, hazards considered.

The big activity in spot tomatoes has not come as yet. The buying this week was irregular, both as to the size and quantity of orders. They will, however, be cleaned up bv the time the new canning season rolls around, without a doubt. A slight increase of orders little or big will surely send the prices upward. Watch them carefully, especially the No. 2 size. The present prices are the product of slack trading rather than heavy stocks.

Thomas J. Meehan & Co.

What Canned Foods Distributors are Doing

Attempt of Chicago Meat Packers to get Consent Decree Set Aside Worrying Grocers—Court Affirms Manufacturers' Right to Sell Wherever and Whoever He Pleases—National Arbitration Law Before Congress.

ALTHOUGH convention time for the two great wholesale grocers' organizations is at hand, the chief topic of conversation among jobbers continues to center around the packers' consent decree, and the possible return of the "Big Five" into the wholesale grocery business as buyers and distributors of canned foods, dried fruits and other grocery products.

J. W. Herscher, president of the National Wholesale Grocers' Association, in a summary of the situation, says that the setting aside of the Consent Decree would give to the packers, with their predominance in meat products, their branch houses throughout the country, their "peddler" cars, and preferential refrigerator car service, and their great control over markets through command of vast capital, virtual control of the price of every article on the table of the American consumer, as found by the Federal Trade Commission. He quotes William C. Breed, attorney for the Association, who claimed that the attempt at this time of Armour and Swift to set aside the decree amounts to a failure to keep faith with the court, since they now claim that the decree was void from the beginning; with their co-defendants who have complied with the decree; with Congress, which eliminated from the Packers and Stockyards Act matter which dealt with the decree, and with the United States Government, which in 1920, after two years of investigation by the Federal Trade Commision and the Attorney General, abandoned further action and agreed to the Consent Decree.

In answering the arguments of the packers to the effect that the court had no jurisdiction to enter such a decree, because of a stipulation to the effect that the consent should not be construed as an admission of guilt or an adjudication that the Sherman Law had been violated. Mr. Breed directed the court's attention to the fact that the Clayton Act itself contains provisions that if parties to an anti-trust suit consent to a decree, it should not be deemed an admission or adjudication. These provisions in the Clayton Act were designed to prevent Consent Decrees from being used by outsiders in triple damage suits, and but for such provisions it would be impossible for the Government ever to secure any Consent Decree from a violator of the law.

It was also contended by Mr. Breed that by its very nature a Consent Decree is a settlement by the parties; that such a decree by its nature is not an official adjudication of guilt, but is an implied admission by the parties that the decree consented to is valid and that the court had jurisdiction. He called the court's attention to the fact that the Sherman Law itself was enacted in 1890, after an investigation by Congress of the domination of the packers, and that for thirty years Congress and other agencies of our Government have been attempting to regulate these interests.

"As you know," says President Herscher, "with the exception of the Armour Co., the packers have complied with this decree. That company has applied to the Supreme Court of the District of Columbia from time to time for extensions of time within which to dispose of its interests in the so-called unrelated lines. The last extension of time expired on December 27, 1923, and Armour & Co. then petitioned the Supreme Court for a further extension, which was denied by Judge Bailey. In denying this application for additional time, Judge Bailey said:

> " 'It is true that such orders as that now asked for have been heretofore made in this court, but I do not feel justified in making any further orders of this character, especially in view of the fact that four years have elapsed since the entry of the original decree.'

"Since that denial by Judge Bailey the Armour defendants have again petitioned the court for an extension of the time which expired in December last. Your association has filed an answer to this latest petition, and to date there has been no decision by the court."

The American Wholesale Grocers' Association is also a party to the present proceedings, and is lined up with the National Wholesale Grocers' Association in fighting the packers. It is probable that the attempt of the packers to return to the grocery field will be one of the outstanding problems discussed at both conventions this month.

Buying Exchanges—The United States Circuit Court of Appeals for the Second Circuit has set aside and reversed the orders of the Federal Trade Commission made last January, and designed to compel the National Biscuit Co. and Loose-Wiles Biscuit Co., with other manufacturers, to sell to buying exchanges and other pools. The decision was based on an opinion by Judge Manton, in which Judges Hough and Mayer concurred. The court's determination accords with a number of other recent decisions, upholding the right of a manufacturer, wholesale grocer, or any other merchant freely to exercise his own discretion in both buying and selling. He may refuse to trade with anyone, as he may see fit, for any reason whatever, provided always he acts independently.

Arbitrations—Members of the wholesale grocery trade are supporting H. R. 646, introduced in the House of Representatives by Congressman Mills, and already favorably reported by the House Judiciary Committee. The bill proposed that a written provision in a contract involving interstate or foreign commerce to arbitrate controversies arising under such contracts, or an agreement to arbitrate any dispute under such contract, shall be valid and enforcible, save on such grounds as exist in law or equity for the revocation of any contract. The principles involved in the measure are in line with the arbitration policy of the canners, brokers and wholesale grocers at the present time.

Frank C. Letts Dies—Frank C. Letts, president of the National Grocer Co., Western Grocer Co. and the Durand-McNeil-Horner Co., died at his home at Lake Forest, Chicago, on May 2. He was one of the pioneers of the wholesale grocery trade and one of the outstanding figures of the industry. He developed many innovations in selling practices, and any systems or figures of his companies were always open to competitors where the general upbuilding and welfare of the wholesale grocery business could be encouraged.

Wants Lower Rates—Ross P. Seaton, secretary of the Illinois Wholesale Grocers' Association, discussing the question of tax reduction. says: "Now is the time to send your message to Congressmen, Senators and the President. We hope you will ask the representatives how much they expect to reduce taxes in this session and what plans they have for making the reduction as permanent as possible. In other words, what appropriations they propose which will offset all the savings they claim can be effected. The President should be encouraged to maintain his position of opposition to all increased appropriations and we should support and encourage his endorsement of the Mellon Plan, or any plan which will give maximum and permanent tax relief."

The Illinois Wholesale Grocers' Association will meet during the progress of the National Wholesale Grocers' Association convention late this month at the Congress Hotel, Chicago.

Indiana Jobbers Meet—The annual convention of the Indiana Wholesale Grocers' Association was held at Evansville last week, outlining his Triangle Stores Advertising Club plan, facturers' representatives at the meting. Fred N. Pitcher, secretary of the Association, arranged a wide and varied program which aroused considerable favorable comment.

Jobber-Retailer Co-operation—C. W. Linthicum, secretary of the Arkansas Wholesale Grocers' Association, spoke to wholesale grocers and retail grocers at a meeting in Jonesboro, Ark., last week, uotlining his Triangl Stors Advertising Club plan, designed for closer jobber-retailer co-operation to better meet the chain store competition.

Outstandings—E. A. Carter, secretary of the Alabama Wholesale Grocers' Association, reports outstandings ranging from 57 per cent. to 261 per cent. for March, the report covering the operations of 30 jobbing houses in his territory. The average for March was 137 per cent., as compared with 148 per cent. in February and 136 per cent. in January.

Specialty Orders—Prompt and careful attention to specialty orders, backed by the seal of the American Specialty Manufacturers' Association, should be given by wholesale grocers, said W. W. Frazier, Jr., president of the American Specialty Manufacturers' Association, in an address before the Virginia Wholesale Grocers' Association at its recent convention.

THE CANNING TRADE

THE JOURNAL of the CANNING and ALLIED INDUSTRIES

Established 1878

PUBLISHED EVERY MONDAY BY

THE TRADE COMPANY

ARTHUR I. JUDGE - - - - - Manager and Editor

107 South Frederick St.

Baltimore, Md.

Telephone Plaza 2698

Packers are invited and requested to use the columns of THE CANNING TRADE for inquiries and discussions among themselves on all matters pertaining to their business.

Business communications from all sections are desired, but anonymous letters will be ignored. ARTHUR I. JUDGE, *Editor.*

THE CANNING TRADE is the *only* paper published exclusively in the interest of the *Canned Food Packers* of the United States and Canada. Now in its 47th year.

TERMS OF SUBSCRIPTION.

Payable in advance, on receipt of bill. Sample copy free.

One Year,	$3.00
Canada,	$4.00
Foreign,	$5.00

Extra copies, when on hand, 10 cents each.

ADVERTISING RATES—According to space and location.

Make all Drafts or Money Orders payable to THE TRADE CO.

Address all communications to THE CANNING TRADE, Baltimore, Md.

Entered at Postoffice Baltimore, Md., as second-class mail matter.

Vol. 47 BALTIMORE, MAY 19, 1924 No. 39

EDITORIALS

THE ANNUAL LESSON—Every year the canning industry goes to the same old School of Experience in which there seems to be but one grade and that the kindergarten, all higher classes having been discontinued for the lack of students. Each year finds some new additions to this kindergarten class, but never a graduate, and it has been so since Nicholas Appert added this branch to the curriculum of the School of Human Experience.

This year, last year and for years running into the misty past, the canners looked out over the snow-covered fields of January and saw unlimited areas of growing crops, flourishing as never the Bay tree ever dared flourish, with yields of the finest, unharmed and of finest quality; saw these crops rolling into their factories in orderly array, not too fast and not too slowly; watched them pass through their well equipped and smoothly working plants into the waiting cans to supply the hungry horde of insistent and never satisfied buyers clamoring outside their factories. Somehow some way crops would be "just fine" as ex-President Jimmy Anderson used to say; and they would be canned at ever lowering costs, while selling prices would keep steadily mounting. But no, may be prices will not be so good; another buyer has bought his futures and he may be the last one needing them—better sell a fair amount of this expected large output, even if it shows a loss. Be on the safe side and don't get caught with the warehouses loaded up next fall. The price on futures is low, but everything is going to work like greased lightning in the factory this year, and may be we can save in the cost, here and there, without cutting the quality. We'll get by!!

Every year, year after year, preparations for the next pack upon an immense scale; the country scoured for every grain of seed that can be found to plant every acre available. And every year good old Dame Nature has kindly stretched out her hand to save these children from harm.

Ex-President Walter J. Sears waged valiant war to have "Crop Hazard" included, by the Government, in the costs of canning. He might better have sought Government insurance against failure of crop hazard, for the absence of that hazard might easily mean the ruin of the industry.

A lot of futures have been sold against the 1924 crops, on the basis above pictured, and some are even willing to sell them below cost now, on the strength of this picture. But will Dame Nature again take care of them? It looks like she might do so, but it is a long time to harvest. However, she has delayed the season; sent drought and frosts in some sections, the Pacific Coast, particularly, too much rain and unfavorable weather in most all heavy canning crops sections; floods and damages in others, as in this immediate section where fields have been washed down to the rock foundations, and canneries washed away in swollen rivers and streams. And she withheld a sufficiency of frost in this section to lighten and open up the ground so that the overabundant water supply might soak in and be conserved. She seems to be at work to keep the canners' dreams from coming too true—for the kindergarten class must not graduate to the higher one of experience. But she should not be presumed upon, and the man who sells futures below cost now will not be entitled to pity or compassion when prices next fall are very much higher, and the buyer who refuses to cover his wants, at least moderately, because he has listened to the tales of increased production during 1924 is just as foolish and unbusinesslike. The gamble is all in favor of the canner, because stocks are depleted as never before and the world is still hungry. We heard an old student of conditions say, with a warning shake of his head: "watch out for this year's crops! It's a poor crop year."

THE TRI-STATE MEETING—The word-picture of the business meeting of the Tri-State Packers at Wilmington last week, reproduced in this issue, does not tell the whole story. Those who are not familiar with the leading canners of this section; who do not know the size of their plants, or of their yearly packs, but who picture this entire section as overrun with a horde of small, inexperienced, under-financed tomato canners, with dilapidated factories, packing a few thousand cases at most of poor quality goods—in a word those who live in the past, twenty years ago, can-

not see things as they really are. They forget that times have changed; that factories have been rebuilt or improved and enlarged, and that there has come with these changes a vast improvement in quality packing.

All the $1.65 per dozen standard No. 3 tomatoes are not sold in Indiana or California. They ought to know that the vast majority of these canners now are up and going; selling annually a big portion of their increased outputs to buyers who know they can depend upon the quality, without price question. The section suffers from the bargain hunters, among both buyers and brokers, who play-up the poor canner, both in finances and in ability to pack quality, who grab the forced offering of a small, unfortunate canner and run around waiving it in the face of the whole market as if it was the offering of the whole section and of the best canners, instead of an isolated, exceptional, the-poor-always-with-us offering as it is. The real men of the industry were present at that meeting; they are planning and putting through the biggest thing in improved crop production yet attempted, as they did last year, and they are packing and intend to pack a quality which the buyers know is high, and the kind which brings consumers back for more. And they are not worried because there are some poor packers in their midst, nor bothered by the yapping of the bargain hunting dogs who are always on the chase. Those men believe that this Tri-State section can produce the finest tomatoes in the world; the finest flavored; the kind which the people prefer, and they are going to pack them so carefully that trade will be forced to them. These men have grown tired of the slurs on the Tri-States and they are going to sort out the goats from the sheep. The war is on, both at home and abroad; at home to put what poor canners there may be in the class where they belong, and abroad to herd with them those interests which have been the cause of the bad reputation, the price-buyers and bargain hunting brokers. They said they know there are plenty of fine, reputable, high-class brokers, patronized by fine, reputable high-class buyers and they intend to deal with them, leaving the muck among canners and brokers and buyers to themselves. That is what the meeting meant to the men who were there, and we believe they are going to carry it out; because the buyers want to deal with first class men, brokers as well as canners, and they know the the condition. If they ever want a lot of poor goods, for poor trade, they will go slumming among the slums. And this is as it should be.

"ED" SMITH DIES IN HOSPITAL.

MR. EDWARD SMITH, well-known head of the Esmeralda Canning Co., Circleville, Ohio, and one of the oldest corn canners in the west, recently went to a hospital in Columbus, Ohio, for a minor operation, but died under the effects of it on Tuesday, May 13th, and was buried Thursday, May 15. Mr. Smith was a figure in the corn canning game. Back years ago, when canned corn was selling closer to 50 cents than it does today at $1, Mr. Smith was hopeful of it, and his one cherished wish was to see it sell at $1. He lived to see his dream come true, and he probably sold many thousands of cases at that or a better price. He was a quiet, gentlemanly man who made many friends, and his passing will be a cause of sorrow to a wide circle. With him goes one more of those fine old men who helped make the early history of canning, and his familiar face will be missed at coming conventions.

A NEW LINE OF CANNING MACHINERY.

FROM out the west comes a new line of canning machinery and one which promises to attract as much attention throughout the balance of the country as it has on the Pacific coast. The Anderson Filling Machine Company, whose plant and offices are in Alameda, across the bay from San Francisco, in California, burst on the attention of the industry in a two-page display advertisement last week, as you doubtless noticed. And they evidence their acquaintance with this industry by showing some of the leading canners of the coast who are large users of the machinery they wish to bring to the attention of the eastern canners. That is one thing the experienced canner wants to know: has anybody used it; is it being used, where, by whom and with what results? And this advertisement was directed to answer all those questions fully and at once. Not only were the firms using it named, but views of their plants shown, displaying the machines "in line."

The Anderson Filling Machine Co. have long built machinery for the salmon canners, and for the past two or three years for the fruit and vegetable canners. They have gone slowly, carefully, and been sure that the offerings would do all that was promised, and more—in a word, that the machines were "right" before they were let out. They apparently have proved all these points, and are now ready to take orders from canners anywhere, and they have some attractive machines. Their aluminum exhausters, so named because it is made of aluminum, is the machine which caused the present general discussion on the "long, low exhaust," and its value. That is its specialty, we believe, a long, low-temperature exhaust, but with an immense capacity. In this week's issue they show Anderson filler, on which they make strong claims. This filler seems to handle tomato and sauerkraut in a way to pease those canners, and it will fill most anything else, we believe. It is simple, positive, and fills each can exactly alike. Another machine is the non-agitating continuous cooker, the name tells its own story, and it will find ready listeners among many the continuous cooking of the goods as they come from the seamers, without shaking or rolling. They claim tomatoes need this kind of treatment, rather than shaking or rolling, which tends to mash the fruit. And may be other canners will see much in this. The line is an attractive one and worth looking into.

They offer to lease the line, a novelty in a line of machinery, and a thing we don't like. It is all right if they want to do it; they must have a barrel of money, but we'd rather see the canner own all his machinery and feel responsible for it. They would be more careful with it, and results would be better. But this makes it easier for the canner, and we fear they will be swamped with requests and orders.

Four Models Twelve Sizes

There's a style and Size of Peerless Exhausters to meet the requirements of every canner, large or small.

PEERLESS DUPLEX EXHAUSTER.

Of these, the Duplex style, shown in the rear of the above group, is recommended for the canner who wants to lengthen the time of his exhaust, so that a product which is slow to absorb heat will be really hot when discharged, and yet handle enough cans per minute to keep a line real busy.

Some Advantages of Peerless Duplex Exhauster.

1 Cans never permitted to get away from the steam.
2 A long, slow, penetrating heat.
3 Discharge of the products at just the right temperature.
4 Tremendous capacity in small floor space.

Whether you install a Duplex or a Single model, you will find that Peerless Exhausters will pay for themselves by saving steam and cans, and eliminating "swells".

Write us today for full particulars.

Some Pointers For Tomato Pulp Packers

By Charles H. Stephenson
Bureau of Chemistry, U. S. Dept. of Age.

THE 1924 tomato season will soon be upon us. For that reason we will review a few points that should receive the attention of some pulp packers. An inspection of a number of pulp, catsup and paste packing plants which I made during the season of 1923 revealed some conditions which are far from ideal. At the expense of repetition, therefore, some of the more commonly found defects will be considered here.

Irregular Dumping of Tomatoes—Irregular dumping is a very common fault. Sometimes tomatoes are emptied into the washer or upon the sorting table at the rate of 400 to 600 bushels per hour, thus passing before the sorters in such quantities that proper sorting cannot be done. After a few moments of such excessive dumping, the other extreme is reached, and no tomatos will be handled often for a period of five minutes or more. During such periods the sorters are idle.

It is highly desirable to use some system which insures regularity of flow of tomatoes over the sorting belt for every moment of the working day. In this connection the installation of an endless conveyor, which runs to the washer and is supplied with buckets which hold a known quantity of tomatoes, is suggested. The speed of the conveyor can then be regulated so as to deliver 120 bushels in one hour as a maximum, delivered with absolute uniformity to the washer, and thence to the sorting belt. If the capacity of the plant is 240 bushels per hour, then, of course, two belts will be needed to take proper care of the product.

If a soaking tank is used, the size and spacing of buckets or cleats and the speed of the conveyor from it should be so regulated that not more than 120 bushels per hour will be carried from the tank to the sorting belt.

Large buckets tend to dump the tomatoes in piles on the belt. Hence the smaller the buckets used the more uniform will be the distribution of the tomatoes on the sorting apron.

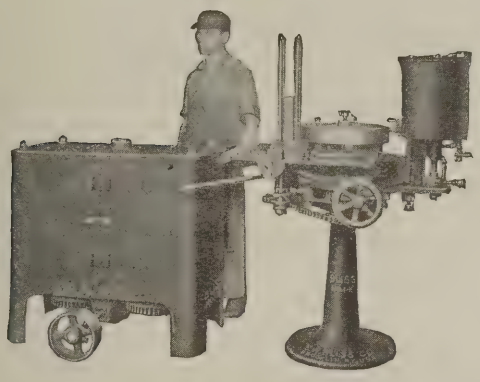
It is necessary to have some device, such as paddles or a small propeller, in the tank so that a current will be set up, thus maintaining a steady supply of tomatoes around the conveyor at all times. We believe that some such arrangement will go far toward solving this very bad feature of irregular feeding which is all too common at the present time.

Washing—Tomatoes caked with clay are not the easiest things in the world to clean and a good washing outfit is necessary. A preliminary soaking tank is very helpful as it loosens the dirt and helps to insure clean tomatoes after they have gone through a good washer, such as the rotary or any other type that has been found to give satisfactory results.

In 1923 one firm made trimming pulp, although it was equipped only with an old-fashioned dump scalder, the water being changed twice each day. A clean trimming pulp cannot be made with a dump scalder handled in any such manner, if indeed, it is ever practicable to make it.

In too many plants the force is so weak that the water merely trickles onto the tomatoes. Unless the water has enough force behind it, it will not clean the soil from the tomatoes. Some packers use a force pump, which gives a water pressure of 50 pounds or more per square inch. We are strongly in favor of washing tomatoes before the main critical sorting is attempted. Although preliminary sorting is possible before washing to remove the almost totally decayed tomatoes, when the fruit is covered with sand and clay it is almost impossible to make a good job of the sorting. Some plants still do most, if not all, of the sorting of tomatoes by the dry system, but the results that they obtain are usually not as satisfactory as those by the wet system.

Sorting—Sorting cannot be economically done without the proper adjustment, nor efficiently done with indifferent or too few sorters. Too many pulping plants at this late date have not given proper attention to these details. The picking belt should be 10 feet long, at the very least, so as to accommodate three sorters on each side. Some belts have a space of only two or three feet which provides for but two sorters at the most, one on each side. In addition to this, steam may be escaping from the scalder so as to make the sorting at this place almost impossible. When trimming pulp is made, tomatoes should always be thoroughly sorted before scalding. Again many belts are in dark places, little thought apparently having been given to securing either natural light or artificial light which should be provided for dull, dark days.



As for speed, some belts still run 50 or more feet per minute, which is altogether too fast for proper sorting. From 20 to 25 feet per minute is a good speed for sorting belts.

Some belts are inclined upwards at such an angle that the length of belt, which is at a convenient height is long enough to accommodate only one sorter standing on either side. Platforms must be built by the side of the belt in successive steps. Otherwise there is not enough room for sorters to handle the stock. Inclined conveyors, provided with cleats to keep the tomatoes from rolling back, are also unsatisfactory as sorting belts, since the cleats prevent the tomatoes from being rolled to insure a view of all sides. Horizontal or slightly inclined sorting belts are much more satisfactory.

One sorting belt seen this past season was so low that the sorters had to stoop over to touch it. This is an unusual condition, as most sorting belts, however deficient in other respects, are acceptable as to height.

The proposition of attempting to sort trimmings is fundamentally wrong. With a mixed mass of small tomatoes, skins, cores and pieces, it is absolutely impossible for anyone to remove all the gross rot, not to mention the pieces of soft rot which become mashed, contaminate the whole mass, and cannot be removed. This is the very serious criticism to be made of a system which has comparatively recently gained favor among some canners in certain parts of the country. In this system the scalded tomatoes are carried by a conveyor, usually of impervious material, along in front

of the peelers who pick up the tomatoes, peel them, and drop the trimmings back on the conveyor, which carries them, together with the rest of the unskinned stock, toward the cyclone. Some sorting of this mixed mass is attempted, but usually with very unsatisfactory results. This brings us back to the principle laid down years ago that the sorting should be thoroughly done and that the tomatoes be given a final rinsing to remove decayed material besmeared on the surface before they reach the peelers.

A few of the plants visited last year were attempting this sorting of trimmings. If put on the whole tomatoes these sorters would be very much more efficient. To be used to the best advantage the sorters should sort the whole stock only, never the trimmings.

We strongly favor the designation as head sorter of some person who is alert and keen. This person should be stationed after the other sorters and held responsible for the efficiency of the sorting. If he sees rotten or spotted tomatoes coming past the sorters he should be able to stop the belt until such fruit is removed, or else slow down the rate of dumping.

We are convinced that it is better to have the sorters do nothing but pick out spotted tomatoes and let others trim them, rather than to let the sorters undertake both duties, as a number of packers still do. When tomatoes are coming along in large numbers, with many spotted ones, the opportunity for good work on the part of the sorters is much greater when all they have to do is pick out the spotted decayed stock. A few of the plants observed during the past season were well equipped for pulp making, but no sorting was being done at time of inspection. When this fact was called to the attention of one manager, he stated that sorters were supposed to be on the belt at all times and he would have to ask the foreman why they were not there. The important thing is that all of this time partially rotten tomatoes were going into the cyclone.

It is highly desirable to take samples of the tomatoes that are entering the cyclone and to determine the percentage by weight or number of rotten or spotted tomatoes which have passed the sorters. If more than one per cent of bad, spotted tomatoes is found, the condition can be remedied by adding sorters or by decreasing the rate of dumping of tomatoes.

Microscopic counts are highly important, especially in buying pulp. Care should be exercised, however, to see that the analyst employed has had enough experience to make his results reliable; otherwise such results may be worse than useless. Last season we checked an analyst who was counting from 20 to 80 per cent too low on molds. Yet his results were being taken without question by the superintendent who accepted this as evidence that his sorting was sufficient rather than the evidence of the inspection of the partially rotten stock that could be seen going into the pulp. Tomato pulp should not be held cold in tanks, nor should trimmings be thus held in barrels, as was done last season. A steam pipe should be run into these containers and the product kept at a temperature of at least 140 degrees. Fermentation is bound to occur when such products are held at room temperature. Unless frequently stirred, such products will not be heated uniformly.

U. S. Department of Agriculture Bulletin 569, The Sanitary Control of Tomato Canning Factories, gives a more detailed description of most of the points mentioned here. Copies may be obtained by writing to the Office of Publication, U. S. Department of Agriculture, Washington, D. C.

The average quality of tomato pulp will never be what it should be until more attention is paid to the operations mentioned.

No packer who pays little or no attention to many of the points touched upon in this paper can hope to make a good quality pulp.

Now is the time to prepare for the coming season.

The Tri-State's Spring Meeting

Successful "For Members Only" Meeting—Community Plant Beds Making Good Progress—All Meetings in the Future to be for Members Only.

WHEN it was first announced that the spring meeting of the Tri-State Packers Association would be held at Wilmington, Del., and that only members, both active and associate, would be admitted, there was very considerable comment on the street. It marked the first time that the assembling of this Association was not thrown open that all might profit by anything that was done. Heretofore the so-called free-rider could come up and get as much benefit from the Association as anyone else, and they came, took what was to be had and went their way—and in late years this was a good deal, since the Association, through its friends, the Get Together Committee, has been giving very lavishly, entertainments and luncheons. This big hearted and opened fisted Get Together Committee may continue to give all who come with an equal lavish hand—members and non-members, friends and foes, but the meetings of this Association will be confined to members only from now on. It was so discussed, thoroughly, and then was unanimously voted so at this meeting. And be it said right here that the Association has had a good taste of "business", likes it and intends to have a whole lot more in the meetings to come. This old and reputable Association intends to take itself by the bootstraps and lift itself out of its old reputation; intends to make Tri-States stand for quality and all that is best in canned foods. It says it has the quality produce grown at its doors, and it intends to see that it is packed in the cans in quality style, with all the taste and flavor and appearance that make this garden spot of the country famous. It may even appoint competent inspectors to see that the packs of its members are above reproach and of the quality for which this section might easily be famous. The old past is behind it, and the bright future is ahead of it, and the Tri-States will work to make brighter and lasting in fame this future.

Service Counts

The ability to obtain deliveries in times of stress is one of the determining factors in selecting one's Source of Supply for Sanitary Cans.

Quick and Efficient Service in connection with Double Seaming Equipment is also of the utmost importance.

Our constantly increasing Clientele is convincing evidence that we excel in both of these phases of Can Manufacturing.

HANSEN FRUIT AND VEGETABLE FILLER

Fills Practically Automatically But Produces Hand Pack Quality

Beets, String Beans, Tomatoes, Cherries, Berries, Kraut, Etc.

Adjustable for No. 1, 1½, 2, 2½, 3 Cans. Machine also made for No. 10 cans.

Rockfield, Wis., Nov. 26, 1923.

We are glad to advise that we are very well pleased with the Beet Filler which we purchased from you and used throughout the season. It is a great labor saving device. We used it in connection with No. 2 and No. 3 cans and it gives a good fill. We can only say the best for it.

ROCKFIELD CANNING COMPANY
BY A. J. Klumb.

Sturgeon Bay, Wis., Dec. 1, 1923.

Allow the writer to congratulate you on your Hansen Fruit and Vegetable Filler. As you know, we have been experimenting for the past five years with mechanical fillers for filling No. 2 red sour pitted cherries. Up to this year when we installed two of your fillers, we had never found anything that would operate satisfactorily on cherries but since the success we have had this year with your new filler, we feel that you have a machine which will work very satisfactorily indeed.

The machine operates very smoothly without the jamming of cans and the accompanying loss of fruit and turns out a very uniform fill. We believe your estimate of capacity which you stated was 70 cans per minute to be very conservative, for we know this machine will operate very satisfactory on 95-100 cans per minute on cherries. We expect to put in more of these machines as the necessity arises and you may rest assured that we are perfectly satisfied with their operation.

FRUIT GROWERS CANNING COMPANY
BY Edw. S. Reynolds.

Colby, Wis., Nov. 27, 1923.

We wish to advise you that we are more than pleased with the hand bean filler, or rather as you call it, the Hansen Fruit and Vegetable Filler.

We were rather doubtful as to its capabilities until we tried it out. Wish to advise you that your filling hopper on same does not need attention, and with one girl supervising the fill of cans was all the help we needed in the canning of cut beans.

We have been complimented on the uniform fill of our beans and all we can say is we lay it all to your machine.

If you have any skeptics as to the capabilities of your filler, wish you would refer same to me or my superintendent at this plant and am sure we could soon change their opinion.

THE MEETING.

The Hotel Dupont is one of the best appointed hotels in the East, and it placed its handsome grill at the disposal of the Association. By 11 A. M. the members were all present, and President Chas. S. Stevens, in his characteristic way of wasting no time, announced the meeting in the grill, and lead off to set good example. The crowd was not slow in assembling, and it kept coming, until every seat in the large room was filled and others had to be provided. There was a good representation of canners, many brokers and plenty of machinery and supply men, and some others, but all members. For once the lobby was empty, while a meeting of canners was on, and it is a record worth recording.

President Stevens called the meeting to order at 11:10, and asked Dr. Symons, of the Extension Service of the Maryland University, to report on the plans for better tomatoes and corn.

Dr. Symons reported that the proposed work on better strains of sweet corn proved to be more expensive than at first thought, and that as the Legislature of Maryland had failed to make the appropriation requested, that work would have to be held in abeyance until next year. He showed the wonderful possibilities that might be expected from carefully selected strains of sweet corn. Individuals have been working on this for some years, and the Doctor spoke with regret of the severe loss in this, caused when the cannery of Saulsbury Bros., at Ridgely, Md., and who had selected strains of sweet corn covering ten years in the factory when it burned a few weeks ago. The Ridgely substation, however, is carrying on the work of careful selection, elimination of untrue strains and is persuing the line of seeking for hardy breeding in connection with that work at College Park; but he pointed out that it takes from three to four years to accomplish anything in this line.

Tomato Work—Dr. Symons reported the Community Plant Bed scheme as going ahead in fine shape, although about two weeks late owing to the unfavorable weather. He said he thought there were 35 beds in the State. He said some Dorchester county growers had decided to buy about two million southern-grown tomato plants in the hope of getting early tomatoes; and that the project was being watched with interest, as they were anxious to protect the State against root rot, wilt and other diseases likely to be brought in this way, and of which the State had always been free. Talbot County was also trying to produce early tomatoes by buying plants grown in Somerset Country. He stated that Mr. Radebaugh would report in more detail on this matter.

The Japanese Beetle Danger—Dr. Symons told of the Japanese beetle, which has found lodgement in this country, chiefly in New Jersey, and is likely to do much damage. It attacks all fruit trees, and most vegetable plants, and is so serious in its results that the Government has spent upwards of a million dollars fighting it thus far without much success. Quarantines have been established in badly infected places, but as the beetles fly easily from place to place, lodging in passing automobiles and other vehicles, it is spreading and will certainly be a visitor to Maryland this season. He said that if the sections which usually supply early tomatoes to Baltimore are infected, a quarantine against the shipment of them may be established.

THE PLANT BEDS

Mr. A. D. Radebaugh, in charge of the Community Plant Beds, wherein are grown the tomato plants to supply much of the acreage, responded when called upon and reported the beds as generally larger than last season and in much better condition; they are well prepared, carefully attended and watched and the plants making good progress. What particularly pleased him was that not only the plant bed growers, but a great many other growers were following the plant bed methods, preparing their bed carefully, sowing good seed, and dusting the plants to avoid disease. He said he had just returned from Indiana, where he had been talking to canners and growers, and he instanced the amount of plants needed by that State when it took 600 acres of plant beds to supply the State. They grow from 60,000 to 70,000 acres of tomatoes in that State, mostly for tomato product purposes. He commended Indiana for its good work in propigating improved seed, and said they had $7,000 in their treasury from the sale of seed of this high class kind. He said he wanted to see the canners of the Tri-State co-operate to this same end.

He said he had held meetings with the farmers in all sections, more of them than last season, though they were not quite as well attended. And he had visited New Jersey, as well as Delaware and helped on the work. He advocated the use of dusting rather than spray as being more practical.

He read the following list of plant beds in Maryland, explaining that generally the growers stood the expense and attended to the beds, taking their costs out of the sale of the plants, but not in all cases, and that their work was carefully watched and planned. He reported a very heavy "speaking" for the plants so far. The list is as follows:

County	Name of Person Conducting Plant Bed	Address	Size (acre)	Total Acreage	Community Plant Beds in County	Total Beds in County

A. K. Robins & Co., Inc., Baltimore, Maryland.

ROBERT A. SINDALL, *President-Treasurer* HARRY R. STANSBURY, *Vice-President*

Before closing Mr. Radebaugh warned the corn canners that they must be more careful in the inspection and trimming of the corn before canning, because too many worms were being found in the canned product. It was a rather gruesome experience to see a diner opposite the writer pick out of his plate, from among the very fine, tiny canned lima beans, a big fat brown worm. Any canner who could have seen it would have taken home the warning made by Mr. Radebaugh.

Work in New Jersey—Mr. F. W. Jackson, of the N. J. Extension Service was next called upon and reported that there were two beds in Salem County, and that they were in only fair condition. It was his opinion that there was a 15 per cent. increase in the acreage this season. He called upon Mr. Crissy, farm agent for the Fogg & Hires Co., for a more detailed report.

Mr. Crissy replied, saying that parts of Salem County were now under quarantine on account of the Japanese beetle, and that the fruit men were worried but not the others. Pennsylvania has become rather seriously infected, he said, because of the large number of automobiles traveling down through Jersey and then back into Pennsylvania. He said a good many farmers were following Mr. Radebaugh's directions and plans. He said they had gotten best results from potted Plants, and that the growers hoped to have tomatoes by August 1st by this method. He said they had done some work in improved seed selection, taking the best from 33 strains of Stone, and now had quite a sizeable lot of selected seed from their strains for this season.

Dr. McCue, of the Delaware Station, said they would get the Japanese beetle this season, as it had been reported only a few hundred feet from Delaware. He said one of the chief dangers is in the returned tomato baskets, and that they were studying some way to overcome this. He asked Mr. Phillips, of his station, and who had charge of the plant bed work, to report.

Mr. Phillips said there were seven beds working well in scattered sections of Delaware, after losing several from one cause or another. He said the beds had been unusually well prepared and will be watched and dusted as required.

THE LUNCHEON

At this point, without moving from the tables, a tasty luncheon was served to all by the Association, and a kind of recess taken for informal chats and considerations.

As soon as the dessert was finished the meeting was resumed.

The Traffic Bureau—Secretary Dashiell explained that during the absence of the President, owing to sickness, the Executive Committee held a session and decided to appoint a traffic manager for the Association, and had appointed to this position Mr. W. T. Gardner, who is connected with the Chamber of Commerce of Salisbury, Md., in the same capacity. In the short time that he has been at this work Mr. Gardner was able to make a very satisfactory report. He had had 58 letters and three claims adjusted. He had succeeded in getting the privilege granted to ship pulp in 5 gal., and No. 10 cans uncrated; had protested an advance of from 6c to 17c per 100 lbs. on canned foods to certain points in Louisiana and Arkansas; had protested an advance of 3c per 100 on canned foods from Delaware to New York City scheduled for May 15th, had protested the change of classification on strawberries in barrels from fifth class to third class, and was ready at all times to serve the members of the Association and merely asked that they communicate with him when any traffic problems come up. His address is given above.

The Growers Represented—Mr. C. C. Gelder, of the National Canning Crops Committee, U. S. Farm Bureau, was next called upon and responded on

CO-OPERATION OF CANNERS AND GROWERS.

It is a good omen for the canned foods industry, when canners and growers get together and talk over their common problems, for they together constitute the real producers, the growers the raw, and the canners the finished product.

The economists who have written and talked on the meaning of the word "co-operation" say that "it is the linking together of those whose interests are most closely related."

These two groups in production make up the real base of the canned foods industry, and each is dependent upon the other.

All other lines of business between production and consumption may be classed as middle-men, of greater or lesser necessity, with varying influence for good or evil upon the industry, many of which exploit the industry for selfish gain through a "bearish" effect upon both the spot and future market.

Controlling the future market in advance of planting and harvest, interferes with the operation of a true supply and demand market.

I want to make it plain that the growers have no fight with the legitimate canners; they want to co-operate with them, but they have a real fight with the predatory interests who sap the industry for their selfish purposes.

You are all familiar with certain brokerage and commission interests, who have issued circulars, and taken other steps which have operated against the canner and grower. Such concerns are as beneficial to the canned foods industry as the "Tea Pot Dome" crowd have been to the Government's oil interests.

Co-operative marketing increases the proportion of the consumers' dollar which goes to the producer, without increasing the price to the consumer.

The growers must co-operate one with another, the canners should co-operate in a like manner, and these two factors in production must co-operate together if the industry is to be stabilized and made safe and profitable to both branches of production.

If the canners would market co-operatively, they would shorten the route between can-house and consumer, with greater profits to themselves without increasing the cost to the consumer. Furthermore, they would distribute their product in an orderly manner over the annual period of consumption, instead of dumping during the short period of production.

The canner either spends his own time and travel expense calling upon individual growers, or pays a middle-man to do his buying. This expense is frequently higher than the grower pays for harvesting the crop. This production cost will be eliminated by the growers marketing co-operatively.

In most sections the growers to a large degree grow varieties of tomatoes which ripen at the same time, and in favorable crop years there is a peak load for about two weeks which over-taxes the physical capacity of the average can-house.

With a complete organization of the growers, the acreage of each grower can be so divided with two or more varieties so that his period of harvest will be extended. This will distribute the load for both canner and grower and improve the labor situation for both.

A partnership to endure must be equitable, likewise our industry must be profitable to both canner and grower, and this can never be under hap-hazzard speculative conditions.

LANDRETH'S SEEDS

When you think of Seeds, think of Landreth, either for spot or for future. We are the oldest Seed House in America, this being our 140th year. If we had not given good seeds, good attention to business, and fair prices, we would not have existed so long. Write us for prices on any variety, in any quantity, at any time.

D. LANDRETH SEED COMPANY

Established 1784

BRISTOL, PA.

In the past many growers have lost a season's work and expenses of the crop through making deliveries to irresponsible canners. Under co-operative marketing this would not exist, as the usual business credit relations would be employed.

These two systems of co-operative marketing can accomplish a great deal in stabilizing the market and preventing fluctuations which impair the credit of both canner and grower.

When we enter a season with more than a reasonable surplus of a commodity, what is more asinine than the growers to grow and the canners to pack their capacity? Yet we are going to have this unprofitable condition so long as canner and grower operate as individuals instead of co-operatively.

Unfortunately, too many people are concerned merely in the price they will pay, or are to receive, overlooking vital problems which, when properly taken care of, will automatically make the industry profitable to both branches of production.

We in Maryland are organizing the growers on a State-wide basis for 1925 under a five-year contract. Deleware and New Jersey say they are prepared to do the same. The three States have named a committee to draw up plans for the federation of the three States under one general sales organization.

We hope that you canners will be as co-operative as we are going to be, and if both organizations are headed up with the type of men who should direct them, we can settle our problems without an outside arbitrator.

Mr. W. H. Killian, president of the Canned Goods Exchange, expected to address the Association, but was detained at home through sickness, and Mr. F. A. Torsch, also of the Canned Goods Exchange, took his place in an able manner. Among other things Mr. Torsch asked how many generations it will take for the canners to learn that their best interests lie in helping each other, and not in trying to hinder and hamper fellow-canners. When they learn that their interests are identical they will learn to help and not be an obstacle, he said.

Mr. H. P. Strasbaugh, ex-president of the National Canners Associatoin, as also of the Tri-States, commended this business session of the Association, and urged the members to better co-operation. He moved that a committee be appointed to co-operate with the U. S. Farm Bureau, and upon being reminded that the Agricultural Committee was in existence, moved that it take this action with relation to that bureau. This was seconded and passed.

President Stevens then asked for a free discussion of the proposition of having all meetings for members only, and there resulted one of the best so-called 'round table discussions, free speaking, calling a spade a spade sessions which this Association has ever held. Mr. Hankins, of New Jersey, began it and a great many joined in. He asked for improvements in the buildings and the appearance of them; the planting of some flower beds, use of paint, etc., and suggested the term "packing plant,' rather than "can house,' as now generally used.

Mr. Wm. Silver asked why and how canners of this Association pay $2.50 per ton more for tomatoes than others, and then sell them at 15c to 20c per dozen less than those others. He said the weak market discourages the buyers, and his remarks were plain and to the point.

President Stevens said that costs had advanced on 1924 packings and that while most other canners saw the necessity of adding from 12½c to 15c to last year's prices many canners in this section had not added 2½c, and were selling futures below cost. He said the canners lacked the business ability to ask a fair price and stick to it.

Mr. Harris said that he would not mind paying $50 per year dues if the Association would appoint a field man to see that the packs of members came up to a standard which would make the Association famous.

All speakers were in favor of the closed meetings, and supply men and brokers voiced this same opinion. Upon being put to a vote it was unanimously carried to hold all meetings in the future for members only.

The comment in the lobby after the meeting was that it was easily the best meeting ever held by the Association.

END STACKING MACHINE

The End Stacker shown is designed to be placed adjacent to any of our various sanitary end producing machines where it is desirable to stack ends as discharged. It is also well adapted to any work such as baking powder, lye or cleanser bottoms, or any ends having straight or curled flanges. This device is built in two sizes, and being entirely automatic, receives and places the ends in a neatly stacked form. The object of this Stacker is to eliminate hand stacking and possible damage caused by excessive handling.

Adjustment is also provided to vary the height of the intake chute so as to correspond with the discharge of the machine to which it is attached. The can ends as received are stacked automatically from the bottom. The hopper has sufficient capacity to accommodate 36'' of ends and is so constructed that they may be removed without interfering with the continuous operation of the machine. The adjustment for different diameters is very simple and can be accomplished in a few minutes. The complete apparatus requires very little floor space and is provided with grooved pulley that allows it to be operated direct from the adjoining machine

DON'T LET CONGRESS CRUCIFY INDUSTRY.

Business-like Counsel Needed to Guide Legislators.

UNDER the main heading given above Mr. John M. Glenn, secretary of the Illinois Manufacturers' Association, in a special bulletin issued by them, draws attention to the fact that business is being attacked on every hand by Congress. He says that the situation is extremely serious and that business men are asleep. He draws attention to the fact that there are at least five bills on the road to passage which if not properly amended will work great hardship on the industries and bring about stagnation of business.

One of the measures which will have a big effect on industry is the proposal of Congressman Paige, which proposes to increase by 200 per cent parcel post rates.

If this measure is given the mature consideration that it deserves, and legislators are impressed with the importance of handling the matter in a business-like way, there is little danger that it will be passed in its present form. But if, due to hurried measures or undue pressure being brought to bear on the legislators, or the indifference of those interested, the measure is presented at a time when speed is being urged on Congress, there is a grave likelihood that it will be passed in its present form and disaster result.

The news flashed over the wires to the newspapers that Congress is preparing for all-night sessions to pass much-needed legislation, such as the Mellon Tax Reduction Bill, indicates a sincere desire for real accomplishment.

There has been too much delay on the part of Congress; now there is a feverish rush to catch up with much-needed legislation.

Our legislators are confronted with a dilemma—so many interests are clamoring for attention and the needs of the various classes are urgent. Apparently, the only way to get things done is to "rush them through."

Everybody is asking Congress to "get something done." Under pressure of this kind it is easily possible that the Paige Bill, which offers such an easy solution of the matter by increasing parcel post rates and other postage items, will be passed through without mature consideration.

To lay a burden of $150,000,000 on the farmer buyer at the present time would practically cripple his purchasing power. To tax $150,000,000 on one department of industry would result in stagnation of business in that industry. To attempt to operate a department of the postoffice with the rates increased as much as 200 per cent would practically put that department out of business.

Your legislators need the counsel of clear-thinking men. Write to them, pointing out the efficient, businss-like way to meet this situation—as the Postmaster General suggests, wait for his department report before taking hasty action.

MINUTES OF NATIONAL KRAUT PACKERS' ASSOCIATION, HOTEL SHERMAN, CHICAGO.

Chicago, Ill., April 22, 1924.

The meeting was called to order by President Wilder.

The minutes of the last meeting were read and approved. F. A. Vickers explained the necessity of standardization of cooperage and presented the following resolution:

Be it Resolved, That the National Kraut Packers Association accept and adopt the specifications and standards on fir cooperage as filed with the secretary for the correct and proper manufacture of kraut cooperage as to capacity, shape, size, and thickness of staves, size and thickness of heads, size and weight of hoops; further, that the cooperage manufacturers be requested to adopt individual identification marks, to be applied to all cooperage, and that such identification marks be registered with our secretary, and also that our association recommends that all kraut manufacturers specify these standards in ordering fir cooperage in the future.

It was moved and carried unanimously.

The following applications for membership were presented: California Packing Corporation, San Francisco, Cal.; Sterbach & Hoster, Philadelphia, Pa. Associate members—Walter J. Sears & Co., Chillicothe, Ohio; The Ohio Salt Co., Wadsworth, Ohio.

It was moved that they be elected. Seconded and carried.

Mr. B. W. Weller, chairman of the grading committee, explained the manner in which they have worked out definitions for determining good edible kraut—that the committee had several meetings and cut considerable samples.

TENTATIVE DEFINITIONS OF POINTS FOR DETERMINING GOOD EDIBLE SAUERKRAUT FOR BOTH BULK AND CANNED.

Flavor.

The kraut should have a normal acid flavor, indicative of a properly fermented product. It must never be bitter, sweet or rancid. Brine should show a salimeter reading of not more than 16.

Cut.

The shreds should be as uniform in length and thickness as possible, and the number of broad pieces of cores must not be excessive.

Color.

The color should be light straw or golden, neither white nor dark yellow; free from black or brown spots.

Crispness.

The kraut should be fairly firm in texture, without being tough. It must never be mushy.

Fill.

The fill must comply with all government regulations.

ROY IRONS, Sec'y-Treas.

AUSTRALIANS TO FIGHT FOOD FLY.

ALL of Queensland's fruit orchards are threatened by the ravages of the fruit fly. This pest has become especially prevalent in the Stanthorpe district, comprising about 1,000 square miles of fruit lands, where immediate steps must be taken to insure its destruction, says Consul Wormuth, Newcastle, in a report just received by the Department of Commerce. Authorities insist that the government take measures to provide for the destruction of diseased fruits in each infected orchard. "It is perfectly clear to anyone who knows the history of the Stanthorpe district," said one authority, "that either the fruit fly must come out on top, and the fruit industry go under, or the fruit industry survive by the absolute destruction of the fruit fly itself." All kinds of fruit grow in the infected areas, which is from 2,300 to 3,500 feet above sea level, and one of the principal fruit growing districts of Queensland.

BERLIN CANNING MACHINERY WORKS' NEW ADDITION

ALTHOUGH the Berlin Canning Machinery Works has one of the largest plants manufacturing canning machinery exclusively, in the United States, and has been manufacturing canning machinery for fifteen years, few of our readers have a chance to see their plant as Berlin, Wisconsin, is a little off the beaten trail, both by car and railroad.

The Berlin Plant was not developed in a single year, but has been built part at a time, by successive additions. from 1998 to 1924, there having been nine additions during this time.

At present the plant, part of which is shown by cut, consists of new boiler shop built this year shown in the foreground of the cut, in which is manufactured Kettles, Continous Cookers, Automatic Kettles and similar boiler and sheet iron work.

The next building. a one story building. is the main machine shop in which all machine parts are finished and small machines are erected. The next building is the foundry gray iron on one side and brass on the other.

On the opposite side of the railroad is the sheet metal shop, generally termed, tin shop, in which is manfactured custom built pea boxes milk trays, pea hoppers, etc.

The land area actually covered by buildings and passageways between buildings is approximately four acres.

The Berlin Canning Machinery Works first started manufacturing Sterilizers for milk canning factories, later developed a full line of milk canning machinery and later took on a complete line of pea canning machinery, tomato canning machinery, corn canning machinery and this year a general canning machinery line.

The development of this plant and organization has been slow and as they hark back to fifteen years when their present President went out and sold a machine, came back and carried iron for the molds, lay out the machines in the machine shop, did mechanic's foreman's and office work and sales work when he had a chance between times—to their present organization with a corps of salesmen, a fleet of sales cars and real mechanic's service—it makes them feel proud of the name "Berlin" when seen on canning machinery. And they have a right to be.

HOLDINGS OF TOMATOES MAY 13, 1924.

During last week we undertook to ascertain the spot holdings of canned tomatoes by Maryland and Delaware canners. Our investigation was as complete as it is possible for any one office to make. We have definite reports from 231 canners up to noon today, which give the following results:

25 canners have 97,620 cases of No. 10s.
38 canners have 94,764 cases of No. 3s
17 canners have 21,474 cases of No. 2s.
16 canners have 30,301 cases of No. 1s.

This report includes everyone of the large canners in Baltimore city except J. Langrall & Bro., Inc., and the vast majority of all the other canners in Maryland and Delaware who have any canned tomatoes at all. It shows a total of canned foods remaining in the hands of these canners of 248,159 cases of all sizes, which, if reduced to No. 3s, would be 201,444 cases.

This amounts to less than 3 per cent of the total pack in Maryland and Delaware of 6,938,000 cases, with 90 days remaining before new shipments begin.

Less than 3 per cent left in canners' hands, with 25 per cent of the consuming year left in which to sell them. The situation could not be much stronger than this.

Several canners who are holding tomatoes have not reported to us, but a careful study of the entire list of such packers convinces us that there are certainly less than 100,000 cases held outside of the above report, but if there should be a total of even 300,000 cases tomatoes yet remaining in canners' hands, which we are certain is an excessive estimate, we say, even then, the quantity is woefully short of the usual demand between May 15th and August 15th.

JOHN S. McDANIEL & CO., Inc.
Easton, Md., May 13, 1924. John S. McDaniel, Pres.

What Canned Foods Distributors are Doing

American Wholesale Grocers' Association Will Remove Headquarters to Washington, D. C.—Indications That Two Organizations Are About Ready to Bury the Hatchet.—News of the Week Among Canned Foods Distributors.

One of the most interesting pieces of news affecting the wholesale grocery trade for some time past comes out of Dallas, Texas, this week, where the American Wholesale Grocers Association is holding its annual convention. The Association, it is reported, has voted to remove its headquarters from Jacksonville, Fla., to Washington, D. C.

Considerable significance is attached to this move in the minds of the trade. For several years past, it will be recalled, relations between the two grocers organizations have been none too cordial. The National has resented the effort of the American to reach into the North for members, feeling that the American, or the Southern Wholesale Grocers Association, as it was formerly known, should confine its activities to the trade south of the Mason and Dixon Line. That there were jobbers in other sections of the country who admired the aggressiveness of the American's policy, however, is attested by the fact that it has succeeded in gaining many members in "National territory." This also holds true in the other direction, however, as the larger jobbers in the "American" or "Southern" territory are also affiliated with the National Wholesale Grocers Association in many instances.

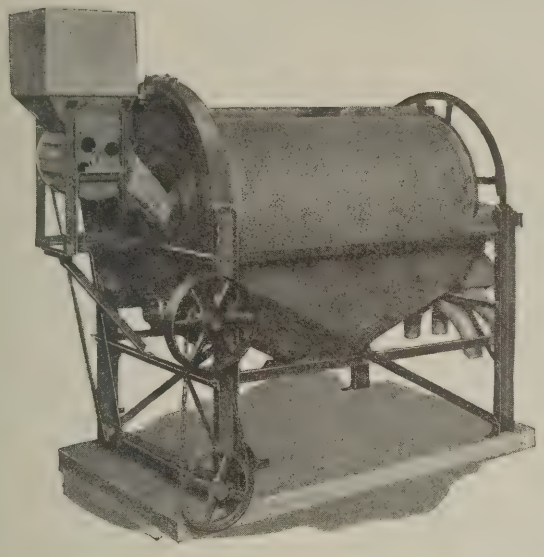
There are indications, however, of a desire on the part of leading wholesale grocers all over the country to get the entire trade of the nation lined up in one united organization, which could present a solid front on all important questions affecting the grocery trade as a whole.

Two or three past attempts to bring about amalgamation or mergers have failed, the failure being explained by the fact that the two organizations could not agree on a mutually satisfactory basis as to the method of running the combined organization. The truth of the matter, though, is that personal differences have largely stood in the way of any merger.

During the past two years, however, there has been more of a disposition shown by the two associations to work in harmony, the one outstanding exception being at the time the canned foods swell allowance was under consideration. At that time the American adopted a mild stand, calculated to give the canners an "even break" until the problems involved were proved. The National, however, took a stand which many canners considered arbitrary, and in the compromise which ended the incident for the time being the policy of the American won out.

It is understood that the only bar to an amalgamation of the two great grocery jobbers' organizations at this time is the question of the advisability of having a paid president. The American has such a leader in the person of J. H. McLaurin, who has served for many years. In the National the position is honorary. The contention of most members of the National seems to be that "a man at the desk" is needed to head the organization, as such an active wholesale grocer would be in close touch with actual trade conditions, whereas a paid executive, while he might call for the advice and suggestions of the active members of his organization, might make a false move at some critical time when an immediate decision on some problem important to the trade was involved. This difference, however, is not insurmountable.

The advantages of one large organization, taking in the industry as a whole, are manifest. In the first place, such an associatiton would be able to do considerable more statistical work. Another feature would be the probable establishment of a strong traffic bureau to help wholesale grocers in their rail and other traffic problems. The American at present has such a bureau, under the able management of T. D. Guthrie, but its sphere of activities would be widened materially were it under the control of a unified wholesale grocery organization representing the trade of the entire country.



Another benefit would be the concentration of all legal activities, such as the present fight against the abrogation of the consent decree, which is proving an expensive proceeding for each association.

It is not known whether or not definite overtures have been made looking toward a merger of the two associations, but leading members of each association are reported working for the plan, and it is probable that something concrete in this direction will develop at the National's convention in Chicago late this month.

The American Convention.—Early reports covering the proceedings of the American Wholesale Grocers Association in Dallas this week indicate that the jobbers are greatly stirred up over the prospect of having the meat packers and their "peddler" cars" in the wholesale grocery market as competitors again. Speakers before the convention pledged on the part of the wholesale grocers of the country a fight to the finish on this question.

A survey made at the end of the last calendar year, said President McLaurin, in his annual report, indicates that 1924 will be perhaps the most prosperous year for wholesale grocers since 1920. He also urged the repeal of the telephone and telegraph taxes by Congress.

The Nested Sample Grader—

Feeling the need of a "Sampling" Grader that was at once accurate, sturdy, of sufficient capacity, and compact, we developed the Nested Sampling Grader.

It has a frame of angle and channel iron which makes it as sturdy as possible to be built. Its hopper will hold over 30 lbs. of peas, making it possible for one man to grade, weigh and keep the records; for after putting the 25 lbs. of sample peas into the feed hopper, he can forget them until he weighs the various sizes.

It has four sieves, making 5 sizes. These sieves are fastened onto the same cast iron spider. This spider has teeth cut on the periphery, which along with cut mitre gears and chain, make a positive drive.

Its feeder is new and novel, having a rotory with buckets about its circumference. These pockets pick up the peas from the hopper and deliver them to the inner sieve. Thus, no matter whether the beginning or the end of the run, the feed is uniform.

For the canner who wants individual motor drive we can attach ½ H. P. Motor.

Manufactured and Sold by

Sinclair-Scott Company

Baltimore, Maryland.

Makers of Nested Pea Graderr, Colossus Pea Graders, and Other Canning Machinery.

WHAT IS SERVICE?

Service is the ability to do something of value and to do it better than it has ever been done before.

That canners in increasing numbers apply this standard to the use of

Wyandotte
Sanitary
Cleaner and Cleanser

is proved by the ever growing demand for this distinctive cleaner. This pure, snow-white, greaseless cleaner cleans quickly, easily and without harm to equipment or the hands of the user. It thoroughly removes dirt and objectionable matter and rinses freely. It deodorizes sour and stale places and leaves everything sweet-smelling and sanitary, at a cost surprisingly low.

THE SITUATION IN THE NORTHWEST

Puyallup, Wash., April 30, 1924.

You are interested in first hand information covering crop conditions of the various commodities you purchase. No crop that you buy is any more hazardous than bush berries. While the crop of the Puyallup Valley rarely suffers from weather conditions, yet occasionally difficulties will arise.

The writer of this letter has resided in the Puyallup Valley since 1890, or 34 years, and has had more or less supervision of the 25 acres of bush berries, therefore is entirely familiar with planting, fertilizing, cultivating, harvesting and marking.

Our Association keeps the grower constantly advised as to the next procedure through the medium of bulletins, a copy of one of which is enclosed herein. The growers depend upon the advice received from the office of the Association.

Now for your information, the year 1924 appears to be abnormal. You are entirely familiar with the present difficulties of the great sunshine State of California in lack of moisture, with the result that crop conditions in the southern state have been unusual.

I regret to advise that the bush berry crop of the Puyallup Valley has also had its difficulties owing to adverse weather conditions, as has also applied in all other berry sections of the Northwest, including Washington, Oregon and Idaho. It is too early to advise definitely covering the percentage of damage to our berry crop owing to severe weather conditions, but our growers are busy today removing all the new growth which has been damaged by the frost.

This new growth covers canes that will produce the crop of 1925. Each year the berry fields not only produce a crop of berries, but also a crop of canes on which the berry crop of the following year will be produced. In other words, each field has two functions to perform —one is to grow a crop of berries on the canes that came up last year, as well as to produce a crop of new canes on which the berries of the following year will be produced. This means that each winter the cane that produced the preceding season is cut out and removed from the field.

The necessity of cutting out the new cane, just now about 6 inches high, will materially retard the growth of the cane for 1925 berry production, but to what extent it is hard to advise. You can appreciate that if the weather was sufficiently severe to destroy the new growth of canes, it was also sufficiently severe to do damage to the cane which will bear the berry crop of 1924. Just how severe the damage to the berry crop of 1924 is, we are unable to advise, but the frost damage, as you can appreciate, has not been helpful. On the contrary, it has been harmful, and it is the opinion of the writer that the crop of berries produced in the Northwest States for 1924 will show a shortage of considerable magnitude, as compared with the crop of 1923.

Western Washington canners and many Oregon canners receive their Bartlett pears and Royal Anne cherries from Yakima, Wenatchee and Walla Walla districts.

Appreciating your interest in these commodities, I am submitting herewith reports from those who should know in relation to the frost damage, not only in the Puyallup Valley, but in the Bartlett pear and Royal Anne cherry districts of Washington. Please accept this information for what it is worth, which is sent to you in good faith.

This for your information. No matter from whom you buy your canned berries, it would be well to get busy.

W. H. PAULHAMUS, President.

PINEAPPLE PACKS OF SINGAPORE

THE Foodstuffs Division of the Bureau of Foreign and Domestic Commerce has received a statement of the pack of pineapples for the last two years at Singapore, Straits Settlement. These statements are based on information furnished by one of the largest shippers at that point.

There are two pineapple crops called the "Winter Pack" and the "Summer Pack"; winter pack extends from November to February, and the summer pack from April to July.

1922 Summer Pack estimated at 500,000 cases.
1922-23 Winter Pack estimated at 250,000 cases.
1923 Summer Pack estimated at 550,000 cases.
1923-24 Winter Pack estimated at 275,000 cases.

The whole of the packing is done in and around Singapore, all shipments being made from this port.

Hereunder is a list of actual shipments made during the two years in question:

	1922	1923
London	250,784	345,778
Liverpool	284,097	287,234
Other ports in U. K.	51,058	20,029
Continent	39,474	46,812
U. S. A.	38,774	41,000
Canada	4,329	5,151
Other ports	7,732	9,775
	676,248	756,579

1924 RED BOOK

Thirty years ago Orrin Thacker began the publication of a directory of wholesale grocers. Every year since there has been published a new edition of this directory, the 1924 edition being the thirtieth consecutive issue. Because of its red cover, the Orrin Thacker Directory is known as the Red Book.

In the 1924 Red Book are listed 4,810 exclusively wholesale grocery houses, 979 semi-jobbers and 331 grocery chain firms. These names are listed alphabetically by States and cities, and the financial size of the firms is designated. Populations of States and cities are given, and counties in which the cities are located are designated.

Especially do salesmen appreciate the Red Book, because of its convenient size. Although containing more than six thousand names, this directory is so compactly arranged that it measures only about four by six inches and is less than one-half an inch thick. It can easily be carried in the coat pocket.

Sales managers, advertising managers and other executives also find the Red Book very useful. It is carefully compiled and contains a very accurate list of exclusively wholesale grocers, semi-jobbers, chain store operators, etc.

This directory is published by Orrin Thacker Directory, 33 West Gay Street, Columbus, Ohio, and it sells for $2 per copy, postpaid.

CANNED FOOD PRICES

Prices given represent the **lowest** figure generally quoted for lots of wholesale size, usual terms f. o. b. Baltimore (unless otherwise noted) and subject to the customary discount for cash. ****Many canners get higher prices for their goods; some few may take less for a personal reason, but these prices represent the general market at this date.

Baltimore figures corrected by these Brokers: (‡) Thos. J. Meehan & Co. (†) Jos. Zoller & Co., Inc. (§) A. E. Kidwell & Co. (*) Howard E. Jones & Co. New York prices corrected by our special Correspondent.

The Markets

BALTIMORE, MAY 19, 1924

WEEKLY REVIEW

Everywhere the Season Is Reported Backward—Crops Are Late and Canners Are Beginning to Be Uneasy—Too Much Rain and Too Little Sunshine and Warmth. Market Very Quiet—No. 2 Tomatoes Advanced—Holdings Very Light.

BACKWARD—One section after another reports the season at least two weeks late, with the crops all waiting for more seasonable weather. Up in Maine, where they should be planting corn and beans, the weather has continued cold, wet, and the ground unbroken and preparation for canners' crops far behind. Naturally, the canners are beginning to hedge on any further orders for late plantings, and the fact that it must be sometime yet before they can begin operations on planting bring the crops within the frost danger period of the fall.

New York State is in the same position—the weather cold, wet and unseasonable, with severe storms and heavy rains. Just the kind of weather where all hands have to sit around and wait, and then what is equally as bad, if the warm weather does come around it will have to be present for 'quite a spell" before the ground will be fit to work. No need to say that many fear that once the warmth begins it will come on heavy and dry, and the young crops just starting will be burned up. Nature, many think, will equalize matters, making up with a rush for the lack of warmth to date.

Here is what Frank Inbush Co., of Milwaukee, said on May 10th:

> "Rains continue to interfere with planting schedules. Within a radius of forty miles from Milwaukee fields are covered with water. Some sections of Central Wisconsin have faired somewhat better, however, and a number of the canners have planted two-thirds of their Alaskas and one-third of their sweets.
>
> The sun is shining today for the first time in over ten days, and the thermometer shows signs of raising over the 42° mark, where it has hovered for a number of days.
>
> The late planting season and the uncertainty of favorable growing weather has caused many canners to hesitate about taking on additional future business."

In their letter the week previous they had spoken very optimistically about conditions, saying that while some delay and trouble had been experienced, there was time and probability of good plantings and crops.

This covers the top strata of the country, and you can just write dittos (") under any part of the country below it, for the whole country is making a record for coolness and unseasonable spring weather. Here we are approaching June and there has not been enough heat to make a light top coat, or even an overcoat, feel uncomfortable. The ladies have not even begun to wear furs as yet.

In Maryland and this section generally we are following a record wet April by a record wet May. Floods have caused much damage in the western part of the state, and following down the Potomac River, have washed the soil from farms. down to the rock strata, and at Fredericksburg, Va., carried away the buildings of a cannery. And with it all fires in the homes have continued comfortabe and necessary in most cases. At least, that is a peculiar spring, and there has been a lot of time losot.

Elsewhere we publish the Government's figures on the prospective tomato acreage for 1924. We do not know how they secured this, nor on what it is based, as much of the acreage has not yet been contracted and more of it not yet planted, but their figures show an increase of about 10 per cent. over last season. The wish is father to the thought in this, we believe, or in other words, that that would about represent early intentions. What will ultimately be done remains to be seen and is dependent upon the weather. Most tomato land, however, is sandy and the frequent and heavy rains have not hurt it. Chief trouble has come from a lack of bright sunshine and warmth.

What crops have been planted are doing quite well, the pea crop coming on slowly, but well; strawberries promise a big and abundant crop; and fruit trees, and fruit of all kinds, looks most promising.

The Market—The brokers of this city echo the reports of other cities—canned foods are dull, with no life to them. A few stray orders come along and that is all. Some of the dealers are getting testy, as men do when business is off, and are inclined to find fault with anything or everything. Everyone is watching the market and hoping.

No. 2 spot tomatoes have been in such heavy demand and the amount on hand has so steadily dwindled that the price is mounting and the $1.05 today may be $1.10 by the time you read this on Monday morning. That does not look like a quiet market, but the trouble is that all hands have let their supplies get down to such a low point that any slight stoppage in the stream means that they will be caught without any tomatoes. It has been reliably estimated that there are not 300,000 cases of tomatoes, figuring everything down to No. 3s, in the Tri-States at this time, and there are three of the heaviest consuming months yet to be supplied. A normal consumption of tomatoes is a million cases a month, at least. The answer must be perfectly plain.

Future tomatoes are weaker if anything. We don't know how to explain it, if there is any explanation possible. If there is any jobber not well covered at present prices he must be too blind to be allowed to run loose. But we don't believe both sides of the operation are suffering from the same malady. Futures will probably improve from now on, or they should. Indiana and other sections are about out of the market as far as further business is concerned.

Corn has been weaker. Some holders seem anxious to clean out, and they are letting go. Good corn, however, can command its own price, at least in the fancy lines.

The canners are taking some spinach, but they are paying too high prices for the raw stock, $1 per bushel when 25c would be nearer correct. The crop is not plentiful and the weather is against it. The market is firm with a tendency to advance.

Some pineapple is coming to town, and the canners are touching it lightly. Now it comes in by way of New York, in crates, and a carload looks large. There are those who prefer this pineapple and the Baltimore style of canning, and it it this trade that is being filled.

A stroll through canning centers does not cheer one up for business looks dull and sounds so, when it should be cheery with spring promise.

Apples seem to be about gone, as is also pumpkini, and the job now is to find stocks. There is the widest variance in prices quoted by different canners or holders, as much as 20c per dozen on some items. The holders either do not know the market or have no confidence. Generally speaking, any buyer in the market has come to buy, forced there because he must have the goods. He quibbles for lower prices, but would pay what is asked if it were firmly held.

NEW YORK MARKET

Market Quiet—Buyers Very Cautious—Chain Stores Buying Canned Foods—Tomatoes Weak—Fruits Improving in Demand—More Interest in Corn—Notes of the Trade.

By "New York Stater,"
Special Correspondent "The Canning Trade."

New York, May 15, 1924.

BUSINESS ROUTINE.—There has been a continued quiet market for canned foods reported on the spot position during the past week, and the situation has shown no important alterations. Distributors are unwilling to let go their control of the market, and so are operating only in small lots, and are avoiding any undue support to the price structure. Jobbers are reluctant to buy in advance of their requirements, even when they are assured of a strong probability of an advance in prices before they can get into the market again. Hand to mouth, with resale based on replacement cost, seems to be the watchword.

Chains Active.—The chain stores are booming the sale of canned foods, and continue to make the canned foods department a strong feature of their daily advertising. Many of them, however, are able to offer only broken lines to their trade, and are picking up odd lots under packers' brands to fill in gaps caused by total clearance of their holdings of private brands.

Future Tomatoes.—California canners are now quoting on 1924 pack, for shipment from canners from the southern part of the state. The opening prices are 82½ cents on standard 1s, $1.00 for 2s, $1.15 for 3s, and $3.75 for 10s, with solid pack at $1.00 for 1s, $1.25 for 2s, $1.60 for 3s, and $5.25 for 10s. The demand at these prices has been rather quiet thus far.

Southern Tomatoes.—There have been no further developments in the market for future tomatoes in the South. Canners are not as strong in their views as development in other markets would seem to justify, but distributors are not inclined to take advantage of what many concede to be the probable low point for the new season. There has been some call for spots, with the market for 2s in particular strong. The inside is 97½ cents per dozen, f. o. b. factory, for packers' labels, but many sellers appear to believe that $1.00 or $1.05 more nearly represents the market value of their holdings.

Salmon.—More interest is being shown in offerings of new pack at fixed prices, and offerings are still reported at $1.95 for pinks and $2.35 for reds. The larger packers, however, continue to refrain from offering futures until they know the full extent of the governmental fishing restrictions in Alaska this season. The packers are still having trouble in signing up fishermen for cannery work; owing to the refusal of the fishermen's union to accept the terms offered by the canners this season. A feature of the offerings of the new pack at fixed prices by some packers has been the various guarantees against decline, competitors' prices, etc., which packers are offering. Demand for Columbia River salmon on the basis of opening prices named last week has been fair.

Canned Fruits.—Buyers are picking up odd lots of canned fruits wherever available, and it is expected that there will be a material shortage before the shipments out of the new pack can reach this market. As noted before, the scarcity is particularly marked on standard grades. Cling peaches are virtually cleaned up on the Coast, and $2.00 to $2.05, f. o. b. cannery, is the usual asking price.

Why Not a Good Southern Peach?—From time to time trade members whose acquaintance with canned foods dates back before the war days turn to a discussion of California canned peaches versus Eastern canned peaches. There is no doubt but what the California peach is the prettiest pe. that is canned commercially today, but there are peaches produced in other parts of the country which have a little something on the Pacific product when it comes to taste. Of course, the buying public has been educated to buy by looks, rather than taste, but it seems logical to suppose that there are enough consumers to furnish a good market for some Southern canner, who can get good peaches and can keep them just as good after he gets them into the can. Jersey has packed some wonderful peaches off and on during the past few years, but no one packer seems to have made a specialty of a real high-grade product of this kind.

Standard Corn.—There was a little more interest shown in offerings of standard corn this week, and the market appeared fairly steady around 97½ cents per dozen, f. o. b. cannery, for prompt shipment. Stocks in the hands of distributors here are not large, and buyers are in the market right along for small quantities to take care of the orders which are now reaching them. Extra standard is variously quoted at $1.00 to $1.07½ f. o. b. Southern cannery, and the market for futures has stiffened in sympathy with the strength which the spot article has been showing.

Sardines.—Packing of Maine sardines has not yet become active, and the canners are shipping out the fish as fast as they are put up. Thus far it is not believed that any of the packers have been able to accumulate a surplus from the 1924 pack, and inasmuch as the pack of 1923 was practically sold up, the undertone of the market continues to rule firm.

Leave for Convention—M. L. Toulme, secretary of the National Wholesale Grocers' Association, and John B. Newman, confidential assistant to President Herscher, left on the midnight train for Chicago last night to arrange the last minute details of the National's convention at the Hotel Congress.

Notes of the Trade.—Dr. J. T. Dorrance, president and general manager of the Campbell Soup Co., sailed yesterday on the steamship Berengaria for a visit to Europe.

C. W. Wolf, sales manager of the J. C. Ainsley Packing Co., canners of Campbell, California, was in the market this week.

V. A. Seggerman Co., Inc., have been appointed local sales agents for the Michigan Fruit Packing Corporation, of Grand Rapids.

R. C. Paulus, former manager of the Oregon Growers' Cooperative Association, has entered the brokerage business at Salem, Oregon, and will specialize in canned fruits.

Dan Gerber, of the Fremont Canning Co., of Fremont, Mich., was a visitor along Hudson street last week.

C. O. Hogan, of the Dixie Packing Co., of Mobile, Ala., was visiting at the offices of Butler & Sergeant, Inc., here this week.

L. F. Graham, of J. H. Fleckinger Co., canners, of San Jose, Cal., was a trade visitor this week.

J. V. Beckmann, resident Pacific Coast buyer for the Great Atlantic and Pacific Tea Co, was visiting headquarters at Jersey City this week.

A. L. North, of North & Dalzell, made a short trip to Chicago during the week.

W. S. Sanford, president and director of Sanford & Timpson, local brokers, has sold out his holdings and retired. The business will be continued under the same firm name by A. H. Timpson and L. F. Bridges.

CHICAGO MARKET

Spots Too Scarce to Allow Active Market—Buying from Each Other—Corn Leading in Sales—Iowa Ahead of Last Year in Future Corn Sales—Tomato Dealings and Information Scarce.

By "Wrangler,"

Special Correspondent "The Canning Trade."

Chicago, May 16, 1924.

THE MARKET for canned foods is reported by brokers and buyers too be quiet. The spot market could not very well be active, because the supplies of canned foods in first hands and almost exhausted in every line. Even canned pumpkin and No. 10 apples are getting to be hard to find, as most supplies are sold up. The wholesale grocers are buying quite a quantity of canned foods from each other which, though inconvenient and not altogether pleasing to the buyers, is a measure that is necessary on account of scarcity of supplies in the possession of the canners.

Canned Corn.—The freest selling article in canned foods at present is probably canned corn, as the supply of this article is better, perhaps, than that of most any other article in canned foods. The supply of standard quality $2 corn is holding firmly at $1.00 per dozen, f. o. b. factories, in all the central western states. The supply of spot canned corn in Iowa is about exhausted. It is not known what the situation in relation to spot corn is in Indiana, Illinois or Wisconsin, as the secretaries of the canners associations for those states do not give out information in relation to either the spot supply or future sales, a policy entirely different from that of the Iowa and Nebraska Canners Association, which regularly gives out accurately compiled figures in relation to both spot and future canned corn.

The Secretary of the Iowa Association reports that 1,600,000 cases of canned corn have been sold for future delivery out of the pack of 1924 yet to be made. This is contrasted with the sales to the same date last year of about 1,240,000 cases of future corn of the pack of 1923, and shows that Iowa canners have sold futures up closely to the safety line. There are almost three good heavy selling months for canned corn yet to come, and it is unquestionably the case that the spot supply will be entirely exhausted unless the holdings in Illinois, Wisconsin and Indiana are underestimated by those of us who are compelled to guess because the state associations of those states do not furnish information.

Canned Tomatoes.—There is an absolute quietude from Indiana sources in relation to canned tomatoes. Nothing is being said in relation to the plants or planting, or as to any small spot holdings that remain in the hands of canners, if any, in Indiana who are willing to take on contracts for canned to-1924. Brokers report that they are unable to find any canners in Indiana who are willing to take on contracts for canned tomatoes for future delivery, and in the absence of official information we will have to let it go at that. The buying of canned tomatoes by wholesalers in the central west is being done altogether from Delaware and Maryland, with a few from Virginia. The understanding is that the No. 2 size has advanced sharply in Maryland and Delaware, and that it is being held for from $1 00 to $1.10, according to the nominal prices which are being fixed by each packer on his holdings, while the No. 1, No. 3 and No. 10 sizes are being neglected.

No California canned tomatoes are coming to Chicago this season. I have repeatedly given the reason for this avoidance of California canned tomatoes by consumers of the central west and the refusal, therefore, of dealers to buy or handle them, which is that they are packed with puree, and the consumers of the central west do not want puree when they buy canned tomatoes; they want canned tomatoes. They are willing to take with their tomatoes in the can a little water, because they realize tomatoes are largely composed of water, and that in processing them the water is bound to exude and appear in the can, but they do not like puree with their tomatoes. I understand that New York and some of the eastern consuming districts have become accustomed to puree packed tomatoes from California, but the west tried them for several years, and came to the conclusion that the consumers did not like them.

Canned Peas.—The supply of canned peas is so closely exhausted that a general expression of opinion in relation to the market cannot be made. Prices for spot peas are entirely nominal, and every little lot of canned peas has its own market price without conference or consultation with any other lot. Sales of standard No. 4 Alaskas and No. 5 sweets have been made to Chicago buyers in a small way recently by Wisconsin canners at $1.40 and $1.50 per dozen.

Canned Apples.—The supply of No. 10 spot canned apples is almost exhausted. A few in Michigan are being offered at $3.00 per dozen f. o. b. factory, and a few sales were made last week, but the enormous cold storage supply of barreled and boxed apples is still with us in the warehouses, and the pie bakers will not buy No. 10 canned apples so long as they can buy barreled stock, except in a very small way, for immediate convenience. New York State is offering some canned apples, but is holding their price up pretty firmly to $2.85 to $3.25. I understand that the exportation of apples in barrels and boxes is very heavy, and this may have the effect to clear out our loaded cold storage warehouses.

The indications from various apple-growing districts are to the effect that the crop is going to be good, and that it has not been injured by frost so far in any locality that I have heard from. Therefore, it behooves canners to be very careful about packing any large quantity of canned apples next season, unless there should be a change in the crop prospect from that now known.

General Information.—The surplus of canned pumpkin carried over by western canners is well sold out, and there are only a few very small lots still available.

New canned rhubarb is being offered by Michigan and other canners at prices slightly lower than the opening price of last year. It is a little early to give information in relation to the crop outlook for bush berries and strawberries in Michigan, but the report from Oregon, Washington and Idaho is that the frosts out there have been seriously damaging to raspberries, blackberries, loganberries and gooseberries, killing the latterals or canes that grow up this spring to bear berries in 1925, and damaging the old crop canes which bear this year to the extent of about 50 per cent decrease as compared with last year.

Bartlett pears and both sweet and sour cherries in these northwestern states are said to be damaged by frost to the extent of about 50 per cent yield, as compared with last year.

I have heard of the receipt of the first lot of 1924 pack of Maine sardines, and that the quality was exceedingly poor, and that there were a number of rejections. I did not hear a description of the objections to the quality, but merely heard that the goods had been rejected by local buyers.

Canned salmon is selling more freely, as is incident to the approach of spring and summer, but there is no free or large selling. The usual contracts for fancy chinook canned salmon to be used for private labels have been made, but I have heard of no carload sales of the other kinds for prompt shipment from the Pacific Coast, as most of the buying seems to be done from consigned stocks in warehouses in Chicago in 50 to 100 case lots.

ST. LOUIS MARKET

Some Little Market Improvement Noted—Shortages in Many Commodities—Tomatoes Quiet—Corn Firm and Scarce—String Beans Wanted—Fruits in Better Demand.

By "Missourian."

Special Correspondent "The Canning Trade."

St. Louis, May 15, 1924.

THE MARKET—While the canned foods market is dull, and there is little doing in tthe vegetable and fruit lines, however, during the first few days of this month there was a little more liberal covering of wants than there was during the last week in April, because at that time there was a decided falling off for all staples. There is less than normal business being done, even at this time.

Buyers of the leading houses have been instructed to purchase only in small quantities. In fact, they have been restricted to a hand-to-mouth policy. The conservative buying does not seem to be the result of the prevailing condition or likely to take place in the market, but to some outside influences.

Shortages are common in many commodities and all grades are affected alike, as all dealers are in about the same position, that is have light stocks. No one seems to be inclined to buy in advance of his requirements. Brokers and canners seem to suffer more than the jobbers, because the latter are fairly well occupied.

Tomatoes.—Tomatoes are quiet. Southern are firm in No. 2s and these lead all other sizes in volume of business. There has been a fair demand for California standards for coast movementt. There is little interest in futures.

Peas.—Peas are firm. There is a marked shortage in the cheaper lines. Supplies of standards are in second hands, and are offered sparingly at premium prices. Fancy gradings of No. 2 and 3 sieves, in both Alaska and sweets, are in freer demand. It is said that in some cases the demand for 4s and 5s have let up, and in some cases 3s and 4s are being substituted for them in order to reduce the holding of the latter. Desirable peas can only be found in second hands.

Corn.—Corn is a routine seller. It is quiet in standard but firm and scarce in fancy.

Miscellaneous.—String and stringless beans are wanted, but are scarce. New pack California and Southern spinach is attracting considerable attention and prices are being maintained. Southern spinach is available for immediate delivery, and is being taken for nearby requirements, as working stocks are scarce. New pack asparagus is coming in on contract and is going out in standing orders.

Fruits.—With the primary market about cleaned up on 1923 pack, there is a livelier interest shoown in available stocks. Stocks of California lines are being depleted at the canner's, and while there is better spot business, it is confined mostly to pick ups. Standard cling peaches are wanted and desirable assortments are short and few are available, but buyers are not inclined to pay coast prices, although little is being offered. Kieffer pears are scarce and firm and are in fair demand, so are apricots and cherries. The former are in no suplus and rule easy. Cherries are sometimes shaded by weak sellers. Pineapple is steady. Apples are not attracting much attention. Futures are attracting some notice, but a majority of buyers are not inclined to take up liberal supplies subject to approval of price. Northern berries and Southern packs are in some demand.

Fish.—The market shows no material change. Inquiries, however, for many lines are taken as an indication of approaching shortage in distributing hands.

Milk.—Condensed milk is quiet and there are no changes in price. Trading is more or less restricted. Evaporated milk is also unchanged.

F. M. Thompson, manager of the West Plains canning factory, has erected and equipped a new canning factory at Mountain View, Mo., which will be in operation this summer.

CALIFORNIA MARKET

Opening Prices Being Held as Long as Possible—Most Lines Went to Higher Than Last Season—Effects of Dry Winter Being Felt—Frosts Hurt Oregon Crops— Peaches Cleaning Up—Salmon Canners Come to Terms With Fishermen's Union—Javanese Canned Foods on Display.

Special Correspondent "The Canning Trade."
By "Berkeley,"

San Francisco, May 15, 1924.

OPENING PRICES.—Opening prices are due on a number of lines of California fruits and vegetables, but packers are withholding announcements as long as possible in order to more accurately determine costs. A few small operators have named prices on future tomatoes, but the large packing interests have not put out lists, although these are expected shortly after the middle of the month. Opening prices on fruits promise to be a litle late, as crop conditions are not fully settled and prices for canning stocks are still up in the air. Most lines will be higher in price than last year, since prices to growers then were generally below the cost of production. Values are expected to strike an average this year which will prove somewhere near normal. They will not approach the extremely high levels reached immediately following the war, nor will they be too low for growers to make a profit.

Crops.—Crop conditions are getting down to a fairly settled basis, although all danger from frost is not yet over, as was proved during the past week, when fruits and vegetables were nipped in several of the mountain valleys. The chief source of worry now, however, is over the problem of securing sufficient water for irrigation. The effects of the dry winter are being felt throughout the state, and fruit will run to small sizes where orchards are not properly irrigated, cultivated and thinned. The harvesting of the cherry crop is commencing and canning operations will be under way shortly. From the present outlook the California crop will be about 60 per cent of that of last year. Most packers have a carry-over and growers are being urged to ship as much of this fruit to the fresh markets as possible. The Oregon crop has been damaged by frost and the canned pack in that State will be reduced materially. The prospect of reduced packs in both California and Oregon has had its effect on the spot market and cherries are moving better than for some time. The cling peach crop in California has been damaged by frost, and will be about 85 per cent of that of last year, according to the latest estimates. The crop of freestone peaches promises to be about the same as that of a year ago.

Peaches—Stocks of spot cling peaches are rapidly cleaning up and some pacers have very little to offer. The California Packing Corporation is quoting standard No. 2½ yellow clings at $1.95 f. o. b. canneries, but stocks are so low that this grade may be withdrawn almost any time.

Peas—The packing of peas will be commenced very soon, but the output in California will be woefully small, owing to the drought. Pro rata deliveries will have to be made and some packers having connections in Utah will make deliveries of mountain peas instead of the California article.

Salmon—The differences which have been existing between the salmon packers operating out of San Francisco and the Alaska Fishermen's Union in regard to the price to be paid for fish have been settled and salmon packers are now winging their way to Alaskan waters. A few vessels of the Alaska Packers' Association sailed earlier in the season with non-union crews, but most of them remained at anchor until the wage scale settlement. Under the terms of the compromise agreement it is specified that the men shall receive eight cents a fish. The fishermen had been holding out for eight and a half cents, while packers wished to reduce the price to seven and a half cents.

Figs—Opening prices on California canned figs have been named by the California Peach and Fig Growers' Association, of which E. S. Moorehead is sales manager. The list is slightly under that of 1923 and the prices quoted are for September and October delivery.

Japanese Products—A very comprehensive display of Japanese products is being made at 549 Market Street, San Francisco, by the Japanese Commercial Museum, and canned products are shown in an interesting variety. The North American Mercantile Company, 330 Front Street, is featuring its "Namco" brand crab meat, as well as French style mushrooms, chop suey sauce, "Hokkigai" clams and bamboo sprouts. The Ono Trading Co., Ltd., 315 California street has a display of "Blue Flag" canned crab meat, while Okada & Co., 220 Montgomery street, is displaying their "Uroko" brand of canned crab meat.

Coast Notes—W. V. Cruess, associate professor of fruit products in the University of California, Berkeley, has returned from a six months' trip abroad, where he made a careful study of fruit growing and packing. At Cambridge, England, he visited Prof. Kidd's laboratory for research in the cold storage of fruit and found that this investigator had developed a method of storing fruit in carbon dioxide at room temperature. The process included the use of a relatively low concentration of the gas, about twelve or fourteen per cent, instead of the high concentration used in America unsuccessfully. The new method is being used by the Chivers & Sons Preserving Co. on a commercial scale. Prof. Cruess was especially interested in the work of the cannery and by-products school of the University of Bristol. The school is located at Campden and is under the direction of Prof. Barker and Prof. Appleyard. Some interesting results have been secured in the utilization of surplus apples. In speaking of olives Prof. Cruess expressed the opinion that a market could be developed in England for the California ripe product, which is practically unknown there. He found the leading grocers and hotel men interested, and states that it would undoubtedly pay California packers to

investigate the English market.

James D. Dole, president of the Hawaiian Pineapple Company, Ltd., Honolulu, was a recent visitor at San Francisco, and has since left for Los Angeles, preparatory to making a trip to New York. In commenting on the probable size of this year's pack Mr. Dole stated that this would doubtless parallel that of last year. Much development work is being done by his company on the Island of Lanai, and some planting has been done there. Within three years large quantities of pineapple should be available there.

The annual picnic of the California Packing Corporation will be held May 21 at the Mt. Diablo Country Club, and the officers of this concern at San Francisco will be closed on that day. The annual entertainment and dance was held late in April.

The Stayton Cannery Company has been incorporated at Stayton, Ore., with a capital stock of $35,000, by G. A. Smith, George Keech, John Dozler, Henry Fangman, Joseph Walz, R. D. Hoke and George H. Bell.

MAINE MARKET

Cold Weather Adds to Worries—Much Ground Untouched, Although Time for Planting Corn—Canners Withdrawing Futures—Clam Pack Over With But Small Surplus—Sardines Still Scarce.

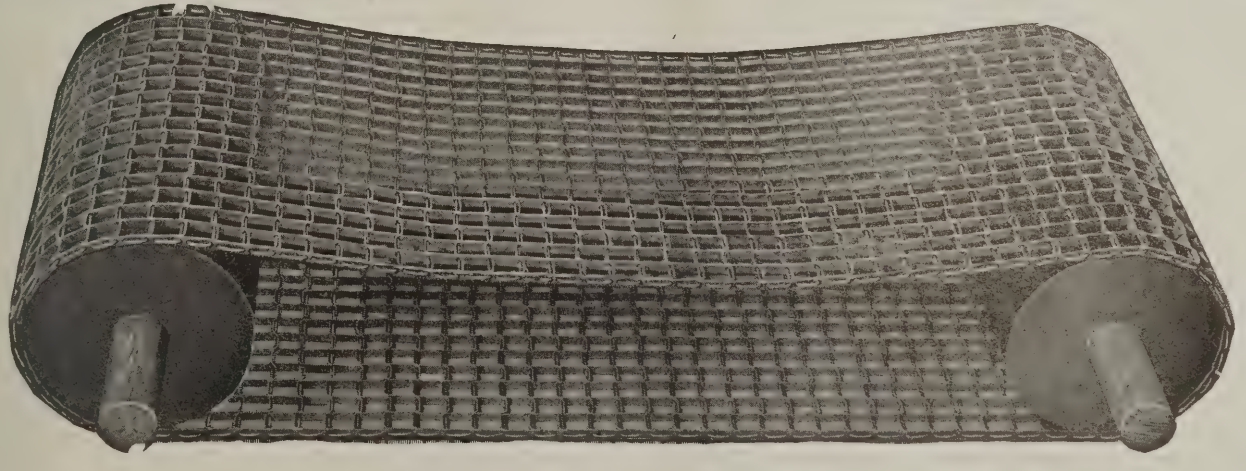
Special Correspondent "The Canning Trade."
By "Maine,"

Portland, Maine, May 16, 1924.

COLD WEATHER.—Every passing week of this cold weather adds to the hazard of trying to can vegetables in Maine this season. Much land intended for corn raising has not yet been worked up, although it is already almost time to begin planting. Even should the sun come out warm and bright tomorrow, corn planting would be at least two weeks late, and the season retarded that much. The usual time for putting in corn is from May 20 to June 10, stringless beans from May 12 to 25.

Future corn is, therefore, growing more scarce and more valuable every day. The offerings are far below the usual amount at this season, and now canners who did not consider their sales completed are inclined to withdraw from the market. The prices remain as quoted throughout the season, $1.70 for Golden Bantam and $1.45 for Crosby.

Small lots of spot corn have been traded this month at good prices. The stocks today are not sufficient for the usual early summer demand. Principal sales have been on yellow corn, at about $2.10. Crosby is wanted, but is hard to find.



The clam pack has practically cosed this week, with contracts filled and a small surplus on hand for current orders to carry until the fall pack comes on. Canners feel satisfied with their season's work, as they feared at times that they would not be able to take care of their contracts. Stock came in better than was anticipated, and a satisfactory quantity was produced.

Sardines are still among the missing. Herring have not appeared in local waters, and no work of any amount has been done. Canners report that they do not look for any activity for a fortnight at least. Future contracts are being offered at $4.35, even in face of the fact that there have been no fish received at this time.

Lobster canning is also progressing very slowly, which is usually the condition in early May. June will doubtless see more work, though a heavy season is not expected, due to difficulty in getting fishermen to work on satisfactory terms.

C. W. Hedley, representing Bel-fast Adhesives, is calling on Maine canners and making his headquarters with the local representatives, J. B. Greene Co.

HERCULES SANITARY FLEXIBLE STEEL CONVEYOR

The sanitary belt with the square mesh. Used for all conveying purposes, on Sorting Tables, Scalders, Washers and Exhausters. Made any size. Easily cleaned and durable. If your dealer doesn't handle, write for catalogue and prices.
